THE ENCYCLOPEDIA AMERICANA

Campos, **Arsenio Martinez**, ār-sā'-nē-o mar-tē'nēth kām'pōs. Spanish military officer: b. Segovia, Spain, 14 Dec 1834; d. 3 Sept. 1900. He was graduated at the Military Staff School in Madrid and appointed a lieutenant in the army in 1858; served on the staff of Gen. O'Donnell and became chief of the battalion in the Morocco campaign of 1859; was on duty in Cuba with the rank of colonel in 1864-70; took part in suppressing the Carlist insurrection and was promoted brigadier-general in 1870; opposed the republic after the abdication of King Amadeus, and was imprisoned as a conspirator. Under a plea for permission to be allowed to serve as a private, he was released and given command of a division in the 3d Army Corps in 1874. In the next two years he was constantly fighting the Carlists, distinguishing himself at Las Munecas and Galdames and causing the noted siege of Bilbao to be raised. With Gen. Jovellar, he called Alphonso XII. to the throne; was made commander-in-chief of the Catalonia district, and crushed Don Carlos at Pena de la Plata in 1876. For these services he was promoted captain-general. In 1877 he was appointed commander-in-chief in Cuba, and brought the revolution to a close chiefly by means of concessions which, as minister of war and premier in 1879, he endeavored unavailingly to carry out. He was minister of war in 1881 and 1883, commander of the Army of the North of Spain in 1884-5, president of the Spanish senate in 1885; and captain-general of New Castile in 1888. In April 1895 he was appointed governor-general and commander-in-chief in Cuba, and in January 1896 he was recalled to Spain. He found the insurrection more formidable than he had anticipated, and his failure to pursue a vigorous war policy caused much dissatisfaction in Spain. On his arrival in Madrid he repeated his belief that the trouble in Cuba could only be ended by granting reforms.

Cam'pra, An'dra, French composer: b. Aix, Provence, 4 Dec. 1660; d. Versailles, 29 July 1774. He ranks among the most distinguished composers of operas, his themes being

classical love stories, notably 'The Triumph of Love'; 'The Amours of Mars and Venus'; 'Hippodamia'; etc.

Campus, the name given in most colleges to the recreation ground more or less enclosed by the college buildings. At Harvard the space here indicated is known as the "yard."

Cam'pus Mar'tius (called also, by way of eminence, *Campus*, merely) was a large place in the suburbs of ancient Rome, consisting of the level ground between the Quirinal, Capitoline, and Pincian hills, and the river Tiber. From the earliest times it seems to have been sacred to the god Mars, from which circumstance it received its name. It was originally set apart for military exercises and contests, as also for the meetings of the comitia by tribes and by centuries. In the later period of the republic, and during the empire, it was a suburban pleasure-ground for the Romans, and was laid out with gardens, shady walks, baths, etc.

Cam'pus Scelera'tus, a name given to a spot within the walls of Rome, and close by the Porta Collina, where those of the vestal virgins who had transgressed their vows were entombed alive, from which circumstance it took its name.

Campvere', now **Veere, Vere**, or **Ter-Vere**, Holland, a maritime town in the province of Zeeland and the island of Walcheren, four miles north-northeast of Middelburg, on the Veerschegat, a sea-arm which separates Walcheren from the island of North Beveland. It is fortified, entered by four gates, has a harbor, a town-house, and a market-place, but its trade has greatly decreased. It is historically interesting as being a place where the Scotch had a separate community and various privileges. Pop. 9,000.

Camuccini, Vincenzo, vīn-chēnt-zo ka-moo-chē'nē, Italian historical painter: b. Rome, about 1775; d. 1844. He followed the pseudo-classical style, and his pictures are of large size. Among his best-known works are 'Death of Cæsar'; 'Death of Virginia'; 'The Incredulity of Thomas'; 'Horatius Cocles'; and 'Death of Mary Magdalene.'

DEPARTMENT OF

CANADIAN HISTORY AND DEVELOPMENT.

Canada, Dominion of. Outline History and Political Development (1534 to 1904).

When the Dominion of Canada came into existence in 1867 the word "Canada" received a wholly new signification. Its origin is doubtful but it was applied loosely in the early time to the regions occupied by France on the Saint Lawrence, called by the French themselves New France. When in 1763 France surrendered her North American territory to England the term "Canada" was commonly used for the new British dominions. In 1774 these dominions, including part of the Canadian Northwest and what is now the northern tier of western American States, were officially called the "Province of Quebec." Canada does not appear technically until 1791, when the name was used in a constitution given to Upper and Lower Canada, practically the Quebec and Ontario of the present time. Later these Provinces were known as Canada East and Canada West. Not until 1867 did Nova Scotia and New Brunswick become a part of Canada. In considering the history of Canada as we now understand the word, it is important to remember that it includes a separate record of detached provinces, Nova Scotia, New Brunswick, Lower Canada, Upper Canada, etc., until 1867.

In the succeeding articles the epochs in Canadian development are treated in detail. It is sufficient here to outline the chief phases of Canada's history. The first of these, the age of discovery in the 16th and early 17th centuries, has received much attention, but there is still great obscurity as to the range of French effort on the Saint Lawrence. Jacques Cartier (q.v.) and Champlain (q.v.) are the most honored names in this pioneer work. Though few details are known, an extensive fur trade and fishing industry existed in the Saint Lawrence region long before the end of the 16th century. Early in the 17th century French trading companies were fighting for the monopoly of this trade.

The second epoch is that of French colonization and exploration until the final struggle with Britain for the country. When the first pioneer efforts were over France undertook the serious work of colonization, with Quebec as her centre of influence. Her aim was to transplant French social life to North America. Huge grants of land were given to seigniors who were to play the parts of lords in Canada, with vassals looking to them for light and leading and paying rent for the land which they occupied. The system was wholly uncongenial to the new world, but it survived during the whole period of French supremacy and is a picturesque and interesting if not a successful feature of French colonization. See CANADA — SEIGNIORIAL TENURE.

The first permanent settlement apart from

trading posts occupied only in the summer was at Port Royal, now Annapolis, in Nova Scotia. Here the French planned really to till the soil and develop the country. From the first the colony had a terrible struggle for life. In 1614 the English from Virginia destroyed it and after it was restored to France in 1632, the adjacent American colonies were always planning to drive out the French. After a chequered history they at last succeeded in 1710, during the reign of Anne, in taking final possession of the Colony, and it became Annapolis. The quiet village of the present day was thus the object of strife between two nations for well nigh one hundred years.

Samuel de Champlain was one of the pioneers at Port Royal, but in 1608 he turned to the Saint Lawrence and made the beginnings of Quebec (q.v.), long the centre of political and commercial life in Canada. By instinct Champlain was an explorer. Like others of that and a later time he hoped that the Saint Lawrence would in some way lead to a water route to China. To Lake Huron and Lake Ontario Champlain penetrated, but the obstacles were enormous. The Iroquois Indians were hostile to the French from the first, and it is hardly strange that with their menace added to the natural difficulties Champlain could do but little to lift the veil from the North American interior.

Nor was he left free from European rivals. The English followed the French to the Saint Lawrence. Quebec they attacked and captured in 1629, and over it the English flag floated for three years. When in 1632 France recovered the place the fortunes of Canada were committed to a great commercial company. This Company of "One Hundred Associates" was to be lord of the land and to have in its hands the work both of trade and of settlement. In France it had the powerful support of Cardinal Richelieu, but when at Quebec in 1635 Champlain died, New France lost its ablest leader, and the Company the most effective exponent of its interests. In the end it failed. Both in India and in America in the 17th century the French commercial companies failed where their English and Dutch rivals succeeded.

After 1635 Canada was the scene of varied activity. It was an age of religious zeal in Europe, and the Jesuit and other missionaries planned to convert and control the savage native tribes of the country. In what is now Northern New York, in Ontario, and in Quebec the missionaries did heroic work. Since the French missionaries were the friends of the Huron tribe, the relentless Iroquois bent on destroying the Hurons, pursued the French too. By 1649 the Huron settlements and the French missions were alike destroyed, and the French were driven back for a time to their base at Quebec. They had founded Montreal in 1640,

CANADA — OUTLINE HISTORY AND POLITICAL DEVELOPMENT

but it was long only a fortified outpost to check the Iroquois.

But missions represent only one, if the dominant, phase of French interest. The great interior exercised all the fascination of the unknown upon the chivalrous minds of the French explorers. La Salle, Marquette, Joliet (q.v.) are only the best known of the leaders who penetrated to the interior before 1700. On Lake Huron, Lake Michigan, Lake Superior, on the Mississippi, even in the Far West of Canada and the United States the survival of French names to this day bears witness to the activity of these explorers. It was a French Canadian, La Vérendrye (q.v.), who first crossed the continent so far as to view the Rocky Mountains, but this was not until 1743.

Between missions and discovery the slow and laborious work of colonization was in danger of being forgotten, but there grew up gradually on both sides of the Saint Lawrence and near the mouths of its tributaries, colonies of French farmers. The river was their highway. For protection from the Indians they lived as close together as possible and so they divided the land into long narrow strips with the houses stretching in a line on the river front. To the present day it is the most conspicuous feature of the French Canadian farms. Colonization was slow work. Adventurous Frenchmen preferred the wild life of the forest, and it was so difficult to attract settlers that in 1700 there were hardly more than 6,000 Europeans in the whole of New France. They enjoyed no semblance of political liberty. Between an aggressive church and a governor with the ideals of Louis XIV., the subjection of the French *habitant* is in striking contrast with the liberty of New England. Towards the end of the 17th century New France was committed to a very able Governor, Frontenac (q.v.). He had a definite programme. He would curb the Church, which aimed to exclude settlement from the interior so that the missionaries might be alone with and continue to control the Indian tribes; he would hold back the English, build a chain of forts from the Saint Lawrence by the Great Lakes and the Ohio to the mouth of the Mississippi to shut them out from the West, and finally drive them into the sea. It was a great plan, but it required resources beyond anything that France could command. In Europe she was fighting William III. of England and his allies, and needed all the strength she could muster. So Frontenac died in 1698 with his plans unrealized, but he had done a definite work. The mission stage was ended in New France. Entrenched on the Saint Lawrence and soon on the Mississippi France was ready to engage in the supreme struggle to make the interior French and to build up a great transatlantic empire for the glory of the French nation.

The next epoch in Canada's history covers the prolonged struggle resulting in the British Conquest. Probably impossible of realization in any case, the plan of a French empire in America was ended by Louis XIV.'s misfortunes in Europe. With a great alliance against him, he was obliged to make the Peace of Utrecht (q.v.) in 1713. In this he surrendered his claims to Hudson Bay, to Newfoundland and to Nova Scotia. This was the beginning of the end. Though in Cape Breton France built a great fortress, Louis-

bourg, so as to command the Saint Lawrence, and though she still held the country tributary to Quebec, the odds against her were too great. Walpole managed to keep Great Britain at peace until 1744, but when war then broke out France and England engaged in a final struggle for North America. The Treaty of Aix-La-Chapelle (q.v.), in 1748, did not really bring peace. Both sides were preparing steadily for renewed conflict. On the Ohio, on the Atlantic Coast, on the Great Lakes, on the Saint Lawrence, a deadly conflict went on after 1755, and when on a September day in 1759 Wolfe (q.v.) defeated Montcalm (q.v.) before Quebec, the issue was at last decided. By the Treaty of Paris (q.v.) in 1763, France surrendered her dominion of New France to Great Britain.

The fourth epoch in Canadian history covers British rule from 1763 to the Confederation of the Provinces in 1867. After the conquest in 1763, Canada was for a time governed by the British without creating a special constitution for the country, and not until 1774 did the Quebec Act (q.v.) provide for a permanent system. The Quebec Act played a great part in both American and Canadian history. It set up a despotic system of government, and it aimed to bring the whole western country under this despotic régime at Quebec. While introducing British criminal law in the country, it re-established the French civil law. The seigniors retained their feudal rights, the Church was given legal power to collect the tithe.

In the English colonies the Quebec Act caused discontent. They did not desire despotism as a neighbor, they did not wish to be checked in the west, they disliked the legal establishment of Roman Catholicism; and when the colonies revolted the Quebec Act was one of their grievances. They resolved to attempt the overthrow of British rule in Canada and allied, as they hoped, with the conquered French rising against their new masters they planned to make the revolt continental in character. But in 1775 the American army under Benedict Arnold failed to take Quebec; and the French showed fight on behalf of Great Britain. Soon the plan to drive the British from Canada was abandoned and the country remained firm in its British allegiance.

Probably with Arnold's failure the die was cast finally; it is certainly true that the intervening 130 years have never seen any serious prospect of the union of Canada with the United States. When the Loyalists, driven from the United States, found a home in Canada they treasured bitter memories of the revolutionary struggle and rendered the prospect of union even more remote. But once settled in Canada these refugees from the United States demanded the self-government which they had enjoyed at home, and at last in 1791 the British Parliament established Lower Canada and Upper Canada each with a legislature of its own and with some, though not a complete, measure of self-government. In 1812 the United States and Great Britain drifted into war, and the second failure at that time to overthrow British rule in Canada confirmed the results of the defeat of Arnold. Beyond domestic conflicts, more than once resulting in bloodshed, Canada has known no external warfare since 1812-14.

In 1837 there was armed rebellion in the two

CANADA—OUTLINE HISTORY AND POLITICAL DEVELOPMENT

Canadas. In Upper Canada the inhabitants claimed the complete control of their own affairs that the Colonial Office in London persistently refused, and to vindicate this demand a few took up arms. In Lower Canada there was a war of races. The French majority demanded that they should dominate in the councils of the country. The English minority, allied usually with the Governor, resisted this claim, and at length some of the French also appealed to arms. Each revolt failed completely, but the risings threw into a clear light the causes of discontent in Canada and in time a remedy was furnished.

Lord Durham, an English radical Whig, sent out to rule Canada with despotic authority and to restore order, in a very able report, published in 1839, urged that the English Province and the French Province should be united under one legislature. This was done. In 1841 Canada received a new constitution, and, joined together for the first time, the people of the two provinces could demand respect and consideration. With more than a million people Canada could no longer be treated as the child of the Colonial Office. After a few doubtful years under the new constitution, the Earl of Elgin, one of the Governor-Generals sent out from England, definitely, amidst some riotous events in 1849, recognized the supreme authority of the Canadian Parliament in regard to Canadian affairs. Since that time political warfare in Canada has been between Canadian parties and not between Canada and the Colonial Office.

But the union of the two provinces contained nothing of finality. Lord Durham had hoped that the English would dominate the French. Instead the French asserted themselves and since each province equaled the other in the number of its representatives, the work of government under the party system proved extremely difficult. A better political temper was growing up throughout British North America. Once free to control their own affairs the provinces saw the advantages of union. Their insight was quickened when in 1866 an advantageous Reciprocity Treaty with the United States came to an end, and in self-preservation it became necessary to increase the commercial and political strength of the provinces. With surprising rapidity negotiations were successfully concluded between 1864 and 1866, and in 1867 the Dominion of Canada came into existence.

The events connected with Confederation furnish a distinct epoch in Canadian history. In the next and concluding epoch the various provinces have been welded together until a real national life has appeared. The development of Federal Government in Canada presents some interesting contrasts with the Federal system in the United States. Sir John Macdonald (q.v.) aimed to make the Federal power strong, the Provincial power relatively weak, and, since his was the master mind that directed Confederation, the Canadian constitution reflected his views. The powers of the provinces are strictly defined, the undefined residue remaining with the Federal Government. Carrying out his views Macdonald frequently tried to curb the provinces, and answering him there was a cry for provincial rights. In spite of Macdonald's desires, development in Canada has been rather in the direction of strengthening the authority

of the provinces, but it is still true that a province in Canada falls far short of a State of the Union in political authority. The Federal Government can disallow Provincial legislation, it can dismiss a Provincial Lieutenant-Governor and has done so more than once. But as a result of nearly forty years' experience a fairly stable balance between the two jurisdictions has now been reached. During this time a real unity has grown up in Canada, and it makes Canadians, as it long since made Americans, one in sentiment from ocean to ocean.

Bibliography.—A good, though in some respects defective, bibliography of Canadian history will be found in 'Literature of American History, American Library Association Annotated Guide,' edited by J. N. Larned (1902). Only a short list of the best general histories and of those dealing with special periods need be noted here. Francis Parkman devoted his life to the history of New France and his collected works (12 vols., numerous editions) form the standard history of French rule in Canada. Kingsford's 'History of Canada' (10 vols., 1888-98) covers the whole subject down to 1841. J. C. Dent's 'Story of the Upper Canadian Rebellion' (2 vols., 1885), and his 'Last Forty Years; Canada Since the Union of 1841' (2 vols., 1881), may be used to supplement Kingsford's work to bring the history down to the present time. Roberts' 'History of Canada' (1904) is the best short history. McMullen's (2 vols., 1896) is fuller.

Turning to special periods Biggar's 'Early Trading Companies of New France' (1891), with extensive bibliographies, is the best account of early discovery. Read in connection with Parkman's 'Pioneers of France in the New World,' it gives an adequate account of the early period. For the later period of French supremacy by far the most interesting mass of material is contained in 'The Jesuit Relations and Allied Documents' (73 vols., 1896-1901). Parkman's work is the best connected narrative account of the period. The story of the British conquest of Canada is well told in Bradley's 'Fight with France for North America' (1901), while Doughty and Parmelee's 'Siege of Quebec' (6 vols., 1901), is a unique and exhaustive account of that aspect of the struggle. For a brilliant narrative of the Conquest and its preceding struggles Parkman's account in his 'Half Century of Conflict' (2 vols.), and his 'Montcalm and Wolfe' remains unequalled.

The works of Kingsford and Dent above cited are not rivalled by any special monographs on Canadian history for the period between 1763 and 1840. For recent times Pope's 'Memoirs of Sir John A. Macdonald' (2 vols., 1894), and Willison's 'Sir Wilfrid Laurier and the Liberal Party' (2 vols., 1903), cover the ground adequately. Sir John Bourinot's 'Canada Under British Rule' (1900), is an admirable short sketch, while his 'Constitutional History of Canada' (1901), is the best manual dealing with the subject. 'The Review of Historical Publications Relating to Canada,' edited by the present writer and Mr. H. H. Langton, is an annual bibliography, with extensive critical reviews of the literature of each year relating to Canada (Toronto, The University Library).

CANADA—THE ERA OF EARLY DISCOVERY

Canada—The Era of Early Discovery.—

The early history of Canada from 1497 to 1632 may for the sake of convenience be divided into our periods: (1) The period of the early explorations along the Atlantic seaboard, 1497-1533; (2) the discovery and occupation by the French of the gulf and river St. Lawrence, 1534-43; (3) the rise of the fur-trade, 1544-1612; and (4) the first permanent colonization, 1613-32.

The Explorations along the Atlantic Seaboard, 1497-1533.—The first European to set foot on British North America after the departure of the Northmen in the 11th century was John Cabot (q.v.) of Bristol. Though born in Genoa, Cabot had removed in 1461 to Venice and by his naturalization in 1476 as a citizen of that republic had been able to trade to the Venetian factories throughout the Levant. When on a voyage to Alexandria for spices he made up his mind to push on to Mecca, then the great mart for the transfer of eastern and western goods. He wished to learn the situation of the region where the spices grew. On questioning on this subject those in charge of the spice-caravans at Mecca, they told him that they received them from other caravans coming from further eastward to whom they had in turn been handed over by others coming from still more remote regions. It seemed clear to Cabot that the spices must grow on the very eastern confines of Asia. In that case would it not be more practical to bring them direct to Europe by sea across the western ocean? With this idea in mind Cabot removed with his family from Venice to London. In England he learned that in the summer of 1480 an attempt had been made by two ships from Bristol to find the island of Brazil to the west of Ireland. Under Cabot's direction fresh efforts were made to find both this island and that of the Seven Cities which should but form stepping-stones on the new route to Asia by the west. All was to no purpose. No islands or land of any sort could be discovered. Suddenly, however, in the summer of 1493 news reached England that another Genoese, Christopher Columbus, had sailed out into the western ocean with three Spanish ships and had succeeded in reaching the Indies. Cabot and his friends were roused to fresh efforts. During Henry VII.'s visit to Bristol in the winter of 1495-6 Cabot proceeded to set before him the advantages to accrue to England could intercourse be opened between that country and Asia. London would become in a short time a greater emporium for spices than was then Alexandria itself. As a result of this interview letters patent were issued on 5 March 1496, giving Cabot and his sons permission to sail to Asia under the English flag. Armed with these powers Cabot fitted out at Bristol a small vessel called the *Mathew*. Her crew consisted of but 18 men. Owing to various delays they were not able to set sail until Tuesday, 2 May 1497. Rounding Ireland, they first of all headed north and then west. After many weeks of varied winds, land was at length sighted at 5 o'clock on Saturday morning, 24 June. On the 53d day after leaving Bristol they had reached the most easterly point of Cape Breton Island. The royal banner was unfurled and as the ship's

boat rounded her keel on the beach, perhaps of Mira Bay, John Cabot stepped ashore and in solemn form took possession of the land in the name of King Henry VII. No inhabitants were seen, but the sailors found snares set for game and a needle for making nets. It was, therefore, judged that the country was inhabited. As the climate was agreeable and the soil fertile, they were of opinion that they had reached that portion of the coast of Asia where grew the spices Cabot had seen at Mecca. The modern Cape Breton was named "Cape Discovery" and Scatarie Island which lies opposite, "Saint John's Island," as the day was the feast of Saint John the Baptist. Sailing north along Cape Breton Island they gave to Cape Ray the name of "Cape Saint George," and called Saint Pierre, Miquelon and Langley islands the "Trinity group." Since their provisions were none too plentiful should the return voyage prove a long one, they spent no time in further exploration and early in July set sail for home from Cape Race which they named "England's Cape." Favored by the westerly winds of the North Atlantic, they made good progress and on Sunday, 6 August, the *Mathew* dropped anchor once more in Bristol harbor. Cabot hurried to Court and on the following Thursday, 10 August, was given a reward of £10 for his successful discovery. According to Cabot's report he had found some 700 leagues to the west of Ireland the country of the Great Khan. Although silk and brazil-wood grew at the spot where he landed, it was his intention on the next voyage to proceed on down that coast till he reached Cipango, for in his opinion this was the region whence came the spices and precious stones he had seen at Mecca. Henry VII. was delighted and granted Cabot a yearly pension of £20. On 3 Feb. 1498 new letters patent were issued authorizing Cabot to prepare a fresh fleet of six vessels. In order to secure skilled seamen and probably also to hear news of what Columbus had done, Cabot about this time made a trip to Lisbon and Seville. In Lisbon he came across a certain João Fernandes, called "Labrador" because he owned land on the island of Terceira. When Cabot informed this man of his discovery, Fernandes in turn told him how he himself had also visited a region to the west of Iceland and north of the point in Asia reached by Cabot. The latter's curiosity was roused. Here was perhaps a shorter way of returning to Asia than by crossing again the dreaded western ocean. On Cabot's return to Bristol with Fernandes, a brief consultation with the merchants of that town who had long traded to Iceland convinced everyone that this was the best route to take. By the beginning of May the two vessels manned by 300 men were in readiness. Since it was known that Cabot was taking the route via Iceland, "in his company sailed also out of Bristowe three or foure small ships fraught with sleight and grosse merchandizes, as course cloth, caps, laces, points, and other trifles." Early in June they reached the east coast of Greenland a little north of Cape Farewell. As Fernandes had already told them of this region they named it the "Labrador's Land." On coasting north along this desolate shore, they found the ice to grow steadily thicker and heavier and the

CANADA—THE ERA OF EARLY DISCOVERY

explored the Bay of Fundy and then followed the coast southwards as far as the West Indies. On his return to La Corunna with a ship-load of Indians he was understood to say he had spices. The excitement was great for it was believed he had reached the Moluccas. Ultimately the mistake, which was due to the similarity of the words for slaves and spices in Spanish, was explained and afforded the emperor and his court much amusement. In 1527 two English vessels, the *Samson* and the *Mary-of-Gilford*, the latter being a three-masted barque of 250 tons' burden, were sent out to find a northwest passage. On meeting with icebergs at the mouth of Davis Strait they headed south. On 1 July in 52° a storm separated them and the *Samson* was never heard of more. The *Mary-of-Gilford* on reaching Saint John's on 3 August found "eleven saile of Normans and one Brittainne and two Portugall Barkes and all a fishing." Finding no news here of the *Samson*, she continued her course to the south "oftentimes putting her men on land to search the state of those unknown regions." On one of these occasions the Italian pilot, who may possibly have been Giovanni Verrazano, who had explored this coast for Francis I. in 1524, was killed by the Indians. In the middle of November the *Mary-of-Gilford* reached the West Indies. Being refused permission to enter San Domingo, she set sail again for England. In the course of her voyage she had met more than 50 French, Portuguese, and Spanish fishing-vessels, which shows the proportions to which the cod-fishing on the Banks had then attained. Each year in fact the numbers increased.

The Discovery and Occupation by the French of the Gulf and River of Saint Lawrence, 1534-43.—Though during the course of the first three decades of the 16th century various English, Portuguese, French, and Spanish expeditions had explored the seaboard of eastern North America none of them had penetrated into the interior. The first to do this were the French in 1534. The French fishermen who resorted every summer to that portion of this main coast which was rich in cod had noticed that a bay, called by them the "Bay of Castles" from the formation of the land thereabout, extended so far inland that not one had ever been able to reach the head of it. It was just possible, therefore, that this might be the entrance to a strait similar to that found by Magellan in the south. On this being reported to the authorities at home an expedition was dispatched from Saint Malo in the spring of 1534 under the pilot Jacques Cartier with orders to explore this opening. Cartier reached Bonne Espérance harbor inside the Strait of Belle Isle (then called the "Bay of Castles") on Wednesday, 10 June. Having discovered on examining the coast beyond this point with the long-boats, that it was completely barren and rocky, sail was made on Monday, 15 June, from Bonne Espérance harbor in order to explore the land seen to the south. Following this south shore of the Strait of Belle Isle they were led steadily down the west coast of what we now call the island of Newfoundland. Off St. George's Bay to the north of Cape Ray they had stormy weather for a week, which forced them to beat up and down. On resuming their

course southward they fell in with the Bird Rocks which lie 55 miles north-northwest of Cape Breton Island. The island to the south of these they named "Brion Island" after the Admiral of France. From the currents observed here Cartier surmised that the opening beside Cape Breton Island was a strait and that one could sail from Brion Island directly into the Atlantic. "Should this prove to be the case," added Cartier, "it would mean a great saving both in time and distance should anything of importance be discovered on this voyage." As is well known, this opening, Cabot Strait, is now used quite as much as the Strait of Belle Isle. Leaving Brion Island on Saturday, 27 June, they crossed over to the Magdalen Islands, of which they coasted the northwestern corner until the following Monday, 29 June, when on the wind veering to the south they had to set sail toward the west. They were under the impression that these islands formed the main shore on the south side of the gulf, and when on Tuesday morning, 30 June, they reached Cascumpeque Bay in Prince Edward Island, they believed that this latter formed part of the same main shore with the Magdalens. The western end of Northumberland Strait, which separates Prince Edward Island from the mainland, was mistaken for a bay and called "Saint Leonore's Bay" in memory of a Breton bishop whose festival is celebrated on 1 July. Coasting northward along the New Brunswick shore they believed on reaching Chaleur Bay that they had at last found a passage into the South Sea. On Thursday, 9 July, they discovered that it was merely a deep bay; "whereat," says Cartier, "we were much put out." On account of the heat experienced there they christened it "the Bay of Heat." Pursuing their course northward they entered Gaspé Bay, where they were detained for ten days by bad weather. On Friday, 24 July, the day before they set sail, they set up a cross 30 feet high as a landmark and also seized the two sons of an Indian chief who had come down to the sea with his tribe to fish. Rounding the peninsula of Gaspé, they were heading straight for the mouth of the Saint Lawrence, when one of the mirages so common in those parts led them to believe that this passage between Gaspé and Anticosti was merely a land-locked bay. They consequently crossed over and followed the south shore of Anticosti as far as the eastern extremity of that island. Continuing on along the north shore of Anticosti they at length caught sight of the Quebec coast opposite and saw that they were entering a passage which they called "Saint Peter's Strait." At this point a consultation was held at which it was decided that since there was a great probability of this passage being the one they were in search of, it would be advisable as the season was late to postpone their exploration of it until the following year. They consequently headed east along the north shore of the gulf and were finally brought back to the Strait of Belle Isle or the "Bay of Castles," whence they had set out. The fishermen's statement had been fully confirmed. This narrow opening had turned out to be a great gulf with probably a second entrance into the Atlantic near Brion Island. There was also a prospect that the

opening they had just discovered in the north-west corner of this gulf would yet lead them into the South Sea. Setting sail from Belle Isle on Saturday, 15 August, they reached Saint Malo in safety on Saturday, 5 September. As they were in great hopes that the opening in the northwest corner of this large inland gulf would eventually lead them to the South Sea, a fresh expedition consisting of three vessels was sent out under Cartier in the spring of 1535 in order to explore it. Passing through the Strait of Belle Isle and along the north shore of the gulf they anchored on Monday, 9 August, in a small bay on the Quebec shore, opposite Anticosti. As the following day was the feast of Saint Lawrence, this bay was christened "Saint Lawrence's Bay." The name afterward spread by mistake to the whole gulf and was finally extended to the river. The two savages who had passed the winter with Cartier in France, now informed him that the land on the south side of this Saint Peter's Strait was an island and that further west he would come to the mouth of a very large river. Where that river rose they did not know. With this information to help him Cartier proceeded through the passage north of Anticosti and passing on up the gulf entered the river Saint Lawrence or as the savages called it the "River of Hochelaga." On arriving at the mouth of the Saguenay his Indian guides informed him that this river took its name from a kingdom lying toward the northwest which was "rich and wealthy in precious stones." Pleased with this information Cartier pushed on up the "River of Hochelaga" until he reached a large island which he named the "Island of Orleans" after Francis I.'s third son, Charles, Duke of Orleans. On the banks of a small stream which here enters the Saint Lawrence stood the home of the two Indians who had passed the winter in France. For this and other reasons Cartier laid up his two largest vessels in this stream and with his third vessel and two long-boats pushed on westward to visit another Indian village called Hochelaga. The shallow water at the head of Lake Saint Peter, which he named the "Lake of Angoulême" after Charles, Duke of Orleans, checked the further progress of the sailing vessel which had to be left behind here. Pushing on in their long-boats they reached the Huron-Iroquois village of Hochelaga on the island of Montreal at the foot of the Lachine rapids on Saturday, 2 October. On the following morning a visit was paid to this village and an ascent was also made of a mountain near at hand which Cartier named "Mount Royal." From this point they had a magnificent view of the surrounding country. They specially noticed the rapids, which checked further progress westward and heard from the savages that there were more such "falls of water" beyond. Just above the rapids another river entered the main stream. According to the savages this was the best route to the kingdom of Saguenay, whose inhabitants were clothed like the French and had great stores of gold and other precious metals.

Cartier made his way back to his vessels on the Saint Charles and in the course of the winter, during which part of his crew was carried off by scurvy, sought to obtain as much information as possible about this northern Mex-

ico called by the savages the "kingdom of Saguenay." That King Francis might have as much information as possible on this subject Cartier, on the day he had a large cross erected to mark the French possession of this region, ordered his men to seize the chief of this village and eleven others whom he placed on board his vessels as prisoners. Leaving the Saint Charles with only two of his vessels on Saturday, 6 May, he passed down the south shore of the Saint Lawrence and through the passage to the south of Anticosti Island, which on his first voyage he had mistaken for a bay. From Chaleur Bay he steered for Brion Island and discovered after leaving it that the coast to the south was not the main shore but a group of islands. Heading still to the east he reached Cape Breton Island and found his conjecture as to the existence of a strait here to be correct. After touching at the islands of Saint Pierre and Miquelon he left one of his long-boats in a small harbor 10 miles north of Cape Race and then on Monday, 9 June, set sail for home. They reached St. Malo in safety on Sunday, 16 July.

Owing to the wars in which France was then engaged, nothing further was done until the winter of 1540-41, when an expedition was organized to proceed to the conquest of this rich kingdom of Saguenay. While Cartier was to act as pilot, the command of the land forces was given to a Picard nobleman named Roberval, who had distinguished himself in the recent wars. Through a delay about the artillery, the latter was not able to be ready in time, so Cartier set sail from Saint Malo alone with five vessels on Monday, 23 May. They had a bad passage out and having waited some time in Newfoundland for Roberval did not reach the island of Orleans until the end of August. Cartier took up his quarters this time at the river of Cap-Rouge, nine miles above Quebec. A week later he sent back two of his vessels to France "with letters unto the king, and to advertise him what had been done and found: and how Monsieur de Roberval was not yet come, and that hee feared that by occasion of contrary winds and tempests he was driven backe againe into France." Five days later Cartier set off in two long-boats to re-examine the rapids of Hochelaga and find out what arrangements should be made for passing them in the spring with the troops. He was informed by the Indians living alongside the rapids that after passing this one there were several others of the same sort before the Saguenay could be reached. With this information to help him Cartier returned to Cap-Rouge, where he spent the winter. Neither in that autumn nor in the spring of 1542 was anything heard of Roberval. The latter did not set sail from France until the middle of April 1542 and was unable to reach Newfoundland until the first week in June. When at anchor there in the harbor of Saint John's he was much surprised one morning to see Cartier arrive. According to Cartier's account "hee could not with his small company withstand the Savages, which went about dayly to annoy him." On being commanded, however, by Roberval to return "he and his company, mooved as it seemeth with ambition, because they would have all the glory of the discoverie of those partes themselves, stole privily away the next night and departed home for Brittany." Roberval was

CANADA — THE ERA OF EARLY DISCOVERY

thus obliged toward the end of June to make his way up the Saint Lawrence alone. He took up his quarters in the buildings at Cap-Rouge which Cartier had vacated. On 14 September he sent back to France two ships "to carie newes unto the king and to come backe againe the yeere next ensuing furnished with victuals and other things." During the course of the winter 50 of his people were carried off by scurvy, so that when he set off early in June 1543 to conquer the kingdom of Saguenay he had only 8 boats and 40 men. The remainder who only numbered 30 were left in charge of the fort. How far up the Saint Lawrence Roberval penetrated we do not know; for no further account of his movements has come down to us. It seems probable, however, that after penetrating a short distance up the Ottawa and finding no trace of gold he returned to Cap-Rouge where he found Cartier, who had been sent out to bring him home. In the course of the autumn the rest of the men returned. On the failure of this expedition becoming generally known a new proverb was coined. When any object in appearance of value was found to be worthless, it was called a "Canadian diamond."

The Rise of the Fur Trade, 1544-1612.—During the 10 years in which the French had been busy exploring the gulf and river Saint Lawrence and seeking to reach the mysterious kingdom of Saguenay, the number of vessels of various nationalities engaged in the fishing trade along the Atlantic seaboard had been steadily increasing. On his arrival at Saint John's, Newfoundland, on 8 June 1542, Roberval had found "seventeene shippes of fishers," which were six more than Rut had met there in August 1527. Out of this annual fishing trade, which was carried on along the coast from Belle Isle as far south as Cape Cod, gradually grew the fur trade. The fishermen, when riding at anchor in a bay or inlet, found that the savages of the neighborhood were always ready to part with their furs for a mere trifle. Since these furs sold in Europe for a high price, the practice grew up among the fishermen of bringing out each year a supply of trinkets on purpose to barter for furs. The returns were so good that in process of time some vessels made a specialty of the fur trade. Thus in 1569 we hear of a French vessel from Havre that "had a trade with the people of divers sortes of fine fures." In 1581 some Saint Malo merchants sent a small barque of 30 tons into the upper Saint Lawrence, and so successful did the voyage prove that in the following year they despatched a ship of 80 tons. In 1583, in which year the merchants of Saint Malo sent three vessels to the Saint Lawrence, Stephen Bellinger of Rouen "brought home a kynde of muske called castor; divers beastes skynnes, as bevers, otters, martenes, lucernes, seales, buffs, dere skynnes, all dressed and painted on the inner-side with divers excellent colours." In the following year the merchants of Saint Malo brought back with them two savages in order that they should learn French and afterward facilitate more extended trading relations. The result was that in 1585 they sent 10 ships into the Saint Lawrence. In January 1588 two of Cartier's descendants obtained a monopoly of this fur trade, but so great was the outcry raised by the other excluded merchants that in May the monopoly was revoked. The trade continued to remain open like the

fishing trade until 1599. In addition to cod, some of the vessels fished for furs, and toward the close of the century there was a great development of the walrus-fishing. In the spring of 1591 the Bonaventure of Saint Malo made her way to the Magdalen Islands in the Gulf of Saint Lawrence, where she "slewe and killed to the number of fifteene hundred morses or Sea-oxen," as the walruses were then called. With the 40 tons of train-oil into which these were boiled down she reached the mouth of the English Channel in safety, but was there captured by an English vessel from Bristol. Relying on the information thus obtained, a vessel was sent thither from Falmouth in 1593, and though she "tooke certaine Sea-oxen," it was "nothing such numbers as they might have had, if they had come in due season," for they arrived late in the summer. In the spring of 1594 the Grace of Bristol set sail to Anticosti, "being informed that the Whales which are deadly wounded in the grand Bay (the Gulf of Saint Lawrence), and yet escape the fisher for a time, are wont usually to shoot themselves on shore there." Finding no whales she made her way back to the bay of Placentia in Newfoundland, where she met "fishermen of Saint John de Luz and of Sibiburo [Cibouret] and of Biskay to the number of threescore and odde sayles." After fishing there for some time she made her way to Ferryland on the east coast, where lay "two and twentie sayles of Englishmen." In that port she "made up her fishing voyage" and set sail for home. In the summer of 1597 the Hopewell of London, of 120 tons, was driven away from the Magdalens by two ships of Saint Malo and two others of Cibouret, which united their forces against her. Meeting with a similar hostile welcome from five French ships in a harbor of Cape Breton Island, she repaired to the port of Sainte Marie in Newfoundland, where she found a vessel from La Rochelle and another from Belle-Isle-en-Terre at the mouth of the Loire. Since this latter hailed from a Catholic part of France it was decided to capture her. "We first," says the account, "sent our boat aboard the Rocheller to certifie him that we were his friends and to request him not to hinder our fight with the enemy. This message being sent, we made all the haste we could unto the ship of Belle Isle, which first began with us with three great shot, one whereof hit our maintopsaile, but both the other missed us. And we also sent one unto them; then being approached nere unto them ten or twelve of us went in a shallop to enter them. And when we boorded them in our boat, they betooke themselves to their close fights, playing chiefly upon us with shot and pikes out at two ports, between which we entred very dangerously, escaping meere dangers both by shot and pike. Some of our men were wounded, but no great harme was done." With this prize the Hopewell returned to England. In the following year an unsuccessful attempt was made to establish a colony on Sable Island. The Marquis de la Roche (q.v.) had obtained his first letters patent authorizing him to occupy land in the region of Newfoundland in 1577, and in 1578 he had set sail thither with two vessels. The "pinnace," however, had been obliged to return through "fowell weather," and, though the larger vessel, after being "well beaten by four English ships which this French ship had thought to have robbed," had "taken her course

CANADA—THE ERA OF EARLY DISCOVERY

for Newfoundland," we do not know what was done there. It is probable, however, that La Roche merely selected a spot for settlement, since it was not until 1584 that the colonists were embarked. Unfortunately "his greatest ship of 300 tons was cast away over against Brouage" on the west coast of France, and so the expedition came to naught. From 1589 to 1596 La Roche was kept a prisoner by the Duc de Mercœur, but on his release he made a fresh attempt to establish a colony. In the summer of 1598 he landed on Sable Island 60 "sturdy male and female beggars," taken from the prisons of Normandy. On returning thither from the mainland he was blown all the way back to France. No fresh attempt was made to continue his colony, and when the remnant was succored by a fishing vessel in 1603, only 11 persons were still alive. On this failure of La Roche's colony, no sign was left that France claimed the region of the Saint Lawrence as her own. To remedy this state of affairs a monopoly of the fur trade for 10 years was granted in the spring of 1599 to a fur trader of Honfleur, who yearly sent out four vessels to the Saint Lawrence. The condition was that he should people the country each year with 50 colonists. In fulfilment of this agreement, on the conclusion of his annual barter with the Montagnais at Tadoussac in the summer of 1599, he left behind 16 men huddled together for warmth in a small log hut at the mouth of the Saguenay. On the return of the vessels in the following summer, no fresh colonists were landed and only five of the former batch were found alive. These had only saved themselves from perishing by taking refuge among the neighboring Indians. In the meantime the remaining traders, who were well aware that the few colonists taken out were only to throw dust in the eyes of the government, loudly complained against their exclusion from the fur trade. To quiet matters, a commission was appointed in the winter of 1602-3, which recommended the admission of certain Rouen and Saint Malo traders on condition they should bear their share of the cost of colonization. Before, however, more colonists were sent out it was deemed advisable to explore the country in detail in order that the best site available might be chosen for the settlement. This survey was carried out in the summer of 1603 by Samuel de Champlain, an officer of the navy, and Dupont-Gravé, one of the fur traders. The result was that in the spring of 1604 a fresh monopoly for 10 years was given to a company formed by the Sieur de Monts (q.v.) on condition that 60 colonists a year should be taken out. The first settlement was formed in the summer of 1604 on the island of Sainte Croix, in the Bay of Fundy. "The Fort hee [De Monts] seated at the end of the Iland, opposite to the place where he had lodged his Canon, which was wisely considered to the end to command the river up and down. And out of the same Fort was the Switzers lodging, great and large, and other small lodgings, representing as it were a suburb. Some had housed themselves on the firme lande neere the brook. But within the Fort was Monsieur de Monts his lodging made with very faire and artificiall Carpentrie worke, with the Banner of France upon the same. At another part was the store-house wherein consisted the safety and life of everie one, likewise made with faire Carpentry worke and covered with reedes.

Right over against the said store-house were the lodgings and houses of these Gentlemen, Monsieur D'Orville, Monsieur Champlain, Monsieur Champdoré and other men of reckoning. Opposite to Monsieur de Monts, his said lodging, there was a galerie covered for to exercise themselves either in play or for the workmen in time of raine. And betwene the said Fort and the Platforme, where lay the Canon, all was full of gardens whereunto everie one exercised himselfe willingly." The winter of 1604-5 proved so severe on the exposed island of Sainte Croix, the soil of which turned out to be extremely sandy, that in the following summer the settlement was transported across the Bay of Fundy to the harbor of Port Royal (now Annapolis Basin), where the buildings were put together in the form of a large square. The winter of 1605-6 again proved a hard one, however, and, owing to the late arrival of the company's vessel, not only were all the furs taken by interlopers, but the colonists themselves finally embarked in two small boats in order to find a fishing vessel willing to take them back to France. They fortunately met their own vessel, in which they returned to Port Royal. In the spring of 1607, however, the company's monopoly, which had legally seven years more to run, was suddenly repealed through the intrigues of the Hatters' Corporation of Paris. Nothing remained but to send out a vessel to bring home the colonists at Port Royal, which was done.

On Champlain's recommendation De Monts now turned his attention to the Saint Lawrence. In order that he might retrieve a part, at least, of his losses King Henry IV. allowed him a monopoly of the fur trade there for one year. In the summer of 1608, accordingly, Champlain repaired to that part of the river called Quebec, or "the Narrows," where he constructed a trading-post. It was hoped that this would not only give them an advantage over the other competitors in the years of open trade, but would also hold the warlike nation of the Iroquois in check and allow the Algonquins, who came down every summer with furs from the upper Ottawa, to go backward and forward on the Saint Lawrence in all security. When Henry IV. heard of the construction of De Mont's post at Quebec he renewed his monopoly for another year. Taking advantage of this, Champlain, in the summer of 1609, accompanied the Montagnais and the Algonquins on the warpath against the Iroquois. In order to see the palefaces of which they had heard so much, and also to have their share of the victory over the Iroquois, the Hurons, who dwelt beyond the Algonquins on the shores of Georgian Bay, came down to Quebec, for the first time, in the summer of 1609. This combined expedition surprised a combined force of 200 Iroquois on Lake Champlain. At the sight of the French and the report of their fire-arms the enemy broke and fled. The Hurons were delighted, and promised to come down henceforward every summer to the annual barter. In this same year (1609) the Sieur de Poutrincourt (see *POUTRINCOURT*, JEAN DE BIENCOURT) established himself with his family in the buildings formerly occupied by De Monts' colony at Port Royal. He continued to reside here until his home was burned by the English in 1613. Although during the winter of 1609-10 De Monts sought to have his monopoly renewed, or at any rate the trade reserved to him, in the

CANADA—THE ERA OF EARLY DISCOVERY

region explored by Champlain in his expedition against the Iroquois, all was to no purpose. In the summer of 1610 the fur trade was thrown open to the merchant marine of France to the same extent as the cod, whale, and walrus fishing. The result was that so many traders resorted to the Saint Lawrence in that summer that there was a plethora of goods and many ships found it impossible to get rid of even a portion of their cargoes. There was a similar inroad in the summer of 1611. The results of this competition were soon apparent among the savages. Not only did they ask more for their furs, but they also began to have a poor opinion of the palefaces, whom they saw even strip blood-stained furs off the corpses of dead Indians. De Monts also felt it to be unjust that he should be put to the expense of keeping up the post at Quebec when no advantages were accorded him in return. During the summer of 1612 Champlain was kept in France by a fall from a horse, and he improved the opportunity by seeking to bring about a better order of things in the Saint Lawrence. Through his efforts the system of open trade was brought to an end in the autumn of 1612.

The First Permanent Colonization, 1613-32.—In order that the licentiousness of a few merchants should not spoil the trade in the upper Saint Lawrence and ruin the prospects of exploring, with the help of these Indians, the regions farther to the west, Champlain induced the king's uncle, the Comte de Soissons, to apply in the autumn of 1612 for a monopoly of the fur trade above Quebec. This was granted on condition that, during the 12 years it lasted, six families a year should be taken out by the company. Although Soissons died a few weeks later, the monopoly was transferred, at Champlain's request, to Soissons's nephew, the young Prince de Condé. As no time was left to form the company before the trading season opened, Condé merely issued licenses to seven merchants to barter above Quebec. They were each to place four men at Champlain's disposal in case he had need of them. On account, however, of the licentiousness of some of the traders in the previous summer when Champlain was absent, neither the Algonquins nor the Hurons put in an appearance in 1613 at the rapids. At this Champlain set off up the Ottawa with a few attendants, and by his exertions induced over 80 canoes to come down to the barter. In the same summer of 1613 an English vessel from Virginia destroyed De Poutrincourt's home at Port Royal, and also captured a French vessel sent out by the Jesuits to form a colony at Mount Desert, on the New England coast. In the summer of 1614 Champlain completed the formation of the new company for trade in the Saint Lawrence. On the failure of the La Rochelle merchants to appear, the whole of the shares were divided among the traders of Rouen and Saint Malo. On reaching the annual barter at the Lachine Rapids in the spring of 1615, Champlain found that his absence in the previous summer had made the Indians doubt his friendship. In order to regain their confidence, and also explore the regions farther to the west, he set out with the Hurons on their return. He was thus able during the winter of 1615-16 to learn much of the geography of the present western Ontario as well as the region about Lake Ontario, to the southern shore of which he

accompanied a war expedition against the Iroquois. So grateful were the Hurons for the help thus accorded them that they accompanied Champlain in great numbers on his return to the Saint Lawrence in the spring of 1616. For this reason, also, the barter of 1617 and 1618 were extremely well attended. Notwithstanding this increase of trade, the company unfortunately did nothing toward establishing a local source of supply, and paid almost no attention to colonization. Only one family was brought out, and it was treated in an extremely unjust manner. Not only were none of its members allowed to engage in the fur trade, but while paying very high prices for all the stores bought from the company they were obliged to sell their own produce at the very low prices current in France. When Champlain, as the representative of the viceroy, sought to secure the fulfilment of these conditions as to colonists, defense and local sources of supply, he simply made himself disliked. In the spring of 1619 they even refused him a passage to Quebec. At the king's express command he returned there in 1620, only to find the factory so tumble-down that the rain came in on every side. When this was notified to the admiral of France, who had succeeded Condé as viceroy, he at once revoked the monopoly of the company and gave the trade to two Huguenot merchants, William and Emery de Caën. The old company, however, appealed to the king. Pending his decision both parties sent out vessels in the summer of 1621 and each left servants of its own to winter at the factory. In the course of the winter of 1621-2 the two companies amalgamated with a fresh monopoly which was to run until the year 1635. Unfortunately this united company neglected colonization and local sources of supply as much as its predecessor. The result was that in the spring of 1623 when the vessels arrived late they found that for some months all the inmates of the factory had been living on roots and berries. The same state of affairs re-occurred a few years later. Champlain, who was still governor, did his best to keep this united company up to its engagements, but whenever he returned to France everything was allowed to go to ruin. Although on his departure in the autumn of 1624 he left the new factory almost completed, he found on his return two years later that not a single nail had been driven in since he went away. "It could have been finished," said Champlain, "in a fortnight, had they been willing to work, but that is just what they will not do." As little attention was paid to cultivating a local source of supply, and when, in the summer of 1627, the principal supply-ship failed to appear, the outlook for the winter was far from bright. To make matters worse, war broke out between England and France in the spring of 1628 and several English ships were sent into the Saint Lawrence. Although Champlain bravely refused to surrender the factory, the fleet sent out to Quebec by a new company which Richelieu had formed was captured below Tadoussac. At the same time a Scottish colony was founded at De Poutrincourt's old quarters at Port Royal. In the winter of 1628-9 these Scottish and English merchants formed themselves into one company and sent out two fleets in the spring of 1629. While one brought fresh stores to Port Royal, the other entered the

CANADA — UNDER FRENCH RULE

Saint Lawrence and summoned the factory at Quebec to surrender. As no help of any sort had come since 1627 and all the inmates had been living for some time on roots and berries, Champlain was obliged to comply. On 22 July 1629 the English flag was run up on the flag-staff. The new company formed by Richelieu, called the Company of New France, also sent out a fleet, however, which not only succored the small French post at Cape Sable, below Port Royal, but also succeeded in dislodging Lord Ochiltree, who had formed a settlement on Cape Breton Island. He and his people were taken prisoners, and out of the material of their buildings a new French fort was constructed in one of the neighboring harbors. Here a garrison of 40 men was left. In the autumn of 1629 the French applied for the restitution of Quebec, since it had been surrendered after the conclusion of peace on 29 April. King Charles I. acquiesced, but the negotiations dragged on until the spring of 1632. In the meanwhile both companies sent out provisions to their posts; the Company of New France to Cape Sable and Cape Breton Island, and the English and Scottish company to Port Royal and Quebec. Finally, on the conclusion of the Treaty of Saint Germain-en-Laye on 20 March 1632, the post at Port Royal was made over to the Company of New France, while the old United Company was allowed to enjoy the trade at Quebec for one year in order to recuperate itself for its heavy losses. In the summer of 1633 its servants retired and the whole of New France passed into the hands of the Company of New France, which held it until the year 1664. See also EXPLORATION IN AMERICA.

H. P. BIGGAR,
Author of 'The Early Trading Companies of New France.'

Canada — Under French Rule (1632-1755). When the Treaty of St. Germain-en-Laye (1632) restored to France (see FRANCE — *History*), her possessions in North America, Acadia and Canada were still savage wastes. Prior to this date Port Royal and Quebec had hardly advanced beyond the status of convenient landing points, while Tadoussac and Three Rivers were mere rendezvous for barter. In theory the profits of the fur-trade were enormous, but disaster or disappointment seemed to follow each venture with dismal regularity. At the same time the attempt to establish permanent colonies had been attended by only a moderate degree of success. Louis Hébert and a few other settlers had maintained themselves at Quebec for twenty-one years before the surrender of that place to the English, but their privations were constant and severe. Those who supported themselves by agriculture were less than a score and the total population barely passed one hundred. As for the missionary efforts which constituted a third form of French activity in Canada, neither Jesuits nor Récollets had gained more than a handful of converts and a certain amount of friction between the two orders already existed. One hopeful sign was indeed visible; for in 1627 the Company of New France took form with Richelieu (q.v.) and other prominent people at its head, but this organization (better known as the Company of the Hundred Associates) was just beginning to show signs of vitality when Quebec fell (1629)

into the hands of Kirke (see KIRKE, SIR DAVIS). The general state of the situation can be described in a single phrase. Though individuals had displayed great enterprise and splendid heroism, the French as a nation had not impressed themselves deeply upon the western hemisphere.

Between the Treaty of St. Germain-en-Laye and Wolfe's decisive victory over Montcalm (1759) (see COLONIAL WARS IN AMERICA), lies a period of one hundred and twenty-seven years which is marked by all the features of genuine colonization. It cannot be said that in wealth and population New France kept pace with the English colonies from Massachusetts to Georgia; but while the economic basis of the French was less solid their geographical range was wider and their institutions were equally distinctive. For a century and a quarter France continued to be an active competitor for the control of this continent and maintained a strong foothold upon it. Moreover the Canadian French, the *habitants*, developed feelings of local pride and patriotism which, though they did not beget political restlessness, are not less noticeable to the historian than are the pride and patriotism of the English in America. From 1632 to 1759 New France was a colony peopled by vigorous and resourceful inhabitants. Unfortunately it possessed a defective system of administration, but its annals are adorned by noble deeds and its life represents a characteristic form of civilization.

Of the two regions which France regained in 1632, Canada was destined to be the more important and to be held upon the firmer tenure. Acadia with its long frontier of seaboard lay open to easy attack from the side of New England and after 1621, when James I. gave Sir William Alexander the charter of Nova Scotia, (see NOVA SCOTIA — *History*) its population contained a Scottish element. At the moment when Port Royal fell to the English for the second time (1628) the ablest and most loyal Frenchman in Acadia was Charles de la Tour, but on the formal restoration of the colony four years later Isaac de Razilly, a relative of Richelieu, was appointed royal lieutenant. During his lifetime the French in Acadia proved able to hold their own against New England and even to destroy posts which the English had established on the coast of Maine. De Razilly's death, however, precipitated an acute quarrel between de la Tour and the able, unscrupulous Charnisay who had come to the colony with de Razilly in 1632. The prosecution of the feud between these rivals led, among other things, to a famous siege of Fort Saint John by Charnisay and a spirited but fruitless defense of the stronghold by Mme. de la Tour in her husband's absence. The long and bitter broil ended peacefully enough in the marriage of de la Tour and Mme. Charnisay after the death of Charnisay and Mme. de la Tour, but meanwhile the prosperity of Acadia had been seriously hampered by a domestic feud which unsettled the whole administrative system and raised the issue of Catholic versus Huguenot. In 1654 Acadia was seized by the English for the third time and held till 1667 when France regained it by the Treaty of Breda (see BREDa, *TREATY OF*). During the greater part of the next twenty years peace between the two nations prevailed along the Atlantic coast, broken by occasional

CANADA — UNDER FRENCH RULE

bickerings at points near a frontier which was always in dispute: but with the renewal of hostilities in the reign of William III. Acadia suffered severely and had not repaired her losses when the war of the Spanish Succession (see SUCCESSION WARS) broke out. This time the contest for supremacy reached a final settlement in one part at least of the New World. Nicholson's occupation of Port Royal (which he rechristened Annapolis, 1709) together with Marlborough's victories in Europe combined to secure Acadia to England by the Peace of Utrecht (1713). (See UTRECHT, PEACE OF). But even then the triumph of the English was not complete, for the island of Cape Breton still remained in the hands of France and the guns of Louisbourg, guarding the entry to the Gulf of St. Lawrence, declared more plainly than words that the Atlantic seaboard would not be surrendered to England without a further struggle. In marked contrast to their precarious hold upon Acadia, the French built up along the shores of the Saint Lawrence a colony which, whatever its shortcomings, did not change hands with every generation. Canada was far from invulnerable, as the capture of Quebec by Kirke had already proved and as its siege by Phips (see PHIPS, SIR WILLIAM), was to prove once more in 1690; but long stretches of wilderness separated it from the English settlements, while the navigation of the river presented grave dangers to a hostile fleet. The fate of Sir Hovenden Walker, whose powerful fleet was shattered among the shoals of the Egg Islands (1710), shows that sea power could not be brought to bear against Canada so readily as against Acadia, and the fierce raids of Frontenac illustrate with equal force the ability of the French to defend themselves by land. French rule in Canada lasted long enough and was sufficiently secure to furnish a great object lesson in colonial method.

Apart from military history and the pathos which belongs to the loss of an empire, the life of New France is more interesting in the 17th than in the 18th century. The two generations that elapse between the return of Champlain (q.v.) and the death of Frontenac (q.v.) (1633-1698) are marked by a series of striking exploits and the establishment of fixed institutions. Energy and enthusiasm abound; the explorer and the missionary are lavishing their lives on causes which mean infinitely more to them than any form of personal ambition; the colonist is becoming a native, a *habitant*, whose concerns are increasingly associated with America; problems of Church and State are arising to vex the souls of governors and quicken the zeal of prelates. On every side there are signs of that fresh vigor which derives its impulse from the novelty and charm of the wilderness. In dealing with the progress of Canada during the middle and latter part of the 17th century, it is necessary to distinguish between the regions which were claimed by right of discovery and those which were effectively occupied by settlement. Before Frontenac's death lands had been cleared and rendered fit for cultivation at a good many points between Tadousac, where the Saguenay enters the Saint Lawrence, and Montreal. Above Lake Saint Louis there were forts at important strategic points like Kingston (then Fort Frontenac) and Detroit, but for agricultural purposes the colonial zone stopped at the

Lake of Two Mountains, an expansion of the Ottawa. Beyond the island of Montreal lay the *pays d'en haut*, a vast territory which was repeatedly traversed by the pioneers, whether adventurers, traders, or missionaries, but which remained almost destitute of settlers. From the Saint Lawrence the French were led inevitably to the Great Lakes and thence by an easy passage to the Mississippi. Thus their explorations belong no less to the history of Illinois, Michigan and Wisconsin than to that of Canada. In the Laurentian valley the river was another Nile with a further element added, since besides being the great local thoroughfare it was a highway that opened the route to the Mother Country. If, unlike the Nile, its waters could not be made to produce a rice crop they abounded in the fish which were so necessary to the food of a Catholic community. The form of land allotment sprang from the one cardinal condition of life on the banks of a central stream. Each peasant had his strip of water frontage, however narrow, and was able at a moment's notice to embark in his own bateau or canoe. The only towns of Canada were Quebec, Three Rivers and Montreal, all situated on the Saint Lawrence, and no permanent settlements were made in any part of the country unless within easy reach of it or its tributaries. The north shore, owing to its rugged character, was less suited to farming than the south, and in the valley of the Richelieu, the outlet of Lake Champlain, many of the best seigneuries sprang up. The settlement of the Richelieu valley was also intended to provide a bulwark against the Iroquois. (See SIX NATIONS, THE.)

Closely connected with the distinction which has just been made between the Laurentian valley and the back or upper country (*pays d'en haut*) is the contrast between peasant and woodsman. According to the system of land tenure that prevailed in Canada under the Old Régime rural society was divided between the *seigneurs* or landlords and the *censitaires* or tenants. In Canada, as in France, gentility and the possession of an estate went together, but there is this important difference between the feudalism of the mother country and the colony, that whereas in France the peasants bore appreciable burdens during the 17th century, in Canada no *censitaire* could be seriously crippled by the taxes or services to which he was bound. Feudalism, an institution of the 9th century could not be transplanted without change to the New World in the age of Louis XIV. The French of Normandy and Brittany made admirable colonists, when once they had been induced to embark; but some prospect of improved conditions must be held out before emigrants would come forward. Moreover in a country of virgin forest it was impossible that peasants should be taxed as their kindred were in a land of ancient cultivation. In view of these considerations the *habitants* received their farms on very reasonable terms. How moderate were the demands of the *seigneur* may be seen from a single instance. A deed of 19 June 1694, concedes a lot of land three arpents in front by forty in depth (about a hundred acres) "in consideration of twenty sous and one good live capon for each arpent of front and one sou of *cens*, payable at the principal manor-house of the seigneurie on St. Martin's day in each year so long as the grantee shall occupy the land." The *habitant*

CANADA—UNDER FRENCH RULE

had in a certain sense the character of a woodsman, for a large part of his time was devoted to hewing down the forest, but he was not a woodsman in the fullest sense of the word. Besides the stationary peasant who cultivated his stump fields in the valley of the St. Lawrence, the population of New France embraced many restless and adventurous spirits who roved the woods, traded in beaver skins whenever they could elude the monopoly, intermarried with the Indians, and evaded the restraints of civilization without punishment from civil or ecclesiastical law. The *courcur de bois*, ("wood-runner") to give this type of colonist his generic name, was one of the most remarkable adventurers that this continent has ever seen. Though his vices were an object of scandal to the missionaries and his lawless habits an inconvenience to the government, he possessed the virtues of fearlessness and initiative to an exceptional degree. The comrades of Magellan and Drake were no more daring or resourceful than the *courcurs de bois* who pressed on from the valley of the Saint Lawrence into the wilds of the *pays d'en haut* and found amid the dangers of forest or prairie the fullest excitements of a nomadic life. Their names, for the most part, have perished; but legends like that of the *Chasse-galerie* bear witness to the hold they preserve upon the memory of French Canada.

In passing from these general statements regarding country and inhabitants, it is hard to say whether a place of greater prominence should be given to the government or to the Church. One should be careful not to represent the French Canadians of the 17th century as slaves—a tendency too current among English writers at the present day. The feudalism of New France was feudalism in its most mitigated form and the *habitant* winning a home for himself by courageous toil seems anything but a serf by instinct. Nevertheless French Canada was overshadowed by two institutions which visibly embodied authority as authority was not visibly embodied in New England or New York. Whether or not paternalism was the bane of Canada is an open question to be answered by the historical student in accordance with his own scheme of philosophy. The broad fact is that the Crown and the Clergy divided between them an extremely large part of the world in which the *habitant* lived. From 1632 to 1663 the affairs of Canada were controlled, under the Crown, by the Company of the Hundred Associates. Had this corporation been better managed, or rather had it been actuated by a larger spirit, it might have gained for itself a distinguished reputation and eventually handed over to the King a flourishing possession; but looking only to the greatest immediate return it wasted a fine opportunity and does not merit comparison with either the East India Company (see EAST INDIA COMPANIES) or the Hudson's Bay Company (q.v.). After 1663 executive power in Canada was deputed by the King to the Governor and the Intendant, with whom were associated the Bishop and a board of councillors varying in number from five to twelve. The Governor, who was always a noble, held the highest office in the colony though he did not possess so much real power as the Intendant. He commanded the forces, was the channel of diplomatic intercourse with the English and the Indians, occupied the central place in

colonial society and was authorized to follow his own judgment regarding matters of emergency. With finance, however, he had little or nothing to do, and from the whole field of civil administration he was excluded by the presence at his side of the Intendant. This official belonged ordinarily to the middle class and had been trained to law or business. The Crown seems to have acted on the maxim, "Divide and Rule." Both Governor and Intendant were required to send home detailed reports which always included a large amount of criticism and gossip. The Intendant passed judgment on the acts of the Governor and the Governor was not slow to express his opinion concerning the administration of the Intendant. Neither received untrammelled authority, for an autocratic king like Louis XIV. insisted upon reserving the use of his prerogative. The government of New France was less rigid and cumbrous than that of the Spanish possessions under Philip II., but the principle of absolutism carried out at such a distance from the court could not fail to impair the efficiency of administration.

The position of the Church in New France cannot be properly described unless a reference is made to the dominating influence which controlled Europe during the age of colonization. Seventeen years before Cartier's first voyage to the Saint Lawrence (1534) Luther had denounced the sale of indulgences at Wittenberg. In the interval between Cartier's first voyage and his last (1541) the "Institutes" of Calvin (see CALVIN, JOHN) was becoming the foundation of a church and the Company of Jesus (see JESUITS) was arising to stem the tide of heresy. Despite the wars of religion and the national exhaustion which they produced, religion was still the reigning issue in France when Champlain sailed westward to continue the work of Cartier. This may be seen chiefly in two ways; from the missionary zeal of the religious orders and from the anxiety of French Catholics that New France be kept untainted by Huguenot misbelief. With De Monts and Poutrincourt, Calvinism made its appearance at Port Royal and a little later it maintained itself for a while at Quebec under the protection of William and Emery de Caen, who did not carry out their promise to exclude heretics from the colony. But during the sway of Richelieu, the Huguenot cause perishes even more completely in Canada than in France, and a way is left clear for the unchecked ascendancy of Rome. No one can read the religious literature of New France without recognizing the sincerity of motive which brought Jesuits, Récollets, Sulpicians, Ursulines, to Quebec and Montreal. The savage races of America had excited the imagination of all Europe, and in France the desire was particularly strong to rescue these heathen from the doom of the unbaptized. The greatest nobles in the realm subscribed funds for the mission and acted as sponsors at the baptism of Micmac or Algonquin converts. First in importance among the religious orders of New France come the Jesuits, whose missionary tradition had been established more than half a century earlier by St. Francis Xavier. Entering Acadia and Canada with a record of brilliant success to give them confidence, they prosecuted their labors among all the nations from the Iroquois to the Illinois and from the Ottawas to the Natchez. Their most heroic deeds of self-sacrifice are

CANADA — UNDER FRENCH RULE

bound up with their mission to the Hurons (ending in 1649, when the power of the Hurons was destroyed by the Iroquois), and with their mission to the Iroquois covering the third quarter of the 17th century. It was always the aim of the Jesuits to turn the Indians from the nomadic life to the arts of civilization. In this attempt they were but partially successful. Although certain tribes of the Algonquin family yielded themselves willingly to the guidance of the missionaries, the total number of converts was far smaller in New France than in Paraguay. During the first generation after the restoration of Canada to France the Jesuits published in Paris an annual account of the labors undertaken by members of their order among the American Indians. These "Relations" (see *JESUIT RELATIONS AND ALLIED DOCUMENTS, THE*), are the best single source of information about the habits of the aborigines and also rank high in the list of our authorities for the history of Canada. Next to the Jesuits in order of prominence stand the Sulpicians, whose efforts centred chiefly in Montreal and the neighboring district. The founding of Ville-Marie de Montreal exemplifies in its purest form the mood of devotion that prompted Frenchmen to leave the civilization of Europe for a life of privation among the barbarous heathen of Canada. Here the colonizing impulse proceeded solely from a desire to spread the faith. With Olier and Dauversière, who founded the Society of Notre-Dame de Montreal, there was no thought of gaining wealth through the fur trade. The charter of the society expressly states that its members detach themselves from all regard to temporal interest and take for their one purpose the conversion of the natives. From 1642 to the close of the century Montreal was an outpost of civilization and Christianity, exposed to frightful dangers, as the exploit of Dollard (1660) and the Lachine Massacre (1689) testify, but defended by men who cared more for religion than for life. In the relations of the Church with the *habitants* friction seldom arose. There is reason to believe that the Jesuits incurred some unpopularity because they did not favor the appointment of *curés* in the outlying districts, but for the most part the attitude of the peasants towards the clergy was one of complete deference. Until 1665 when the Carignan Regiment came to Canada, the social order presented many features of a theocracy. Religion was supported by the state and derived a stronger support still from the energy of the religious. The prevalent mood was pietistic and public opinion sanctioned the ecclesiastical punishments which were called forth even by minor offenses against morals. Apart from church festivals the routine of daily life at Quebec or Montreal made little provision for relaxation or entertainment. Taverns were under the ban, dancing parties were unknown, and the general demeanor of sobriety would have met favor in the eyes of a New England Puritan. The coming of the Carignan Regiment broke in on this religious Arcadia and proved an entering wedge for frivolity, but in the early days the temper of New France was deeply religious, if not ascetic. One other aspect of ecclesiastical affairs deserves emphatic notice. While the clergy had to do with a docile population and were animated by pure enthusiasm in their work among the Indians, the religious life of the

colony was not free from friction. The Récollets, and after them the Sulpicians, felt that their interests were threatened by the enmity of the Jesuits. The Jesuits in turn prevented the Abbé de Queylus, an able Sulpician, from being made Bishop of Quebec, casting their influence in favor of Laval (see LAVAL-MONTMORENCY, FRANCIS XAVIER DE), who became the first titular bishop in New France. Laval, once appointed, quarreled with successive governors on different grounds — with Argenson (1661) on the question of precedence, and with Avaugour (1662) on the question of selling brandy to the Indians. The difficulty over precedence brought in the whole issue of Church and state; the quarrel over the brandy question was less lofty but more practical. The position of the Church was that brandy should not be sold to the savages under any circumstances. The general, though not the invariable, position of the government was that if the French did not sell brandy to the Indians the latter would buy rum from the Dutch and English. The Church as a whole and the *habitants* as a whole lived on excellent terms; but there was much friction between the religious orders, the *courcurs de bois* were a thorn in the side of the clergy, and a governor of secular tastes, like Frontenac, might keep up a running feud with the hierarchy for years.

The mention of Frontenac's name recalls a striking personality, for of all the governors who were sent out to New France during the long reign of Louis XIV. he must be called the ablest and most forcible. That his policy towards the Church was judicious or free from prejudice cannot be maintained, nor can it be forgotten that his memory is defaced by the stain of fearful massacres. But he was bold, resolute and thoroughly devoted to the interests of Canada. Throughout both periods of his rule (1672-1682; 1689-1698) he was master of the situation as none of his predecessors had been, and during the seven years of his absence from the colony the failures of La Barre and Denonville served to set off his virtues in the strongest light. The main political problems with which he had to deal were the enmity of the Iroquois, the aggressive policy of the English as suggested by Governor Dongan, and the extension of French influence from the Great Lakes into the valley of the Mississippi. Speaking broadly the Iroquois were the chief menace of Canada in the last part of the 17th century as the English were its chief menace in the first part of the 18th. The most celebrated of the Jesuit martyrs, Jogues and Brébeuf, met death at their hands; the most brilliant deed of courage which the annals of New France contain was Dollard's fight against them at the Long Saut; it was in their face that Madeleine de Verchères shut the door of her father's fort. Whether left to themselves or set on by the English they had every disposition to molest the French. The spirit of conciliation they mistook for weakness and, as Frontenac saw, the only way to impress them was by a show of strength. In 1696 he ravaged their country more thoroughly than De Tracy had done thirty years earlier, burned their palisades, destroyed their corn and convinced them that he had a power which they must respect. The next year their envoys came to Quebec speaking the language of humility. Frontenac's attack upon the

English dates from the beginning of his second term of office. Returning to the colony in 1689 he found that French prestige had vanished almost wholly during his absence. To impress the Indians and terrorize the English he equipped those raiding parties which carried the torch and the tomahawk to Schenectady, Salmon Falls and Casco Bay. As a *tour de force* of endurance, this winter campaign of the French was a remarkable feat, but the atrocities which accompanied it cannot fail to awaken the deepest abhorrence. Parkman finds, extenuation for Frontenac in the standards of his age. "He was no whit more ruthless than his times and his surroundings, and some of his contemporaries find fault with him for not allowing more Indian captives to be tortured. Many surpassed him in cruelty, none equalled him in capacity and vigor." Everything considered, this must be called a mitigated sentence, and apart from all considerations of humanity it may be doubted whether Frontenac's policy of carnage was a sound one. Its momentary success in impressing the Indians was not an equivalent for the spirit of vengeance which it awakened among the English. From 1690 forward, New France and New England have their rancorous enmities which continue to exist quite irrespective of peace or war between the mother countries. Phips may be turned back from Quebec but the memory of massacre endures until French power in Canada has been destroyed. A much brighter feature of Frontenac's régime is the progress made by French exploration in the Far West. While the famous journey of Marquette (q.v.) and Joliet (q.v.) down the upper waters of the Mississippi (1673) may be more fitly connected with the names of Courcelle (q.v.), Frontenac's predecessor, and of Talon (q.v.), the good Intendant, the picturesque exploits of La Salle (q.v.) and Tonty (q.v.) fall within the period of Frontenac. It was by favor of Frontenac that the fort at Cataracou (now Kingston) was placed in La Salle's hands, thus enabling him to establish a fixed base at the east end of Lake Ontario for his operations on the Great Lakes and beyond. As far as the Huron country the French had been on familiar ground ever since the days of Champlain, but their chief triumphs in opening up the *Hinterland* were won under Frontenac.

The 18th century opened for New France with bright prospects which were destined never to be realized. The war that closed at the Peace of Ryswick (1697) had just demonstrated the defensive strength of Canada, and though D'Iberville's (see IBERVILLE, SIEUR D') conquests in Hudson's Bay were restored to England, France did not lose Acadia. Frontenac's chastisement of the Iroquois had brought relief from an ancient scourge and Callières' diplomacy concluded the peace which had been made possible by a decided blow. The War of the Spanish Succession closed less favorably. The success of Vaudreuil's raids was a poor equivalent for Marlborough's victories or even for Nicholson's capture of Port Royal. France lost Acadia and was thrown back for her hope of an Atlantic dominion upon the single fortress of Louisburg (q.v.). The Peace of Utrecht (1713) may be called the beginning of the end.

The history of Louisburg is a tale of great effort, enormous expense and complete disappointment. France lavished upon this harbor

in Cape Breton as much money as it would have cost to erect a fortress of the first class in Europe. Until 1745 its strength remained untested, but the French themselves thought it impregnable and the English looked upon it with dread. The political effect of Louisburg was two-fold. Its near neighborhood to Acadia prevented the French of that province from becoming loyal to British rule, and in New England it was regarded as a permanent menace to peace. When the War of the Austrian Succession offered an excuse, Massachusetts was ready for the attack. Governor Shirley (see SHIRLEY, WILLIAM) devised the plan, which was daringly executed by a colonial fleet under William Pepperell (q.v.) in co-operation with four British men of war. The capture of Louisburg by a militia force was the greatest humiliation which France had suffered in America and its restoration by the Peace of Aix-la-Chapelle (1748) (see AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT), came to New England as the sorest affront which it had ever received at the hands of the home government.

At the Peace of Utrecht New France contained a population of rather more than 25,000. In 1763 when Canada was ceded to England the number of inhabitants had advanced to about 60,000. It is obvious that this rate of increase was trivial in comparison with the progress of the English colonies during the same period, and when we remember the unusual fecundity of the French Canadians, some special reason needs to be assigned for the slow development of the colony. The cause of this striking phenomenon will be found in the fact that immigration was not spontaneous, as in the case of the English colonies, but controlled by government. Partly owing to the institutions which prevailed in France during the 17th and 18th centuries, and partly owing to gross mismanagement of colonial affairs by the court of Versailles, New France was handicapped in the long race with its southern rivals. This fact must be brought out because it is often erroneously stated that the Frenchman has never made a good colonist. The biography of Canada from Champlain to Montcalm gives the direct negative to such an idea. Maladministration, the lack of local self-government, and excess of loyalty to inherited institutions account for the defeat of the French in America rather than the want of promptness, courage, industry and resource. It must be remembered, moreover, that the English colonies took root in a soil which was better fitted to stimulate rapid growth. The long calm which followed the Peace of Utrecht (1713-1742) was often broken by signs of acute restlessness. As early as 1725 the Marquis de Beauharnois, who had become Governor in succession to Vaudreuil, was busy with schemes for keeping the English within the limits they already occupied. This meant that their expansion northwards should be checked in the vicinity of Lake George and their expansion westward by the range of the Alleghanies. Far from losing their love of exploration, the French pushed farther and farther westward with each decade Michilimackinac was to Verendrye what Cataracou had been to La Salle, and just at the moment when Maria Theresa was preparing to recover Silesia from Frederick the Great, one of Verendrye's sons caught a first glimpse of the Rocky Mountains. In America the hostility

CANADA — GREAT BRITAIN'S FIGHT WITH FRANCE

ties which accompanied the War of the Austrian Succession centred at Louisburg and accordingly this conflict affected Canada less than the two preceding wars had done. But every man of colonial origin, English and French alike, saw that the Peace of Aix-la-Chapelle was merely an armistice. Unsettled boundaries suggested endless friction, especially in Acadia and the Ohio Valley. The line which was run by Céloron de Bienville at the instance of France aimed at excluding the English from the Ohio and according to patriotic opinion in such colonies as New York, Pennsylvania and Virginia, amounted to a *casus belli*. Before the development of the western trade the English and French had been separated by a wide zone of wilderness. The expansion of both races brought them face to face at the junction of the Alleghany and the Monongahela. Should the stronghold built in this angle be called Fort Duquesne or Pittsburg? Here was an issue on which hinged the future of a continent. It was the misfortune of the French both at home and in Canada that their administrative system suffered from the worst evils of a corrupt absolutism. At Versailles the folly and extravagance of Louis XV., at Quebec the unblushing thefts of the Intendant Bigot, were but a poor preparation for war. And so the small but valiant race of the Canadian French bore the burden of vices not their own when they entered upon the last act of an irrepressible conflict. CHARLES W. COLBY,

Professor of History, McGill University.

Canada—Great Britain's Fight with France for North America—1753-1763. For several years previous to the formal declaration of war between England and France, in 1756 (see CANADA—UNDER FRENCH RULE), the stirring events in the Ohio Valley and in distant Acadia foreshadowed a great crisis, during which territorial disputes, aggressions, and political intrigues would be lost sight of for the moment, and the question paramount would be, the supremacy of France or of England in North America. The policy of France, as dictated from Versailles, had not been broad enough to successfully promote colonization, in the sense of expansion, or even to maintain permanent occupancy, although this was much desired. And the honest designs of her colonial administrator, La Galissonnière, to increase the dominion of his royal master, at an opportune moment, met with no responsive aid. The mother country was wedded to schemes of aggrandizement at home, and was inclined to leave her colony to work out its own future. Besides, the French then, as now, were rather a stay-at-home people. New France was consequently weak in population, and not in a position to retain her empire in the North, and, moreover, her influence was being undermined by official corruption. Great Britain, on the other hand, had the real advantage of superior numbers in the New World, although she had no definite colonial policy, and was already smarting from the effects of an earlier administration, due rather to ignorance than to knavery. The disputes touching possessions in Acadia were of long standing. By the twelfth article of the Treaty of Utrecht (see UTRICHT,

PEACE OF), Nova Scotia, within its ancient boundaries, had been ceded to the Crown of England. A controversy soon arose over the interpretation of a certain clause. Great Britain claimed that her possessions under the Treaty of Utrecht were of the same extent as those acquired by France under the Treaty of Breda; but France protested that the territory she then received was quite distinct from the ancient boundaries, which confined Nova Scotia to a portion of the southern peninsula. At the conclusion of the Treaty of Aix-la-Chapelle (see AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT), when Louisburg (q.v.) was restored to the French, the boundary questions were referred to commissioners, each Court agreeing that, until a decision was reached, no fort or settlement should be attempted upon the debatable ground. But the shrewd La Galissonnière, disregarding the stipulation, if he was ever officially acquainted with it, commenced the construction of forts, and favored settlement upon the lands claimed by England. The importance of Nova Scotia in the future development of Canada was apparent to each nation, both from a strategic and commercial point of view, but neither power could furnish from its colonial resources an army of sufficient strength to support its ambition. The policy of Great Britain toward Nova Scotia was most short-sighted. Instead of encouraging the emigration of a desirable class, intended to grow up with the Acadians and form a united and loyal people, she allowed the French, for nearly 40 years, to regard the country in the light of an exclusive settlement. It is true that they were good subjects; but they were French at heart, and it remained to be proved whether, under extraordinary pressure, their sympathies would incline to France or not. The possibility of such a contingency was for years practically ignored, but when it was seriously considered the methods adopted were ill-advised. The lands of the French were divided and sub-divided, until new grants were necessary; but Great Britain decreed that new lands could be acquired only by Protestants. The question of religion, therefore, became a condition of tenure. Shirley (see SHIRLEY, WILLIAM), the energetic governor of Massachusetts, who was largely responsible for the government of Nova Scotia, was firmly convinced that until French influence was exterminated British interests could not flourish; and so he endeavored to effect the conversion of the inhabitants, suggesting that rewards be given to those who renounced their faith. The king favored an assurance that the people should enjoy the exercise of their religion, but Shirley, in a proclamation, omitted the passage as dangerous. The home government then consented to a scheme for promoting the loyalty of the province by the importation of foreign Protestants, to mingle with the Acadians—a fusion possible under the British flag, but doubtful at such a critical moment, when the military organization was insufficient to protect the frontier, or to inspire confidence in the stability of British institutions. Government agents in Geneva, and elsewhere, were active in advertising in the papers for settlers, and bargaining with poor artisans. But the scheme fell through; though at last 3,000 good settlers were landed at Chignecto Bay in 1749, from which at length sprang

CANADA — GREAT BRITAIN'S FIGHT WITH FRANCE

the important naval post of Halifax (q.v.). In the meantime, however, a great struggle was impending, which led to the deportation of 8,000 Acadians (see CANADA — THE ACADIAN REFUGEES), whose subsequent misery and suffering contribute the darkest page to the history of Nova Scotia. A new oath of allegiance was demanded by Governor Cornwallis, which from time to time was deferred. While, on the other hand, the fiery zealot, Le Loutre (see LE LOUTRE, LOUIS JOSEPH), backed by the Indians, exercised every effort to retain influence over the people. Le Loutre detested the English, and was generally successful in persuading the unhappy people that an oath of allegiance to a Protestant monarch was very much like being disloyal to their faith, the penalties for which did not cease with their natural existence. But, although the dark deeds which were being enacted in 1753, concerning Nova Scotia, had a distinct bearing upon the approaching conflict, they were of secondary importance to the great mass of the British colonists, when compared with the prize which both French and English coveted — the possession of the Ohio Valley. The details of the contest in this section cannot be given here. See BRADDOCK, EDWARD; COLONIAL WARS IN AMERICA; FORT NECESSITY; PITTSBURGH, *History*; WASHINGTON, GEORGE. The effect of Braddock's defeat was felt in the expeditions of Shirley against Oswego (q.v.), and in that of Johnson against Crown Point (see CROWN POINT, *Fortress of*). A body of provincials had been raised, and placed under the command of Johnson for the reduction of Crown Point. But Dieskau intercepted, and almost captured, a detachment of this expedition. Reinforcements arrived at a critical moment, and the tables were turned by the capture of Dieskau. This circumstance was made a great deal of, but, nevertheless, Crown Point was unmolested, and still in the hands of the French. War and bloodshed had desolated the homes of the colonists and destroyed their commerce, and over all of them hung the dread of the tomahawk and the scalping knife of the Indian. Panic-stricken, they could devise no means of defense, and surrender seemed preferable to fight. In Acadia, while the two nations were still at peace, the determination of the British had driven into exile the unhappy Acadians. But their own position there was by no means to be envied. British prestige was indeed at a low ebb in America, when the struggle between the colonists was superseded by a contest between the two powers, which commenced officially when King George II. signed the declaration of war against France in May 1756.

The situation in New France was indeed acute. Agriculture had been neglected, grain was scarce, horses were slaughtered for food, famine was imminent. But it should be borne in mind that this deplorable state of affairs was not the inevitable outcome of the struggles through which the country had passed, but a condition actually created for profit, toiled for and plotted for by Bigot, in order that he might appear as the real savior of the distressed colony. The advice of the Intendant to his somewhat weak-kneed, and certainly dishonest, henchman, Vergor, to "cut and slip, and make hay while the sun shone, in order that he might have the means to build a château

in France," was but an indication of the course he intended to follow himself, though on a grander and more colossal scale. New France was to be pillaged. The people must be subdued, and bodily suffering would prove effective where less persuasive methods might fail. New life was given to the colony for a moment when the Marquis de Montcalm (q.v.) arrived in Canada in the spring of 1756, with 1,200 troops and ample supplies. No better general could have been chosen than Montcalm. In fact, men of his mold were just what New France needed most at this time. He was an excellent soldier and had already won renown. He was loyal to his sovereign, at a time when loyalty was not profitable; he was brave and courteous, and he dearly loved France. Vaudreuil (see VAUDREUIL-CAVAGNAN, MARQUIS DE), the governor, was a Canadian, and attached to the land of his birth, but he despised every form of interference from France. Hence there was constant friction. Bigot, the representative of the king, loved his master and the colony only in proportion to the measure in which they contributed to his needs; and his needs were of abnormal proportions. The conduct of Montcalm throughout the war, until the supreme hour when he yielded up his life in defense of the colony, forms a striking and pleasing contrast to the actions of his two colleagues. He was also fortunate in the chief officers under him.

England was far less happy than France in the choice of the commander-in-chief of her forces. Lord Loudon, who was placed at the head of the 900 regulars sent out to the colonies, was no match for the brilliant Montcalm. Arriving in Albany two months after he was expected by his chief officers, Abercromby and Webb, Loudon was confronted with a condition of affairs similar to that with which Montcalm had to contend — jealousy between colonials and regulars. The War Office had decreed that a colonial officer could not rank above a senior captain of regulars, and consequently well-seasoned officers, experienced in the methods of the enemy, were liable to orders from a man who had never been under fire, and had no knowledge whatever of colonial affairs. The British general seemed unable to decide upon any plan of action, and much valuable time was wasted. In the meanwhile, disaster had overtaken the British at Oswego. By clever tactics Montcalm had surprised the fort, and had 30 guns directed against it before the commander was aware of the danger which threatened him. There was little effective resistance, and capitulation necessarily followed; 1,600 men were made prisoners, and in a few days the fort was razed. The year was passing away without any important move on the part of the British. Loudon desired a change of scene, and induced the home government to agree to an expedition against Louisburg. Large reinforcements were sent out, and in the month of June 1757 he had nearly 12,000 men arrayed against that stronghold. Still unable to decide upon a plan of attack, he wasted a month in exercising the troops, or, as Lord Charles Howe said, "In keeping the courage of His Majesty's soldiers at bay, and in expending the nation's wealth in making sham fights and planting cabbages, when they ought to have been fighting the enemies of the king in reality." On 4 August a movement

CANADA — GREAT BRITAIN'S FIGHT WITH FRANCE

was set on foot, but intelligence was conveyed to the commander that the French expected reinforcements and were eager for the fray. Thereupon, the noble lord abandoned the enterprise and returned to New York, having covered himself with ridicule, and greatly amused the French.

In the spring of 1757, the region of Lake Champlain was the scene of unusual activity. The Indians from the distant shores of Lake Superior, and from the forests beyond Lake Erie, were rallying around the French standard; and by midsummer a restless band, eager for the fray and only restrained with difficulty, gathered at Fort Carillon as part of the expedition against the British strongholds of Fort Edward and Fort William Henry. Montcalm's army consisted of about 6,000 of the best troops, with the addition of the Indians. The British force was divided between the two forts. Webb was at Fort Edward in command of 3,500 men, and Munro had 2,000 men in Fort William Henry, and 500 entrenched upon a rising ground in the rear of the fort. Montcalm's first move, on approaching, was to occupy the route communicating with the forts, which, at the same time, cut off the British troops upon the rising ground. This was accomplished by de Lévis with 3,000 men. Montcalm strengthened his position and soon had 40 guns bearing upon the fort. From the first it was clear that the British position was untenable. Munro was twice offered terms of capitulation, but he stubbornly refused. At length he was forced to surrender, and the garrison marched out of the fort. Then followed a frightful scene which has unjustly tarnished the memory of Montcalm. The Indians, disappointed of the plunder to which they looked forward at the sack of the fort, fell upon the prisoners with fury, and horribly massacred nearly 100 before any means could be taken to prevent them. Montcalm and Lévis did their best to arrest the fury of the savage hordes, and saved many lives; but the mischief was done, and dire vengeance was threatened. Notwithstanding the dismal failure of Loudon, Pitt was still determined to reduce Louisburg, which was to be made the chief objective in the campaign of 1758. Loudon had been recalled, and the command was entrusted to Amherst, who had already done good service in Germany. The chief officers under him were Lawrence and Wolfe. The force consisted of about 12,000 men. On the second of June part of the fleet anchored in Gabarus Bay, a few miles from Louisburg, Boscawen being the admiral in command. The expedition was a joint one, both naval and military. Wolfe was the most conspicuous figure of all present. His brigade made the real attack from the boats, while Whitmore's and Lawrence's supported him by feints in other places. The landward siege was well pressed home, and Louisburg, the gateway of New France, soon fell, and being shortly after razed to the ground, literally became a thing of the past.

Success had attended British arms in other quarters. Bradstreet at the head of 3,000 men had captured Fort Frontenac, which the unwisdom of Vaudreuil had left inadequately supported, although it was a most important post commanding Lake Ontario and serving as a base for the Ohio forts. De Noyan, the gover-

nor, had demanded reinforcements, but, in the place of troops, Vaudreuil had dispatched a one-armed man to his assistance, and, as resistance was futile, capitulation followed. Fort Duquesne had also become a British post, and now bore the name of Fort Pitt. Forbes, in the face of great difficulties, had endured the perils and suffering of a winter's march; and, when at last his bravery and determination had triumphed over every obstacle, and the fort was in sight, he found that it had been evacuated. While Loudon was "planting cabbages," a harmless occupation, Abercomby was making a worse mess of affairs at Ticonderoga (q.v.). The French had been expecting an attack at this vital point, which commanded the route by way of Lake Champlain, and threatened Montreal. A large body of men had been ordered there in the spring by Montcalm; but the withdrawal of so many troops under Loudon, had convinced Vaudreuil that it would be an opportune moment to create a diversion on the Mohawk. Montcalm was opposed to this enterprise; consequently Vaudreuil insisted, and 1,600 men were detached for the purpose. By the middle of June Montcalm had only 3,000 men at Ticonderoga, the battalions of La Sarre, Languedoc, Béarn, Berri, Guienne, and Royal Roussillon, with two good engineers. The place was by no means strongly fortified, but works were hastily thrown up in advantageous positions. In the meantime the formidable army under Abercomby, consisting of regulars and provincials, in all 15,000 men, was encamped about half a mile from the fort. But the real head of the army, Lord Howe, the best soldier in America, as Wolfe had said, had been killed in a preliminary skirmish, and the commander was powerless to act. Something had to be done, however, and Abercomby moved his whole force against Carillon. Montcalm's army had been increased by 500 men under de Lévis; and after a seven hours' blundering assault, Abercomby was completely outgeneralled, and lost no less than 2,000 men. This victory covered Montcalm with glory, and he is frequently referred to as "the hero of Carillon." But although he had won glory for French arms, the victory was a blow to the jealous Vaudreuil, and signalized the farther accentuation of discord which produced serious results in future operations.

In 1759 Pitt was at last in a position to put his greater scheme into practice. The tide of war was almost on the turn, and he seized opportunity beforehand. The Seven Years' war (q.v.) was being waged in many parts of the world; in fact, in a purely military sense, there were several different wars going on at the same time. But there was one great connective force which made them one, and that was the British navy. France and England were now in the very middle of their great imperial war, which began after the fall of the Stuarts in 1688, and was continued as one single age-long and world-wide struggle for the over-sea dominion of the world, down to Trafalgar and Waterloo. The Seven Years' war was the most distinctively imperial phase of the whole of this vast conflict; the heart of it lay in the fight for American dominion; and the central episode of this fight itself is to be found in the expedition against Quebec, which culminated in the renowned battle of the Plains of Abraham. The

CANADA — GREAT BRITAIN'S FIGHT WITH FRANCE

four real conquerors of New France are Pitt, Anson, Saunders, and Wolfe. The names of Pitt and Wolfe have always been on every tongue; but the equally important ones of Anson and of Saunders have been unduly forgotten. Pitt, of course, was the originator; and in himself, the most important of the four. But as the whole fortunes of the war were really determined by the British command of the sea, it is absolutely necessary to understand the naval side of the campaign, not only for its own sake, but also to fully appreciate the work of the army. In the ever-memorable year of 1759, it was entirely due to the navy that England remained safe at home, and it was more than half due to the navy that she emerged as a conqueror abroad. France had prepared a gigantic scheme of invasion. One fleet was to sail for Ireland, where the troops were to be met on landing by a general rising in their favor. The Jacobites were to be stirred into insurrection by another French fleet destined for Scotland; whilst their third fleet, larger than both the others united, was to convoy innumerable troop-boats across the Channel, as they made a dash for the south of England. To guard against this national danger the navy then developed the first regular system of blockade ever known. Boscawen blockaded Toulon, Hawke blockaded Brest, Rodney cruised off Havre, and Admiral Smith kept the reserve fleet always ready in the Downs. Meanwhile, however, Pitt was preparing a counterstroke; not at France herself—where she would be stronger than England in a campaign fought out on her own home base—but at her over-sea possessions in Canada, from which she was separated by those 3,000 miles of hostile waters, which the British command of the sea had practically made a British possession. Thus Montcalm had to await attack in utter isolation, on the far side of an immense stretch of territorial waters, across which Wolfe advanced in perfect safety to meet him. And it must be remembered that Saunders' squadron was not only a strong one, for it comprised a full quarter of the whole navy, but that it was playing an integral part in a universal scheme of strategy—for all seas are strategically one—whilst Wolfe's little army was only a landing-party on a large scale. There were twice as many seamen as landsmen engaged in the taking of Quebec. Saunders had over 18,000 sailors, more than two thirds of whom belonged to the navy, while Wolfe had less than 9,000 soldiers. The total British force, therefore, amounted to 27,000 men. Saunders and Wolfe received their secret instructions from the King in February, and immediately after sailed for Nova Scotia. The final rendezvous was Louisburg, where over 8,000 men were assembled in May. On 1 June the fleet began its dangerous voyage, with no less than 200 vessels of all sorts and sizes. It was navigated in perfect safety to the Island of Orleans, where it arrived on 27 June, and was not injured by a tremendous gale a day or two later, nor by the costly display of fireworks, in the shape of fire ships, destined to work its destruction. The picket boats met the attack well up stream, and, "taking hell in tow," as a bluejacket forcibly expressed it, put all the enemy's vessels ashore, where they burnt themselves out. Wolfe established three camps.

The principal one was at Montmorency, just beyond the falls. The second was on the Island of Orleans, completely out of range, and thus very convenient for a hospital and stores. The third was at Point Levis, which Vaudreuil foolishly refused to occupy, in spite of Montcalm's sensible advice, and which was consequently left open for Wolfe to build his batteries on. These batteries literally pounded the town to pieces; as a manuscript note on a plan of the siege in the French War Office, truly remarks, "*ce ne fut pas un siège, mais un bombardement.*" Among other projectiles of all kinds, 36,000 solid cannon balls were fired from this coign of vantage. Montcalm's position was still immensely strong, in spite of the loss of the Levis Heights. The Upper Town of Quebec is built upon the extremity of a long promontory which is bounded on the south by steep cliffs, 200 or 300 feet sheer up above the Saint Lawrence, and on the north by lower, but still easily defensible, cliffs overlooking the valley of the Saint Charles. The town was held by 2,000 men under de Ramesay. It had a double tier of batteries, one on the top of the cliffs, the other along the water front below them. The only open ground in the vicinity was round the mouth of the Saint Charles. But this was well entrenched, and the trenches were carried on continuously for seven miles along the Beauport shore to the Montmorency, opposite Wolfe's camp.

Wolfe's first attempt to break through was made some distance up the Montmorency, where he tried to force his way across the fords and so attack the entrenchments in the rear. But he was repulsed with loss, in a bush-fight in which his regulars were at a great disadvantage. His second attempt was a more serious one. On 31 July he tried to carry the Montmorency Heights by storm, a mile on the Quebec side of the Falls. But as his troops had to be collected from several quarters, in full view of the French, Montcalm easily anticipated him at the right spot, before he could deliver the assault. Besides, the faulty British plan could not be carried out even according to Wolfe's intentions, because the grenadiers, 1,000 strong, suddenly broke into a wild charge before being properly formed up, and lost nearly half their numbers in a fruitless effort to scale the heights. Then a terrific thunderstorm burst on the scene of carnage, making the heights more slippery than ever, and so he had no choice but to call off his men at once. After this repulse Wolfe fell seriously ill, and towards the end of August he gave his brigadiers, Monckton, Townshend and Murray, a memorandum of three other plans for assaulting the trenches, and asked them "to consult together for the public utility." Their council of war resulted in a complete rejection of all his suggestions; because, as they well remarked, the storming of such works from open ground would certainly be both difficult and dangerous. Moreover, even if the works themselves were carried, there would still remain the fortified line of the Saint Charles, as well as the heights of the promontory beyond, to keep him out of Quebec, until the lateness of the season would compel him to raise the siege. Their own plan was to take all the available men up the Saint Lawrence, and land at any suitable point between Cap Rouge, which was nine miles, and

CANADA — UNDER BRITISH RULE TO CONFEDERATION

Pointe aux Trembles, which was 22 miles, above Quebec. Wolfe informed Pitt, in a dispatch written on 2 September, that he had acquiesced in this plan, and intended to put it into operation at once.

The Montmorency camp was cleverly evacuated, without the loss of a man, by a general naval and military demonstration against the entrenchments, which made the French feel sure that another attempt to storm the position there was about to take place. From 7 to 10 September the rain suspended all operations; and on 10 September Wolfe made his final reconnaissance. He was already well posted on the lie of the land in every direction, and the idea of attacking above Quebec was thoroughly familiar to his mind long before it was mentioned by his brigadiers. On 19 May he had said to his uncle, that he "reckoned on a smart action at the passage of the Saint Charles unless we can steal a detachment up the river and land it three, four, five miles, or more above Quebec." This plan was better than the brigadiers', as it contemplated seizing the ground much closer to Quebec than the nearest objective point they proposed trying. At the final reconnaissance he chose the Foulon, where a path led up to the Plains of Abraham, within two miles of the walls. If he could get up there without any serious check, he saw that he could forestall Montcalm by forming a line less than three quarters of a mile from the city, where the promontory was narrow enough to be commanded by his small army, and where the mixed regulars and irregulars of New France would be forced to meet his homogeneous British red-coats on a flat and open ground. The French were on the alert everywhere along the north shore, from the Falls up to Pointe aux Trembles, a distance of 29 miles — except just at the Foulon itself. They could not tell what Wolfe was about, nor where the bulk of his men were, behind the impenetrable screen of the ubiquitous British fleet. They were naturally very apprehensive of another desperate attack on their trenches; they were well prepared against an assault upon the town, which was so strongly fortified by nature; while the constant movement of the fleet, and occasional landings from it, in the vicinity of Pointe aux Trembles, 22 miles up, made them think that any new plan would probably take the form of an advance in force by land from somewhere thereabouts. One man, indeed, besides Wolfe, was thinking of the Foulon, and that man was Montcalm. On 5 September he had sent the regiment of Guienne to the Heights of Abraham, but Vaudreuil withdrew it on 7 September, and left no defense there, except the puny Samos battery near Sillery Point, and 100 militiamen at the top of the Foulon, under the treacherous Vergor. Even on 12 September, the very eve of the battle, Montcalm had again ordered the same regiment back, this time to the Foulon itself. However, Vaudreuil had again countermanded the order, saying, "We'll see about it to-morrow." But Wolfe himself was up there on that morrow! [For some account of the battle of the Plains of Abraham, see *COLONIAL WARS IN AMERICA; MONTCALM; QUEBEC; WOLFE.*]

The winter at Quebec, after its capture, was a terribly trying one for the little British garrison; and so many men died of scurvy that, in

the following April, when de Lévis marched out of Montreal with 7,200 men, expecting several thousand more to join him on the way, Murray could only muster 3,886 effectives. There was a second battle of the Plains, in which Lévis defeated Murray, who in less than two hours lost over one third of his men. A second investment followed, and Lévis was in the act of advancing to storm the walls, when the vanguard of the British fleet suddenly entered the harbor. The French had now no choice of action. They hurriedly abandoned their camp, and retreated, in all haste, on Montreal, both by land and water. Then, step by step, the final British advance converged on the doomed colony. Murray came up steadily from Quebec, in close touch with Lord Colville's squadron, which the French had absolutely no means of resisting. Haviland advanced from the south by way of Lake Champlain; while Amherst, with the main army, came down the Saint Lawrence from the Lakes. When the united British army, 17,000 strong, actually landed on the Island of Montreal, the few remaining Canadians deserted Lévis in a body, and he found himself left with only some 2,000 of the faithful French regulars. The capitulation of New France occurred two days later, on 8 Sept. 1760. The French troops were deported. The Canadians had already dispersed. The American militia went back to their homes. The fleet sailed away to their stations. The British regulars took up their winter quarters. And the New Régime began. The Seven Years' War was one of the most pregnant events in history; and its results have continued to exert a vast determining influence on the fortunes of every world power, down to the present day. In Europe it foretold the ultimate decline of France and Austria, and the ultimate rise of Prussia to the leadership of Germany. But its significance for the English-speaking people lies mainly in the fact that it was the most truly imperial war they ever waged; and its most dramatic episode — the battle of the Plains of Abraham — will serve to mark forever three vital stages in three great epochs of modern times — the passing of Greater France, the coming of age of Greater Britain, and the birth of the United States.

ARTHUR G. DOUGHTY,

Dominion Archivist, Author of 'The Battle of the Plains,' etc.

Canada — Under British Rule to Confederation (1760-1864). At the moment when Vaudreuil (see VAUDREUIL-CAVAGNAL, PIERRE) capitulated to Amherst (September 1760) (see MONTREAL — *History*) there were no English in Canada save the troops and a few civilians who had come with them. But, outwardly at least, this act of surrender placed the French Canadians and the English colonists in America on the same basis as subjects of the British crown. One sovereignty was thus established over a vast area where dwelt two races whose origin, sentiments, faith and institutions marked them off from each other in the sharpest contrast. A century later the face of the situation was profoundly changed. The American Revolution had created a second sovereignty in this region at a time when the population of Canada was almost wholly French, and yet by 1860 the Canadian English had come to outnumber the Canadian French. The maintenance of the bond with

CANADA — UNDER BRITISH RULE TO CONFEDERATION

Great Britain, the rise of the United States and the influx of English settlers are the broad conditions which have affected the progress of Canada since the cession.

Three years elapsed between Vaudreuil's surrender and the Treaty of Paris, which confirmed Great Britain in the possession of her American conquests. During this interval the country remained under military rule, and though Gen. Murray's relations with the subject population were marked by sympathy and tact, it was impossible that a sense of permanence should be inspired by such a document as the Act of Capitulation. The text of the treaty, in its turn, left many essential points unsettled, especially in the domain of law, and not until 1774, when the Quebec Act was passed, did French Canada receive from the British crown and Parliament a charter upon which it could rely. The first 14 years of British rule were, however, a time of great importance in that the experience gained during this period suggested legislation which continues in force at the present day. The mass of the French population, *seigneurs* and *habitants* alike, accepted the change of masters in a spirit of resignation. Their courageous support of Montcalm and Lévis is proved by a large variety of evidence. They seem to have shown as much daring as the French regulars, together with a superior knowledge of the country and a better grasp of the tactics which were suited to American warfare. That the deportation of the Acadians had stimulated their resistance to the British is more than probable, but in any case loyalty and patriotism would have led them to make a brave defence. Once beaten, they accepted the situation frankly and were not encouraged to rebel by that restlessness of the Indian tribes which took form in the conspiracy of Pontiac (1763-4) (see PONTIAC). The contrast between their docility and the growing disaffection of New England and Virginia did not fail to leave an impression on the official mind both in Quebec and London. The result was that when difficulties arose between them and their English fellow-subjects the government was not disposed to espouse the cause of the latter. Apart from the retention of their property, the guarantee of their religious institutions was the question which came nearest to the hearts of the French Canadians. By Article 27 of Vaudreuil's Capitulation it was agreed that "the free exercise of the Catholic, Apostolic and Roman religion shall subsist entire, in such manner that all classes and peoples of the towns and rural districts, places, and distant posts may continue to assemble in churches, and to frequent the sacraments as heretofore, without being molested in any manner, directly or indirectly." This clause of the capitulation was confirmed at the Treaty of Paris (see PARIS, TREATIES OF) with the condition "as far as the laws of Great Britain permit," but any restriction which might seem to be placed upon religious toleration by the foregoing phrase was nominal rather than real. The communities of nuns were not disturbed even at first, and after a few years of deprivation large estates were restored to the Sulpicians. The Jesuits also would probably have received a confirmation of title but for the special circumstances attending their suppression in France shortly before the Treaty of Paris and their general suppression in 1773. As

it was, the scrupulous care with which governors like Murray and Carleton (see CARLETON, SIR GUY) carried out the policy of toleration reassured the hierarchy and made it a firm supporter of British rule.

Had there been no other factors in the political life of the country than the government and the French Canadians, the first years of the new order would have been peaceful enough. It is true that the commission of Governor Murray (1763) was marked by ill-advised expressions. For example, the members of such an assembly as might hereafter be convened by the governor and council "shall, before their sitting, take the oaths mentioned in the act entitled 'An Act for the further security of his Majesty's person and government, and the succession of the Crown in the heirs of the late Princess Sophia, being Protestants,'" etc. In other words, every French Canadian who aspired to sit in the assembly of the colony must subscribe a declaration against transubstantiation, the adoration of the Virgin and the sacrifice of the mass. Such language (borrowed from the laws of England) would have seemed offensive had political life become active in the colony, but as no assembly was convened till 1791 it remained shorn of practical significance. Real difficulty sprang less from the disaffection of the "new subjects" than from the presence in Canada of certain "old subjects," that is to say, of the English who had come to Quebec and Montreal at the close of the war. Here was a fresh element in the population, small but active and bitterly opposed to the recognition of French institutions. Prior to the outbreak of the Revolution an influential proportion of the English living in Canada were natives of the American colonies who had moved to the northern part of the British dominions with the design of enriching themselves through the fur-trade. Their antagonism to the French was prompted partly by race and religion but also by dislike of French law and contempt for the conservatism of French character. Their plea was that since the fate of war had given Canada to the English the country should be made in the fullest sense a British possession. These "old subjects," but just arrived in the colony, would have uprooted French law, discouraged the use of the French language, destroyed or fettered the hierarchy, and incidentally have made themselves a dominant class. At no time before the passage of the Quebec Act could they have formed more than a fiftieth part of the population, but, owing to the strength with which they raised the cry of the ruling race, they enjoyed a position of great prominence. Unfortunately for the success of their programme, they incurred the dislike of the local authorities by an extreme radicalism of utterance and demeanor. Carleton, in particular, discountenanced them and held them to be infected with the mutinous views which were becoming so increasingly prevalent in the English colonies.

Sir Guy Carleton, afterwards Lord Dorchester, is the most striking figure in Canadian history from the Conquest to the days of responsible government. The close friend and confidant of Wolfe, he began his career as a soldier. Circumstances made him an administrator and he ended by reaching the full stature of a statesman. Those who approve the policy

CANADA — UNDER BRITISH RULE TO CONFEDERATION

embodied in the Quebec Act will, of course, rank him higher than he will be ranked by those who deny the wisdom of that far-reaching measure, but regarding the quality of his mind, the firmness of his temper, and the justice of his intentions, opinion is undivided. After serving with distinction in the campaigns of 1759 and 1760 he returned to Canada as administrator of the government in 1766. In 1769 he became governor-in-chief; and from this date until his final surrender of office in 1796 he remained among all Englishmen the leading authority on Canadian affairs. The Quebec Act was the fruit of information and advice which he supplied; it was he who repelled Montgomery's invasion, and the Constitutional Act of 1791 which gave the colony its first training in self-government was largely his work. During a formative period of 30 years his policy of generosity towards the defeated race was the policy of the British government. Murray, whose language reflects personal resentment, says of the "old subjects": "I report them to be in general the most immoral collection of men I ever knew." Carleton, though less severe in his strictures, formed a highly unfavorable opinion of them and expressed his preference for the French Canadians with perfect freedom. According to his forecast, which in this respect has not been altogether justified, the valley of the Saint Lawrence was unlikely to be inhabited by any large number of Englishmen. Most of the English who were then resident in Montreal and Quebec had come in the train of the troops and would probably return with them. The traders had not been successful and would soon disappear. To quote his own words, it remained that "barring a catastrophe too shocking to think of, this country must to the end of time be peopled by the Canadian race." The Canadians, he continues, "are not a migration of Britons, who brought with them the laws of England, but a populous and long-established colony." Thus believing that the French could never be supplanted he concluded that their customs, ecclesiastical and legal, should be retained. A detailed statement regarding the Quebec Act will be found elsewhere (see CANADA — THE QUEBEC ACT). Here it need only be said that its territorial provisions were extremely distasteful to the English colonies and that its concessions to the French Canadians have supplied a solid groundwork for their loyalty to the British Crown. Whether Sir Etienne Taché was correct when he said, "The last gun that will be fired for British supremacy in America will be fired by a French Canadian," must be termed matter of conjecture; but the sentiment which prompted him to speak so fervently was gratitude for the Quebec Act. This measure provided an unobjectionable oath of allegiance, sanctioned the Roman Catholic religion in so far as it did not conflict with the king's supremacy, and ordained that "in all matters of controversy relating to property and civil rights, resort shall be had to the laws of Canada as the rule for the decision of the same." Hence English criminal law and French civil law were established side by side in the regions covered by the act. When Upper Canada was constituted in 1791 it received the common law of England unmodified and unlimited, but French civil law still survives in the Province of Quebec.

At the same moment when Great Britain was

endeavoring to meet the wishes of her French subjects, the question of Canada was becoming an additional source of friction between the mother country and her older colonies in America. Not only did the English colonies disapprove a policy which heaped such favors upon the French, but some of them resented the king's disposition of the recently acquired territory to the west of the Alleghenies. In the royal proclamation of 1763 nothing was said concerning the government of this valuable region, an omission which disappointed Virginia and other colonies ambitious of expansion. Worse still, the Quebec Act handed over the western country to Canada, shutting out the older colonies and rendering an immense area subject to the operation of French civil law. At any time such action would have provoked remonstrance; in 1774 it quickened the resentment which had been gathering force ever since the passage of the Stamp Act. How prominent Canada was in the eyes of the Continental Congress may be inferred from the decision, speedily formed, to gain control of it by force. The sequel was a severe blow to the Revolutionary cause. Montgomery (see MONTGOMERY, RICHARD), advancing by Lake Champlain and the Richelieu, occupied Montreal and nearly succeeded in capturing Carleton, who was the head and front of the defense. Simultaneously Benedict Arnold (q.v.) made his way through the woods of Maine to the valley of the Chaudière and despite dreadful privations appeared before the walls of Quebec. On the arrival of Montgomery from Montreal a siege was commenced, but the sufferings of the troops proved so intolerable that it was decided to carry the town by assault. On 31 Dec. 1775, the two generals made a desperate attempt to force a passage through the streets of the Lower Town. During the fight which ensued Montgomery was killed and after a sharp encounter Carleton drove out the invaders with heavy loss. The war in Canada dragged on during the greater part of 1776 but before the close of that year the Americans had been repulsed at all points and the issue, so far as it affected Quebec was decided. On the British side the hero of this campaign is undoubtedly Carleton, who maintained his position against heavy odds; but considered historically the attitude of the French Canadians is no less interesting. The clergy and the *seigneurs* used their influence actively on behalf of the British; the *habitants* remained neutral. It seems clear, however, that without the aid which he received from Canadian volunteers, Carleton would have been beaten, and it is also manifest that the French peasantry did not respond with any heartiness to the appeals of the Continental Congress.

While Montgomery's invasion is an exciting and critical episode, the Revolution affected Canada still more profoundly by causing the emigration of the United Empire Loyalists (see LOYALISTS). Into the nature of their differences with the American patriots it is not necessary to go, beyond stating that each party represented a definite point of view and was separated from its opponents by the wide gulf of contrasted ideals. The Loyalists represent the conservative element in the Thirteen Colonies and undoubtedly embraced within their ranks a large proportion of distinguished, educated men. Including those who left their homes while the war was in progress

CANADA — UNDER BRITISH RULE TO CONFEDERATION

and those who came northwards after its close, we may place the total number of Loyalist emigrants in British North America at nearly 40,000. More than half of these newcomers settled in the neighborhood of the Bay of Fundy, particularly in the region which now forms the province of New Brunswick, but at least 10,000 of them made their way to Canada. It is at this period that important settlements are first established upon the northern shore of Lake Ontario, where a population exclusively English possessed itself of lands which the French had explored but never colonized. The population of Canada was further modified between 1783 and 1800 by the opening up of the Eastern Townships, a district situated on the northern border of New Hampshire and Vermont, with a short frontier on the northeastern corner of New York. Here the original settlements were made in part by Loyalists but more largely by emigrants from New England who moved north in quest of cheap land. At the close of the Revolution, then, the race question in Canada begins to assume a very different aspect from that which it had worn before the passage of the Quebec Act. Then the English population constituted a mere handful. Now, through the steady influx of immigrants from the United States fresh portions of the country are developed and a nucleus is formed round which later accessions of English-speaking colonists will range themselves. As the bulk of the new population professed the deepest affection for Great Britain, a separatist movement was not to be thought of, but it was equally certain that disagreement would arise within Canada over the issue of legal and ecclesiastical institutions. As early as 1785 the Loyalists resident on and near Lake Ontario sent a petition to England praying that they might enjoy "the blessings of British laws and British government and of exemption from French tenure of property." Carleton, now Lord Dorchester, was eminently suited to effect an arrangement between the Loyalists and the French Canadians, towards both of whom he was drawn by feelings of strong sympathy. After establishing in 1788 special regulations for the administration of districts inhabited by Loyalists, he assisted in the preparation of the Constitutional Act (1791), a measure which was designed to do away with the grievances of the Loyalists without creating a sense of grievance among the French. Under the Constitutional Act, which in the British Parliament received support from Pitt and Burke, a division was made between Upper and Lower Canada. For each of these provinces the act created a legislative council and an assembly, but no independent power with respect to tariff legislation was granted. Clergymen of whatever denomination were declared ineligible to sit either in the council or the assembly, but freedom of worship was guaranteed to the Catholics in perpetuity and the Protestant clergy received as an endowment one seventh of all waste lands belonging to the crown. Some idea of the relative importance of the two provinces at this date may be gathered from the fact that in Lower Canada the legislative council was to consist of not less than 15 members, while in Upper Canada the minimum number was placed at seven. A still greater disproportion existed between the number of members in the assembly — a minimum of 50 in Lower Canada as op-

posed to a minimum of 16 in the other province. Although grave troubles afterwards arose under the operation of the Constitutional Act, the measure seems to have encountered little opposition in Canada save from the English minority in Quebec, whose leaders looked forward with discontent to the prospect of political inferiority. No tests excluded Roman Catholics from the council or the assembly, and after the elections of 1792 the latter body in Lower Canada contained 34 French as against 16 English members.

Within six months from the day when the first Canadian legislature met, Great Britain joined Austria and Prussia in their war against revolutionary France. While British North America was not drawn into the vortex of England's contest with the Convention, the Directory and the Napoleonic Empire, it felt the influence of that long struggle in more ways than one. Besides Canada's part in the war of 1812, which was a by-product of the larger strife, one must mention the attempt of French republicans to make trouble for England in Lower Canada, and a certain neglect of Canadian issues by the home government which may be ascribed to the pressure of more critical questions in Europe. At about the same time when Genet was endeavoring to raise the United States against Great Britain, agents of the National Convention sought to provoke a disturbance among the *habitants* of Quebec. The execution of McLane and the imprisonment of Fréchette for life are the chief incidents in this abortive undertaking. Of much more consequence was the failure of the colonial office to watch the working of the Constitutional Act in Lower Canada. The council, whose members were appointed by the governor, speedily became a stronghold of English interests. The assembly, whose members were chosen by popular vote, assumed no less speedily a French complexion. As the council considered itself to represent the dominant power and was quite free from the control of the assembly, it tended to assume a tone which was extremely offensive to the French majority in the other house. The Constitutional Act gave representation but did not recognize the principle of ministerial responsibility to the popular branch of the legislature. In an age of mounting democracy, this type of government was open to fierce attack, especially when the question was complicated by racial prejudice. Between 1791 and 1812 the most maladroit governor of Lower Canada was Sir James Craig, who for three years (1808-10) carried on open strife with the assembly and finally had recourse to a *coup d'état*. In his assault upon the 'Canadien,' a nationalist newspaper, he unwarrantably arrested Bedard as the publisher of treasonable articles, dismissed Panet, the speaker of the assembly, from the militia, and eventually imprisoned six of the leading members of the assembly. Craig's action was due to a sincere belief that the French Canadians were disloyal because they criticized the council, but the effect of his measures was most unfortunate, since the Colonial Office could not fail to be identified with them in the public mind. The political life of Upper Canada during the same period was unmarked by any notable dissensions. Through no fault of her own, and simply by virtue of being a British possession, Canada was drawn

CANADA — UNDER BRITISH RULE TO CONFEDERATION

into the war of 1812 (see UNITED STATES — THE WAR OF 1812). Among the causes of the war, the only one which concerned her directly was the ill-founded contention that English officials were trying to stir up an Indian attack upon the American colonists in the West. From the outbreak of hostilities till the conclusion of peace Canadians of both provinces conducted the defence of their country in a truly patriotic spirit. The Loyalists were stimulated by the memory of their expatriation and fought enthusiastically for the British cause under Brock and Sheaffe. The French Canadians guided by Bishop Plessis (see PLESSIS, JOSEPH OCTAVE) of Quebec, himself the descendant of a New England captive, displayed an attachment to England which had not been so clearly apparent at the time of Montgomery's invasion. De Salaberry's victory at Chateauguay showed that the French peasants had not lost their ancestral courage or their knowledge of the methods to be pursued in guerilla warfare. At Queens-town Heights (see QUEENSTOWN) and Lundy's Lane (see LUNDY'S LANE, BATTLE OF) the Loyalists acquitted themselves well in the open field. The war of 1812 contributed much to the formation of a patriotic sentiment which was independent of provincial bounds.

The political unrest which affected most civilized countries in the generation following the Battle of Waterloo, appeared in Canada under an acute form and was not quieted until after the Rebellion of 1837. The Upper Province, free from the problem of a mixed nationality, had hitherto been undisturbed by violent disputes, but as time went on the Constitutional Act was found unsatisfactory—or rather, the act gave no redress of the grievances which grew up under the existing system of administration. In Lower Canada the claims of the assembly found an eloquent champion in Louis Joseph Papineau (q.v.), the most prominent French Canadian of his generation. It should be clearly pointed out that the grounds of discord were different in the two provinces, but the development of agitation went on simultaneously and the two movements, each proceeding from its own set of conditions reacted strongly on each other. English radicals and French radicals were brought into close sympathy as agitators by their common opposition to the established order. In both cases there were minorities whose privileges depended upon the maintenance of the constitution and the bitterness of the struggle for responsible government was intensified by the presence of these vested interests. In Upper Canada the contest between officialism and reform did not centre round the first principles of politics so much as it did round the exercise of power by certain individuals. The main strife was one of old settlers against new, with several minor issues coming in to complicate the situation and render it disagreeable. A few leading families of Loyalist stock constituted a local oligarchy from which were drawn the chief officials of the colony. As the members of this ruling class belonged almost wholly to the Anglican Church, and used their influence freely to benefit the Anglican clergy, they provoked the opposition of the dissenters who formed a majority of the more recent immigrants. The political solidarity of Anglicanism and the "Family Compact" led both to be denounced by the champions of responsible gov-

ernment—Robert Gourlay, William Lyon Mackenzie, Dr. Rolph and Egerton Ryerson. The clergy reserves were represented as a symbol of government by privilege and Roman Catholics united with Protestant dissenters to demand the application of their proceeds toward the support of schools. It will be seen that these sources of discontent were hardly of a fundamental character, but the population of Upper Canada was not one to bear political grievances lightly. In Lower Canada the situation was more intricate and more serious. When the excitement caused by the War of 1812 had died away, the relations between council and assembly resumed their former rancor, while the assembly and the executive became involved in a protracted dispute over the power of the purse. By the financial provisions of the constitution certain revenues were at the disposition of the crown and the assembly had control of certain other revenues which originally were much smaller. Through the development of the colony, the assembly's share of the revenue kept growing larger in proportion to that of the crown, and at the same time the radicals discovered that they could place the government in a very awkward position by refusing their assent to appropriations. The advantage which the assembly possessed through its power to keep up a perpetual dispute over fiscal matters was used with much tactical cleverness, though perhaps with less genuine patriotism than might have been desired. The fight against privilege (and there can be no doubt that the council had excessive privileges) was accompanied by a revival of racial feeling among the French Canadians. With Papineau for their leader the nationalist majority in the assembly used language which showed that their brightest ideal was not summed up in subjection to British sway. Gradually the English element was eliminated from the ranks of the reformers, and though a few politicians of English and Irish name supported Papineau during the disturbances of 1837 his sole hope of success lay in the support of the French. Under such a system of government as was provided by the Constitutional Act, the role of the governor assumed a degree of importance which it does not possess at present in any self-governing colony of the British Empire. Had abler men than Sir Francis Bond Head and Lord Gosford represented the crown in Upper and Lower Canada during the acrimonious debates of 1836, there might have been no breach of the peace. As it was, risings took place in both provinces, the radicals of Upper Canada being encouraged by some initial successes which the party of Papineau had gained in the autumn of 1837. The Rebellion cannot be dignified by the name of a war since the engagements were accompanied by slight fatalities and the issue was never in doubt. The French Canadian peasants who took the field were defeated at Saint Charles and Saint Eustache, and in Upper Canada the appeal to force collapsed after a farcical skirmish at Montgomery's Tavern, near Toronto. In 1838 fresh disturbances occurred at a few places in Lower Canada, only to be repressed with a promptness which showed the futility of further resistance. Apart from the domestic bitterness occasioned by these outbreaks, they were the cause of a diplomatic crisis, in that the activity of Mackenzie's American sympathizers led to strained

CANADA — UNDER BRITISH RULE TO CONFEDERATION

relations between Great Britain and the United States. The burning of the *Caroline* (q.v.) and the fight at Pelee Island (q.v.) were international episodes of the first importance.

The best fruit of the Rebellion was Lord Durham's Report and the transformation of British colonial methods which followed it. In 1838 the Earl of Durham (see DURHAM, J. G. L., EARL OF) was sent to Canada as governor-general and given a commission to investigate the state of the country. The blue-book in which he described the causes of the Rebellion and suggested remedies for obvious evils is held, by common consent, to rank first among the documents of the Colonial Office. Whether the text was written by Durham or Charles Buller, or by both in conjunction with Gibbon Wakefield, the report as it stands is a classic in political literature. The two essential recommendations which it makes are that responsible government be freely conceded and that the provinces of Upper and Lower Canada be reunited with a view to allaying the racial discord which had raged so fiercely in Quebec under the Constitutional Act. The Union Act of 1840 was the immediate sequel of Lord Durham's proposals and a first step towards the political consolidation of British North America. The salient feature of this constitution may be defined as the transfer of political power to an assembly which was chosen on a very democratic basis, though not by universal suffrage. The legislative council, with members appointed by the crown, was retained but real authority centered in the popular branch of the legislature. To the assembly each province contributed 42 members and it was provided that a general election should be held every four years, subject to the chance of a dissolution by the governor-general during the interval. The Union Act had imperfections and inconveniences which finally furnished a strong argument in favor of confederation, but under it (1840-67) Canada gained a political training which was invaluable and escaped from the worst of the anomalies that had provoked the Rebellion. At first the act seemed to favor the English, inasmuch as French ceased to be an official language; but in 1848 it was restored to its former position of parity. With the establishment of democratic principles the party system reached a maturity which before had been unknown in Canada. Lafontaine (see LAFONTAINE, SIR LOUIS H.), Baldwin (see BALDWIN, ROBERT), McNab (see McNAB, SIR ALAN N.), Macdonald (see MACDONALD, SIR JOHN A.), Brown (see BROWN, GEORGE), Cartier (see CARTIER, SIR GEORGE E.), and many other accomplished politicians found free scope for their talents in the ranks of Reformers or Conservatives. Much of the legislation which marks this period (for example, the abolition of seigniorial tenure in 1854) was designed to adjust the life of Canada to modern conditions, even at the cost of parting with a picturesque institution or discarding an ancient view of the relations which should subsist between church and state. The Reformers, however, had no exclusive possession of the liberal spirit, for it was a Conservative administration which abolished the clergy reserves. Education in both provinces began to receive an amount of attention which had not been paid to it hitherto. Judged also by economic results the progress of

Canada under the Union Act was extremely satisfactory.

As the confederation movement is considered separately (see CANADA — THE CONFEDERATION), it will be unnecessary to discuss here the causes which suggested to Canadians a larger political conception than is represented by the Union Act. But in conclusion some reference should be made to the progress of Canada as affected by its relations with England on the one hand and with the United States on the other. From 1840 onwards the country enjoyed self-government in all matters of a local or domestic character, but it remained a colony and never considered itself to be a co-ordinate part of the British Empire. In the second quarter of the 19th century the fixed belief of English ministers was that colonies are a kind of fruit which drops off the parent tree when it has become ripe. The rebellion of 1837 coming when liberal principles were triumphant in the mother country prompted the adoption of a generous colonial policy which has never been abandoned, but its effect upon the rise of imperial sentiment was only indirect. Yet notwithstanding the absence of a full partnership between Canada and England, the loyalty of the colony was signally illustrated during the first century of British rule. Despite friction between races, the pressure of foreign invasion and the existence of political privilege in both provinces, the attachment of an overwhelming majority of the population to British institutions and the British connection remained firm even throughout the decade that preceded the rebellion. The division which the American Revolution created between the United States and British North America, could not fail to affect the fortunes of Canada in the most vital manner. Apart from the importance of the Loyalist immigration, the rise of a new and powerful state on the southern frontier brought into being conditions which thenceforth could never be ignored. As early as 1775 a small but active minority would have preferred membership in the band of revolted colonies, and ever since there have been individual advocates of annexation. But this propaganda has never spread widely or gone beyond the theoretical stage. In addition to the war of 1812 and the irritation caused by the filibustering raids of 1838, the question of boundaries was for long periods together unpleasantly prominent. The Webster-Ashburton Treaty of 1842, though it was received with great dissatisfaction in New Brunswick and Quebec, did good rather than harm by settling an irritating dispute. The Reciprocity Treaty of 1854, which was largely due to the efforts of Lord Elgin, brought the two countries into more direct contact than ever before, promoted friendly intercourse, and was a source of prosperity to Canada during the 13 years of its existence (1854-67). Its repeal by the United States was in large measure due to a resentment which had arisen from Great Britain's attitude during the American Civil War. The fact remains that in its birth year the Dominion of Canada was excluded, by action not its own, from reciprocity in natural products with United States. See CANADA — UNDER FRENCH RULE; CANADA — THE CLERGY RESERVES; CANADA — SEIGNIORIAL TENURE.

Professor of History, McGill University.

CANADA — THE MARITIME PROVINCES TO CONFEDERATION

Canada — The Maritime Provinces to Confederation. The early history of the three eastern sea-board provinces of Canada is an important incident in the long dramatic struggle between France and England for world-empire. (See CANADA.) Their place on the map linked their destinies with those of New France on the one hand, and of New England on the other. The tale of their settlement and organization into communities is part of a greater story, the overflow of European peoples into the New World. They have been profoundly affected by great events outside their borders, European wars, and political changes on this continent; and if they have not as yet reacted on the history of the world, as a nation they are young; their history is yet to make.

Nova Scotia.—In 1604, Sieur de Monts, a Huguenot gentleman adventurer and trusted soldier of Henry IV., made a voyage to the great Atlantic peninsula, which is now called Nova Scotia (q.v.). He was to found a colony in return for his broad patent to trade in furs. After exploring the rugged eastern and southern coast-line, he discovered the beautiful Annapolis Basin, and wintered, suffering terribly, on the island of Saint Croix. The next year, after searching as far south as Cape Cod for a suitable place, he turned back to the Annapolis Basin, and planted his colony on its shores, naming the cluster of huts Port Royal. The colony did not flourish, and, in 1613, it was destroyed by a force under Argall from the newly founded colony of Virginia.

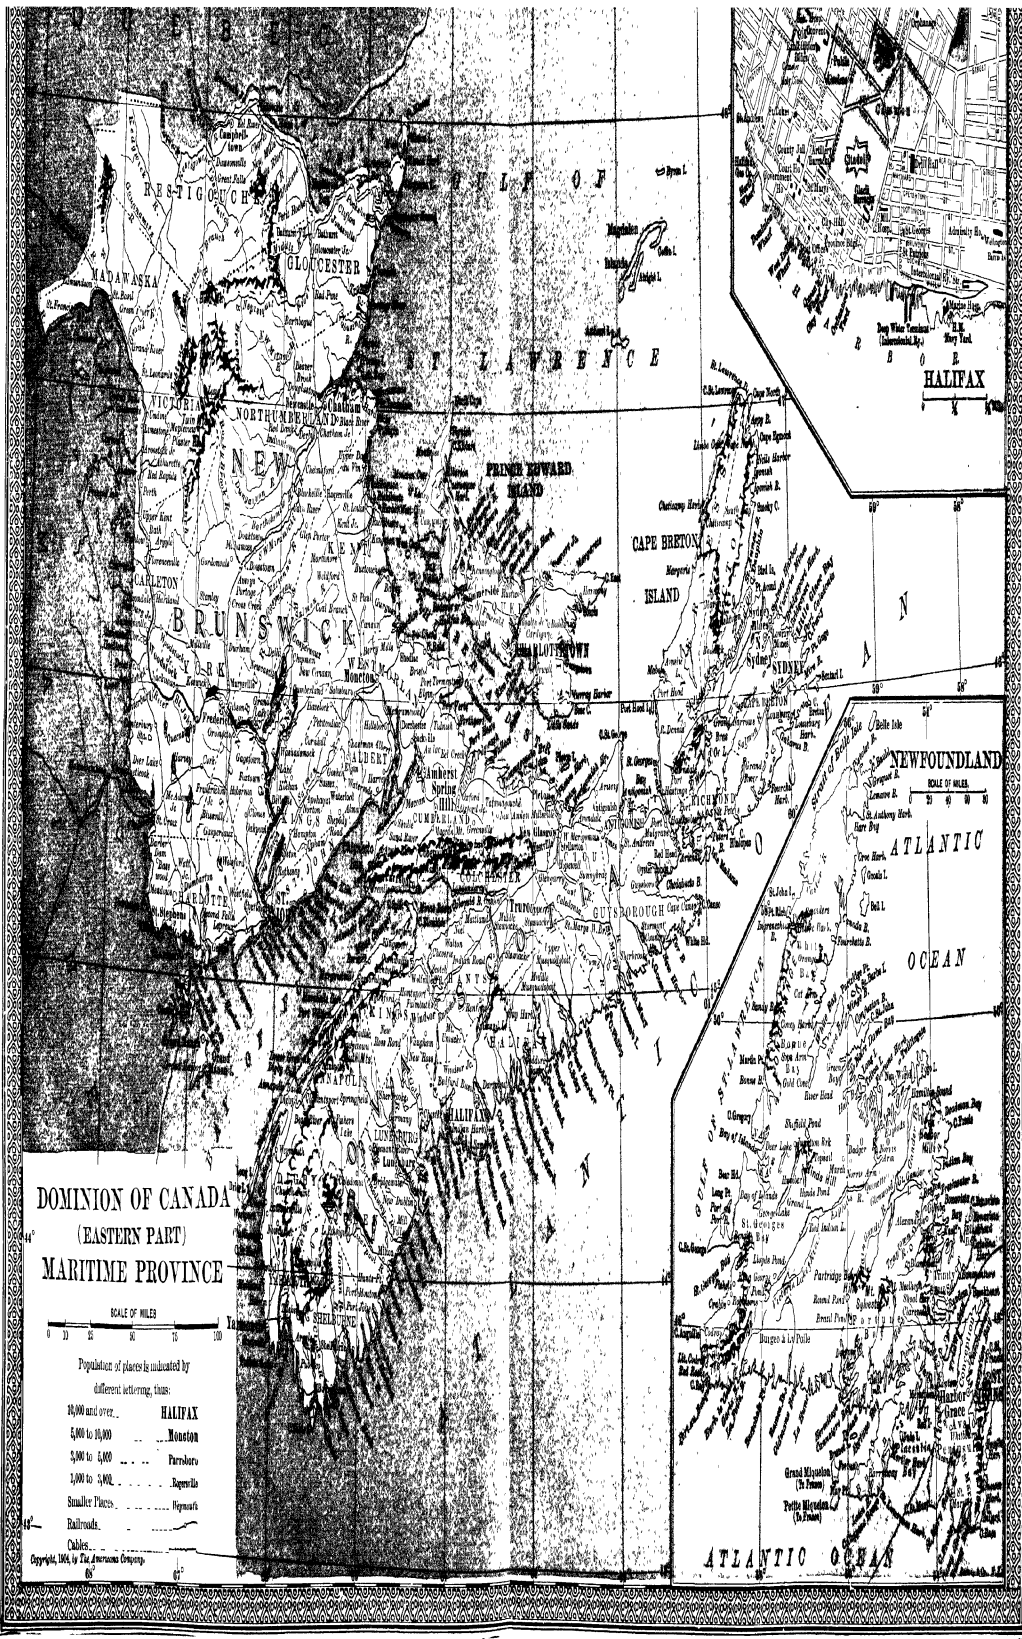

The French name for the country was Acadie, a musical native word, often mistaken for Arcady. It means "abounding in," as in Shubenacadie, and covered an ill-defined tract of wilderness, comprising what is now Nova Scotia, New Brunswick (q.v.), and part of Maine. In 1621, this territory was granted by James I. to Sir William Alexander (q.v.), a Scottish gentleman, to be colonized on a plan distinctly mediæval. Alexander was to parcel out his province in "baronies," six miles long by three deep, to gentlemen, who were to "plant" them with settlers. Each baronet was to have almost regal powers within his own domain, even striking his own coinage, and "repledging" criminals from the King's courts of law to his own. The colony was to be a new Scotland, even by a legal fiction, part of the county of Edinburgh. One small settlement was actually made on the Annapolis Basin in 1629, but it came to nothing, and the whole province was handed back to France in 1632, by the treaty of Saint Germain-en-Laye. Still, to this day, the Baronets of Nova Scotia form a distinct order in the British aristocracy, and the provincial flag bears the azure saltire of Sir William Alexander and the ruddy lion of Scotland ramping in gold.

For 22 years, the French had undisputed possession, and succeeded in planting a colony on the feudal pattern, as far removed as possible in principle from republican New England. The government was military and paternal; the land was held by seigniors and tilled by a docile tenantry. The *habitants* were chiefly unlettered peasants from the country about Rochelle. In Acadie, they found broad marsh lands beside tidal waters, resembling the country they had left. Here they settled, built long dykes of logs and earth on the river banks, and peacefully cultivated the rich fields the salt tides fertilized.

Population grew slowly. In 1671, there were 378 persons in the colony; in 1683, 600, chiefly about Port Royal. An interesting census of Acadie was made in 1686 by de Meulles, intendant of New France, who visited the scattered settlements and numbered the families, acres of cleared ground, boys, girls, fusils, horned cattle, swine and sheep in each. The population had grown to 915, including 30 soldiers at Port Royal. Although thickest about the seat of government, the Acadians had spread along the coasts and as far as Beaubassin at the head of the Bay of Fundy. They were a race of husbandmen, growing wheat, pease and rye; and raising cattle, sheep, swine and poultry; they also built small boats for the shore fisheries. An observer relates that when the manure-heaps beside their barns grew unmanageable, they moved the barns. Few women came with the first settlers, who married with the Indians, and always lived on friendly terms with them. Priests of the Sulpicians and Missions-Etrangères were their trusted guides both before and after the English conquest. See CANADA — ACADIAN REFUGEES.

Throughout this period, the chief interest lies in the shifting fortunes of one family. Claude de St. Etienne, Sieur de la Tour, a ruined Huguenot gentleman of Champagne came out early in the 17th century, with his son, Charles Amador, a boy of fourteen, to better himself in the new colony. After Argall's raid, the two lived for years like Indians among the Indians. Their stronghold was Fort Saint Louis at Cape Sable, on the inlet now known as Port Latour. In 1627, Charles petitioned Louis XIII. to be made commander of the coasts of Acadie, and his father took the petition to the French Court. On his return voyage the next year, he was captured by Kirk's fleet and taken prisoner to England. Here he became a friend of Sir William Alexander, married a maid of honor to Queen Henrietta Maria and was made a Baronet of Nova Scotia, as well as his son, with large grants of land to support their titles. With two men-of-war, he came back to Cape Sable, where Charles held the one solitary post for France in Acadie. By persuasion, and at last, by force, he strove to win his son over. Failing in both, he begged permission to live in Acadie, rather than return to England in shame, or to France and lose his head. This Charles granted, and Claude with his bride, his effects, two valets and two *femmes de chambre* disembarked. In 1635 Denys the historian found them living there in comfort.

Louis XIII. rewarded Charles' loyalty by making him his lieutenant-general in Acadie. In 1632, Isaac de Razilly took possession of the province in the name of France; his chief officers were La Tour the younger and D'Aulnay Charnizay. On the death of de Razilly in 1636, the territory was divided between the two; La Tour established himself in baronial state at the mouth of the Saint John, with his Huguenot bride, while D'Aulnay made Port Royal, across the bay, his headquarters. D'Aulnay intrigued against his rival at the court of France and procured his recall to answer charges of fraud upon de Biencourt, his former commander. La Tour refused to go to France, and tried to enlist the Puritans of Boston on his side. Failing them, he obtained help from Rochelle; the "proud city of the waters" sent him supplies, munitions of

war and 140 soldiers in the Clement. When the Clement arrived in the spring of 1643, she found Fort Saint John closely beset by D'Aulnay and 500 men. Being closely pressed, La Tour and his devoted wife slipped through the blockade by night, reached Boston safely, returned with reinforcements and drove D'Aulnay back to Port Royal. But D'Aulnay's hate was not easily tired. He went to France to raise another force against his enemy. At the same time, Madame La Tour went to Rochelle, to gather aid for her husband. D'Aulnay heard of her presence there and tried to have her arrested, but she escaped to England. On her return voyage, she almost fell into his hands a second time, but at last she reached Saint John again in safety. In April 1645 D'Aulnay besieged her here, while La Tour was in Boston. After a gallant defense, the fort was taken by treachery. D'Aulnay, to his everlasting shame, broke the terms of surrender, hanged the garrison and forced Madame La Tour to witness the death-struggles of her faithful soldiers, with a rope about her neck. Three weeks later, the heroine died of a broken heart. La Tour became a wanderer on the face of the earth, exploring and border-fighting in New France, while his rival ruled his province unchecked and built it up with a strong hand until he was drowned in the Annapolis River in 1650. La Tour hastened to France, confuted the old charges against him and obtained his former possessions in Acadie. Returning he married the widow of D'Aulnay and seemed about to enjoy a period of prosperity, when the province was once more taken by a Cromwellian fleet, in 1654. Undismayed by the sudden change of fortune, La Tour sailed for England and secured a joint grant of the territory with two English colonels, Crowne and Temple, to whom he soon sold out his interests. At the Restoration, he was made a baronet of Nova Scotia, and closed his chequered and adventurous career in 1672.

In 1667 Acadie was again restored to France by the treaty of Breda. The story of the French administration is not a pleasant one. It is a tale of incompetence, corruption, pettiness, and is told at length in the pages of Parkman. The priests accuse the officials, the officials accuse the priests. The luckless colony was raided time and again by pirates, and by expeditions from New England to avenge the Haverhill and Deerfield massacres. Canada could only be reached by long and dangerous traverse of the wilderness, but Acadie was only a few days' sail from Boston.

French rule came to an end during Marlborough's wars. In September 1710 a force from Boston, chiefly of provincial troops, under Col. Francis Nicholson, took Port Royal after a brief but gallant defense by Subercase. Port Royal at once became Annapolis Royal, in honor of the reigning sovereign, but it was not until 1713, by the Treaty of Utrecht (q.v.), and surely against the will of Louis XIV., that Acadie became finally a part of the British Empire.

From 1710 to 1749 a small British garrison at Annapolis Royal held the province tenaciously for England. The fort, though well placed, and a Vauban plan, was ruinous; the earthen walls were always crumbling into breaches; the gun-carriages would not bear the guns; the barracks were roofless; for years the men were without bedding, stockings, great-

coats or medicines. Supply-ships from England came once a year and brought provisions for nine months instead of twelve. The hostile population would not take New England money for their corn and cattle; the home authorities would not honor the governor's drafts; the Boston merchants refused credit. During Walpole's long peace England seemed to forget the lonely garrison, while the French priests were agents of the French government, undermining English authority. From 1720 on, Louisbourg, the new French city on the island of Cape Breton, was yearly growing in power, millions of livres were spent on its defences, for France was bound to win back her lost province. All the time, convinced of its importance to the empire, one discouraged English governor after another held doggedly to his post.

The government was military, not civil, for the Acadians being Roman Catholics were, by the laws of England, incapable of voting; but at least one official regretted that they could not be given representation. They were governed by their deputies, the "ancientest" and most reputable men of each parish, chosen every year on or about 11 October. These were responsible for the good behavior of their districts and for the execution of orders transmitted by the governor-in-council. Philipps, colonel of the 20th regiment, was governor for almost this entire period. He visited the province twice, but resided mainly in London, while lieutenant-governors, chiefly regimental officers, Armstrong, Cosby, Mascarene, administered the colony. The governor was supreme; but to assist him, he had a small council, whose functions were advisory and executive. These officials did their best to advance British interests, giving the litigious Acadians justice in their endless disputes, and making wise suggestions for the improvement of the colony, which must have been doomed to gather dust in the Duke of Newcastle's closet of unopened despatches.

On the outbreak of the war of the Spanish Succession (see SUCCESSION WARS) the men of Massachusetts rose and by splendid audacity struck down the stronghold of French power, Louisbourg; but that glorious adventure belongs to the annals of New England rather than of Nova Scotia. In the summer of 1744, gallant old Mascarene sustained two hot sieges in his ramshackle fort of Annapolis Royal; the first force was led by young Belleisle and other Acadians; the second, by Du Vivier, a descendant of Charles de la Tour. In 1746, Ramezay encamped against him, awaiting D'Anville's armada, but did not fight. The same winter, he surprised Noble's force at Grand Pré, and killed, wounded, or took prisoner nearly 200 men.

When the war ended by the treaty of Aix-la-Chapelle in 1748, Cape Breton was restored to France, and Louisbourg, the Dunkirk of America, resumed its old attitude of menace to the very life of the English colonies. Then at last, sluggish England moved to save the key to her possessions over-sea. Nova Scotia was to have an effective garrison to counter-check Louisbourg. In June 1749 a fleet of 13 transports, bearing some 3,000 colonists, and escorted by the sloop-of-war Sphinx, reached the great three-fold harbor of Chebucto, long known for its excellence to French and English mariners. The leader of the expedition was Col. Edward Cornwallis, twin brother of the gay Archibop

CANADA—THE MARITIME PROVINCES TO CONFEDERATION

of Canterbury, and uncle of the Lord Cornwallis, who surrendered at Yorktown. He had seen service at Fontenoy and Preston Pans, and although his military reputation was afterwards clouded by his share in the Rochefort and Minorca fiascos, he did his work as a city-builder well. The new military post, Halifax (q.v.), was quickly laid out, the land cleared, the population organized into a militia and a rough line of stockade and block-house run round the streets of tents and log-huts. In spite of the character of the settlers, trade-fallen soldiers and sailors, and the plague that carried them off in hundreds; in spite of Indian massacres, opposition from local smugglers, extortions of Boston merchants, discouragements from the home government, Cornwallis made Halifax a place on the map of the world. The founding of Halifax brought about the second capture of Louisbourg, leaving the way free for Quebec (q.v.) and the downfall of French power in America. Emigrants from Old and New England flocked to the new city. In 1750 and again in 1752, some hundreds of settlers came from the Palatinate. After a brief stay in Halifax, they were transferred to the island-studded bay of the La Héve, the old headquarters of de Razilly, where they have grown into a race of hardy fishermen, whose town, Lunenburg, is the Gloucester of Canada.

In 1752, Cornwallis returned to England crippled by rheumatism, but his successors, Hopson and Lawrence, built strongly on the foundation he had laid. Their great problem was the growth of French power in the fortress of Louisbourg and in the Acadian population. Under English rule, the *habitants* were far happier than under their old masters. The nominal government at Annapolis Royal had been powerless for good or evil. Its authority did not extend beyond a cannon-shot from the walls of Fort Anne. It was precisely under English rule that the Acadians increased and multiplied and, beginning to press upon the means of subsistence, spread outward, round the Bay of Fundy to the marsh-lands on the further shore. Their law-suits were nearly always over disputed lands, or boundaries. In 1755, they numbered about 10,000 persons. England and France were then mustering all their forces for the coming struggle known to history as the Seven Years War. No one could foretell that it would be final or which country would win. England seemed to be at the lowest ebb of fortune and spirit. Brown's lugubrious *Estimate* predicted her immediate downfall. France seemed strong in the New World; she had hemmed the disunited English colonies in with a chain of posts from the mouth of the Mississippi to Louisbourg. She had never ceased to regret the loss of Acadie or to plan for its recovery. The province was the pivot of the whole situation in the east. In these circumstances, the presence of the alien French population in it constituted a grave danger. The claim has been set up that they were neutrals; they had this idea themselves; but this strange notion was simply due to the impotence of the British government. They were no more neutrals than the people of Alsace and Lorraine were after their transfer to Germany in 1871. They were British subjects by conquest, by treaty, by the formal taking of an oath of allegiance and by the common law of nations, but they refused to consider themselves as such.

They might be French subjects again by another war, or the return of the Pretender. Whether they left the province or remained in it was not a matter of indifference. If they stayed, they afforded a shield to hostile operations; if they were free to go, they would strengthen and feed the garrison of Louisbourg. In this dilemma, the old proposal of Shirley's was renewed, their deportation. In the autumn of 1755, after Braddock's defeat gave the signal for war, this was done. The idea originated in New England and was carried out by New England men, acting under the orders of Gov. Lawrence. At Grand Pré, Pisiquid, Chignecto, and Annapolis Royal, the men were called together and made prisoners, and placed on board the transports; their families followed them. The embarkation consumed long weeks. Finally the ships sailed and distributed the unhappy people among the Atlantic colonies. In all, some 7,000 persons were in this way removed from the province. Opinions differ as to the measure. The French theory is the natural brutality of the English; one writer finds his reason for it in the greed of Lawrence to seize on the belongings of the poor peasantry. The general English view is that it was a war measure, cruel as all war is, but imperative for self-preservation; and this theory has the support of Parkman.

With the deportation of the Acadians came peace with the Indians. In 1761, Argimooish, "the great witch," and his braves buried the hatchet in Halifax and washed the war paint from their bodies. Now for the first time, settlers were safe outside the pickets of the city; and the country began to fill up. Emigrants from Connecticut occupied the waste lands of the Acadians. Highlanders from Caithness and the Western Isles settled about Pictou harbor. Presbyterians from the north of Ireland found homes in Colchester. Before and after the Revolutionary War, thousands of devoted Loyalists came to the province, some to remain, some to pass on. Shelburne, a city of these exiles, numbering 10,000 at one time, passed away like a gipsy encampment. The long wars of peace began with countless inroads upon the wilderness. In a century the Acadians had scarcely cleared 300 acres. Now farms and settlements were eating into the forest, and hamlets were springing up beside the empty harbors. Before the end of the century, the great industries of shipbuilding and the fishery were in their vigorous infancy. The American Revolution left few marks on the history of the province: efforts were made to bring the colony into revolt with the rest; one daring man planned the capture of Halifax, and some sympathizers with the rebels were tried for treason. There was even something like a tea riot in Halifax; but the conservative forces held the province firm. Halifax prospered, as it always did in war-times, through supplying the army and navy, and the sale of the many prizes brought to port. With the return of peace, the tide of prosperity promptly ebbed. In three great wars since its founding, Halifax was a nest of privateers, which brought large returns to their owners.

Colonial government was at first military. All power was vested in one man, the governor, or his lieutenant-governor, who was usually a soldier. To advise him, he had a council, and his instructions contemplated a legislative as-

CANADA—THE MARITIME PROVINCES TO CONFEDERATION

sembly. As the Acadians were incapable of representative institutions, they were governed through their deputies. Members of the old council were sworn into the new one by Cornwallis, when Halifax became the seat of government. His large instructions empowered him to summon assemblies and make laws; but the first Assembly was not elected until 1758. From this time, the chief power passed from the governor to the council, a small coterie of Halifax officials and merchants, appointed for life, who sat in secret session and were not responsible to the people. The powers of the Assembly were curiously limited, and friction between the two bodies was constant. Governor succeeded governor, almost always an army officer with high Tory views of prerogative and military conceptions of his office. He was gently guided through his unfamiliar civic part by permanent officials in the council like Richard Bulkeley, who came out as aide to Cornwallis and died provincial secretary in 1800. The tone of society as well as government was conservative, not to say reactionary. This state of things lasted until well into the fourth decade of the 19th century. With its large military and naval population, and the merchants who lived by supplying them, Halifax was in many respects an English garrison town in America. In the first session of the House of Assembly, the Church of England was established by law; the first college was modeled on Oxford, and its statutes required subscription to the Thirty-nine Articles both at matriculation and on taking a degree.

The agitation for reform began outside, for the country was pitted against the city. Jotham Blanchard, editor of the 'Colonial Patriot,' was perhaps the first critic of the existing order. The Rev. T. McCulloch, the Scottish 'Seceder' missionary, who founded Picton Academy and became the first president of Dalhousie College (q.v.), was another early reformer. But the man who brought reform to pass was Joseph Howe (q.v.), Nova Scotia's darling son, perhaps the most interesting personality in Canadian history. He was born at Halifax in 1806 of Loyalist stock. His father was king's printer, and, after some scanty schooling, he was apprenticed to his father's trade. In 1835 he was editor and owner of the 'Nova Scotian' newspaper. On New Year's day it contained a letter signed 'The People,' accusing the Halifax magistrates, in plain terms, of pocketing public money. Their indignation was extreme and they began a libel suit against the daring editor. If truth is libel, Howe had no case; and no lawyer would undertake it. Howe conducted his own defense, and by a brilliant address to the jury secured a triumphant acquittal. From that hour he was the idol of the people, whose cause he had espoused. On the other hand, several hot upholders of the existing order challenged him; he fought one duel, and, having proved his courage, wisely declined further argument by pistol. Howe was a good example of the popular tribune, emotional, eloquent, social, with the faults of such a nature, but possessing tact withal and the statesman's insight into great problems far beyond the ken of provincial politicians. On such questions as the union of the remaining British American colonies, communication between them, the federation of the empire, Howe was far in advance of his time, and his ideas were formative.

Henceforth, his career was in politics, rather than in journalism. Elected member for Halifax in 1836, he at once attacked existing abuses in a series of resolutions, which served chiefly as a programme of reform. Soon afterward he began an important correspondence with Lord John Russell, the colonial secretary, on the difficulties of local government. As a result, the latter instructed Sir Colin Campbell, the governor, to introduce certain of the changes suggested by Howe. This Sir Colin refused to do, and Howe began an agitation which led to his recall. He was succeeded by Lord Falkland, whose remedy for the trouble was coalition in the council. Four of the old council were dismissed, and four Liberals, Howe among them, took their place. But the two interests were irreconcilable: Howe and his friends soon resigned, and began to lay before the people the evils of the irresponsible system. In the election of 1847 Howe and his party swept the country. The new Assembly passed a vote of want of confidence in the council, which thereupon resigned in disgust. A cabinet was formed of the triumphant liberals and the principle of responsible government was established.

The situation of the colonies remaining to Britain on this continent, in the first half of the 19th century was not cheering. Upper Canada was largely uncleared forest, with struggling towns and widening clearings: Lower Canada was alien in speech and religion; both passed through the throes of rebellion. The great West was supposed to be uninhabitable. The Provinces by the sea were poor, thinly settled, each with its own government and its own tariff wall against the rest. The 20th century dawns on a united and prosperous country stretching from the Atlantic to the Pacific. For years Howe pointed out the value of union, for the object lesson of the Great Republic was hard to mistake. But here, as in the case of the Thirteen Colonies, before and after they achieved their independence, each province had its own pride, interests, and jealousies. Besides these, the geographical barriers to union seemed insurmountable; but the locomotive engine changed the face of affairs and provided the solution of the problem. The universal fever for building railways reached the Provinces. The first railway in Nova Scotia united Windsor, Halifax, and Truro: the first in New Brunswick, Saint John and Shediac. A bolder idea was to join the provinces, inland and seaboard, by an inter-colonial railway. If united for commerce, why should not the colonies be united for government?

It cannot be said that anywhere in the Maritime Provinces was there a popular movement in favor of union. It was the thought of a few strong, far-seeing men, with powers of persuasion, like Macdonald in the West and Howe in the East. Nova Scotia has the honor of leadership in bringing about the Charlottetown conference. When the question came up in 1867, Howe was in opposition, and Tupper carried the resolution through the House. By a curious irony of fate, Howe was now led to combat the very measures he had fought for so long. He took advantage of his opponent's failure to submit such an important measure to the verdict of a popular election and he roused the people into fury against confederation. They were bought and sold, he told them, 'for 80 cents a head, the

CANADA—THE MARITIME PROVINCES TO CONFEDERATION

price of a sheepskin." In the next election, the great issue was repeal of the union, Howe carried the country, and Tupper was the only Conservative returned. Howe tried every legal means to detach his province from the union, but the British Government refused to reconsider the measure it had just sanctioned, and Howe would not appeal to Washington, or have recourse to arms. He sought "better terms" for his province from the Dominion Government, and entered the Macdonald ministry to assist in working out the problems of the new experiment in government. Though not a consistent, Howe was a great man; with all his faults, he loved Nova Scotia well, and Nova Scotia will long cherish his memory.

New Brunswick.—The waterway of the Saint John as a great Indian road, attracted the attention of the French fur traders early in the 17th century. La Tour fixed his headquarters at its mouth. It is still the main artery of the Province. There were also French settlements on the rivers and harbors, such as the Miramichi, the Restigouche, Baie Verte. Petite Rochelle was partly fortified; the town at Beaubair's Point had 200 houses and a chapel. These settlements were not permanent. There was a small colony from Massachusetts at Maugerville on the Saint John in 1760; but the history of New Brunswick as a political unity begins with the close of the American Revolutionary War.

In some respects, the struggle of the Thirteen Colonies for independence was a civil war: for all the colonists were not of the same mind. Some of the best regiments on the King's side were raised in America. For instance, Fanning, the second governor of Prince Edward Island, at one time Judge of the Supreme Court of North Carolina, raised and commanded "The King's American Regiment." When the British cause was lost, such forces were disbanded, and the citizen soldiers, impoverished by eight years of war, could not or would not live under the new government. Many of the official class, the Episcopal clergy and their humble followers were also on the losing side. For the defeated, there was no mercy; the fierce republicans would not let them live in the country. After the surrender at Yorktown (q.v.) thousands of these unfortunates flocked to New York and other seaports. No provision was made for them in the terms of peace; but public sympathy was aroused on their behalf, the British Parliament took generous measures for their relief, Sir Guy Carleton stood their friend. Ships were provided to carry them away, large grants of land were made to them in the loyal colonies, with tools, supplies and provisions for one, two, or three years. Some went to England, but the great majority found homes in the northern wildernesses. There some thirty thousand exiles, many of the educated and cultured classes, found refuge. In American history these are the Tories, traitors to their country; in Canadian history, they are the United Empire Loyalists, the makers of the new Dominion. More than any other class of emigrants, they formed present Canadian sentiment and institutions.

The great emigration took place in 1783. On 18 May a fleet of 19 transports, with some 3,000 Loyalists on board, reached the mouth of the Saint John. Here a great stream of 450 miles pours through a narrow breach in the rocks into a small harbor, where the flood-tide rises 26 feet.

and ebb leaves the great ships aground. All round are desolate hills masking the fertile region beyond. This unpromising site the Loyalists chose for their city. They were men of the 8th, 98th, 194th Regiments, the New Jersey Volunteers, and the Queen's Rangers. The grantees' lists show good substantial English names. The "fall fleet" brought 1,200 more, and Parrtown, so called in honor of Gov. Parr, of Nova Scotia, began its career with a population of 5,000. Politically, it was situated in Sunbury County, Nova Scotia. Soon the Loyalists showed active discontent at Gov. Parr's delay in making out their grants, and in giving them representation in the House of Assembly, and, in spite of his opposition, they succeeded in persuading the British government to erect their county into a separate province with a royal governor, council and House of Assembly of their own. This was done in 1784, and the province of New Brunswick was created by royal charter, with Col. Thomas Carleton, brother of the famous Sir Guy Carleton (q.v.) for governor. His commission and instructions were practically the same as those given to Cornwallis in 1749. This council of 12 members exercised both executive and legislative functions. The first House of Assembly, of 26 members, was elected, not without riot, in 1785, and met for the first time in the following January. In this year, Parrtown was incorporated as Saint John (q.v.); it was the first city in British America to receive a charter. It is modelled on the charter of New York, and gives the Mayor the office of garbling spices and the right to appoint the bearer of the great beam. No emigrant or other person could sell goods without first obtaining the freedom of the city. From the founding of the province until 1832, no changes were made in the constitution. As in Nova Scotia, the prevailing ideas were high Tory; and popular rights received little attention.

New Brunswick's chief wealth is her great forests; and her two chief industries, lumbering and ship-building, soon sprang up: but agriculture languished. Population followed the waterways, the natural timber roads from the interior. Down to the time of the Crimean War, the timber trade was fostered by British legislation. The province grew, but not steadily; periods of prosperity were followed by periods of depression. Many emigrants brought out by the timber-ships simply passed through to the United States. The Reciprocity Treaty of 1852 was a boon to the Maritime Provinces: its abrogation injured trade.

During the War of 1812, the provinces were harried by privateers; but they were not invaded, like Upper Canada, because New England was opposed to the war. In the provincial sea-ports privateering also thrived. Dalhousie College was founded with customs money taken at Castine by an expedition from Halifax. After 1815, settlers from the United States began to occupy disputed territory between New Brunswick and Maine. The boundary between the two, left vague by the treaty of 1783 almost led to war. The northwest line was to run due north from the source of the Saint Croix River to the height of land between the Saint Lawrence and the Atlantic. Instead of one chain of high lands, there are two chains: between them lay the disputed territory, comprising some

CANADA — THE MARITIME PROVINCES TO CONFEDERATION

12,000 square miles. Under the Jay treaty of 1794, a commission was appointed to determine the line. The Americans wished to extend the due-north line to the Métis River in Quebec; the British wished to make Mars Hill the limit, and they could not agree. Another attempt at settlement was made by the Treaty of Ghent. The King of the Netherlands was appointed arbitrator, but his award was not accepted. In 1839, the difficulty became acute. Some lumber-thieves cut timber on the debatable land; the Governor of Maine sent a sheriff and posse to drive them out, and New Brunswick lumbermen resisted the officers of the law. The squabble roused intense feeling on both sides. The governor of Maine called for 10,000 troops to guard the State's rights. The governor of New Brunswick, Sir John Harvey, sent two line regiments with artillery and volunteers to the scene of action. Nova Scotia voted all her militia and £100,000 to aid the sister colony; the Canadas also proffered help. Gen. Winfield Scott took command of the American forces. He and Sir John Harvey had fought against each other in the War of 1812. They agreed to a joint occupation of the disputed territory; and the war-cloud blew by. In 1842, Mr. Baring for England, and Webster for the United States, negotiated a treaty that at last delimited the frontier. Of the disputed territory, Maine got 7,000 and New Brunswick 5,000 square miles. Mr. Baring was made Lord Ashburton for his success, and the treaty is known by his title.

One peculiarity of the colonial status was the appointment of colonial officials by the home government. New Brunswick's case is typical. The Governor, the Attorney General, the Provincial Secretary, the Judiciary, the Customs and Crown land officials were all appointed from England and paid out of the revenues arising from the customs and Crown lands. In 1825, the Legislature was given control of the customs, when it soon discovered that nearly all the revenue went out in salaries. Not until 1848 did the province both receive the revenues and fix the salaries of this department. In 1837, the province took over the revenue arising from the Crown lands on condition of paying the Governor, the Judiciary and the other government officials. The last department to come under provincial control was the Post Office.

As in other colonies, the irresponsible Council became an abuse, and many were the contests between it and the Assembly. In 1832, a second Council was established with executive, but not legislative functions. This was done by the home government in its desire for uniformity in the colonial governments; but the parliamentary principle of majority rule with an executive council or cabinet to carry out the will of the majority were slow in being understood. It was six years later before the executive included a member of the elected Assembly. Slowly the province worked out the problem of self-government. In 1839, when Sir John Harvey read to his Legislature, Lord John Russell's despatch on tenure of office, and unlike the Governor of Nova Scotia was in accord with its proposals, the Assembly, after full debate, actually refused the boon of responsible government. In 1848, however, the modern system was in essential particulars recognized by formal resolution. Charles Fisher, and L. A. Wilmot, afterwards Judge and Lieutenant-Governor, were the lead-

ing Reformers, and two of the royal Governors, Sir Howard Douglas and Sir John Harvey, were in complete sympathy with the popular movement.

New Brunswick was represented at the Charlottetown Conference, where the preliminaries of Confederation were discussed. At the Quebec Conference, the leading men of the opposition as well as of the party in power were delegates. The Seventy-two Resolutions then agreed upon were to be submitted to the various Legislatures for their approval. Before the New Brunswick Assembly could vote on them, it was dissolved; and in the new House, a large majority were pledged to oppose them. This led Nova Scotia to withhold the Resolutions, as no vital union could be effected with the upper provinces that left out New Brunswick. However, when the House opened in 1866, the majority committed themselves to the policy of union in the speech from the throne. The House dissolved on the issue, and, sentiment having changed, in the new election, the unionists were returned by a large majority. New Brunswick is one of the four original members of Confederation. See CANADA — CONFEDERATION; NEW BRUNSWICK.

Prince Edward Island.—The large crescent-shaped island in the southern part of the Gulf of St. Lawrence is supposed to have been discovered by Cabot, and afterward by Cartier, who named it Isle Saint Jean. After the conquest, it was still called Saint John's Island until 1780, when the local legislature named it New Ireland, an act disallowed by the British Government. In 1794, it was re-named Prince Edward's Island in compliment to the Duke of Kent, the father of Queen Victoria. After the treaty of Utrecht, Acadians from the main land settled at the southern central harbor and named it Port La Joie, the present Charlottetown. It was governed from Louisbourg. In 1752 the population was 1,354. Three years later, after the fall of Beausejour and the expulsion of the Acadians, many took refuge there. At the fall of Louisbourg in 1758, the population was at least 4,000 souls, in four thriving parishes. The fertile "Garden of the Gulf," as the islanders love to call their little sea-girt province, was even then worthy of the name. Casgrain calls it a second Acadie: for hence also the Acadians were expelled. When Capt. Holland made his survey in 1764, he found only 30 Acadian families "on the footing of prisoners," and a tiny British garrison in a miserable fort.

In 1763, the year of its cession to England, Lord Egmont proposed a plan of settlement worthy of Sir William Alexander in its feudal character. One feature was a chain of baronial castles from one end of the island to the other; but the plan was never carried out. In 1767, the entire island was divided into 67 lots or townships, of some 20,000 acres each, and granted, by lot, in one day to a number of influential Englishmen, on the old condition of settling so many emigrants within a certain time; they were to pay a perpetual quit-rent, or land-tax. Here began the curse of the absentee landlord, which laid the island under a blight for more than a century. At first, it was annexed to the government of Nova Scotia, but in 1768 it was, on the petition of a majority of the proprietors, erected into a separate province. In 1770, the first royal Governor, Col. Patterson,

CANADA—THE MARITIME PROVINCES TO CONFEDERATION

arrived with his official staff, whose salaries were to be paid from the quit-rents. The formative ideas here were also high Tory. Roman Catholics were not permitted to settle; no schoolmaster from England might teach without a license from the Bishop of London. Population grew slowly; for few of the proprietors fulfilled the conditions on which they got the land. In 1773, the first House of Assembly was elected. Its first act was to confirm all the past proceedings of the Governor and the Council.

On the outbreak of the Revolutionary War, two American vessels, sent to cruise in the Gulf for British ordnance store ships, raided Charlottetown and carried away some prominent officials. For this Washington cashiered the delinquent officers and released the prisoners with expressions of regret. Another raiding expedition from Machias came to nothing, and the island remained free from molestation till the close of the war. In 1781, proceedings were begun in the Supreme Court against the townships in arrears with quit-rents, and various holdings were escheated and sold, it was thought, without due notice to the landholders. The unimproved waste land was an obstacle to colonization; the owners neither planted settlers nor paid the quit-rents, on which the revenue depended. The landlords argued for the defense, that some of them were officers on active service, that the war had prevented settlement, and that the lands were sold to persons on the ground at absurdly low prices. In rebuttal, Patterson urged that in the midst of a disastrous war, both money and purchasers were scarce; the Island might have been captured or ceded back to France. He admitted that he bought up escheated land, but held he was within his rights as a citizen in doing so; he had also, at his own risk, saved out of the sales, various lots for the absentee owners. In response to various petitions from the proprietors, the home government granted them relief, and sent a draft bill to Gov. Patterson, making the sales voidable. This he was to submit to the Assembly, but he suppressed it for two years. A new Assembly was elected in 1784. It resolved to complain to the King against the governor for disposing of the lands so hastily, when he dissolved it.

The war was now over; the exiled Loyalists were pouring into Nova Scotia, and Patterson hoped to divert the desirable stream of emigration into his own province. Many Loyalists came; by special favors he secured them to his interest, settled some of them on the lands sold in 1781, and in 1785, secured an Assembly certain to support him. It passed an act approving his conduct in escheating the unimproved estates, but the home government disallowed the act and recalled the disobedient official. In 1786, the governor submitted at last the English draft act, already mentioned, to the Assembly, which passed it with haste, as also another act of the Governor's framing restoring the escheated lands to the rightful owners, but saddling them with heavy expenses: this the home government disallowed and dismissed the members of the Council concerned in it.

The new Governor, Edmund Fanning (q.v.) arrived in November, but Patterson refused to vacate his office, and the winter was spent in the quarrels of these two kings of Brentford: but in the spring, Fanning was firmly established. The escheated lands remained in the

quiet possession of their purchasers, some of whom came to terms with the original grantees. Fanning was a native of New York, a graduate of Yale, and a D.C.L. of Oxford. Through the Revolutionary War, he commanded the King's American Regiment and was twice wounded. In his administration, the land question smouldered. The chivalrous Earl of Selkirk, who also planted settlements in Upper Canada and the Northwest, brought out, in 1803, 800 of the Clan Ronald Macdonalds and settled them about Point Prim.

Fanning was succeeded by Des Barres, a Swiss officer in the British service, famous for his surveys, his amours and his great age; he jumped over a settle when he was more than a hundred years old. His administration was uneventful, but not so that of his successor. Charles Douglas Smith, brother of the famous Sir Sidney, who foiled Napoleon at Acre, was a fine example of the old-fashioned high Tory royal governor. His first address to the Assembly, when it met in November 1813, was insolent and dictatorial. In the following January, he prorogued it and did not convene it again until 1817. Between this and 1820, the Legislature was three times assembled and dissolved, after short sessions, by this exponent of personal rule. His proceedings in regard to the quit-rents were also oppressive. In 1818, in opposition to the express commands of the home government, Smith enforced the payment of quit-rents in arrears. His action, however, the British government disallowed, and ordered part of the exactions to be refunded. Then, for three years, no attempt was made to collect the odious tax; in some instances, payment was refused by the Receiver-General. In 1823, another effort was made by the governor to enforce payment. The Gaelic-speaking Highlanders of King's County were required to pay dues that seemed obsolete, or give promissory notes at 10 days. In the depth of winter, they must haul their farm produce to Charlottetown and sell at a sacrifice to meet these demands. Without a legislature, the people petitioned High Sheriff MacGregor to call public meetings for the discussion of grievances. The gathering at Charlottetown drew up an address to the King, rehearsing a long list of charges against the Governor, and requesting his recall. Smith retorted by opening a libel suit in the Court of Chancery, over which he himself presided, against the committee on the King's address in Queen's County. His object was to prevent the petitions reaching England, but the custodian of them escaped to Nova Scotia. For merely publishing an account of the proceedings, the editor of the local paper was brought into the Court of Chancery for libel. When he revealed the names of the writers, they were admonished by the chancellor-governor in the vein of Judge Jefferies. This energetic ruler, who shook his fist at the Speaker of the Assembly and gave him three minutes by the watch to adjourn the House, was recalled in 1824, when he had brought his long-suffering province to the verge of rebellion.

Governor succeeded governor; the Island grew in population and prosperity: fisheries and husbandry thrived; but the land question was an open sore. It had now become complicated by the fact that the original proprietors had died and bequeathed, or had transferred their rights in the Island. In 1859 Sir Samuel Cunard

CANADA — CONFEDERATION

(q.v.), the Halifax merchant who founded the famous line of steamers bearing his name, proposed that the whole question be referred to a commission of three members, one to be appointed by the Crown, one by the Island Assembly, and one by the proprietors. To this all agreed. Howe was the nominee of the Assembly. The commission sat in the Colonial Building in Charlottetown, examined many witnesses, though not on oath, and heard counsel on behalf of both parties. They afterwards visited the shire towns and acquired a vast amount of information on the difficulties. Their report is dated 18 July 1861. It condemns the original method of granting the Island, commends the land purchase act, by which the Selkirk and Worrell estates had been acquired for the people, and considers some such system to be the solution of the vexatious problem. It recommends the British government to guarantee a loan of £100,000, which would enable the local government to enter the open market for the purpose of estates. But the home government refused the loan, and the landlords refused to be bound by the findings of the commission. The old difficulty remained until the Island came into the Confederation in 1873, when the Dominion government placed \$800,000 to the credit of the province for the purchase of estates, and the local legislature made the sale of estates, on evolution of commissioners compulsory.

Charlottetown was the scene of the historic conference of delegates from the maritime provinces to discuss union, when the representatives of the Canadas came knocking at the door, but the Islanders were not in favor of any change in their status. There was prejudice, the conception of a new nation was hard to grasp, and the main issue was befogged by parish politics. Although Islanders took part in the Quebec and London conferences also, the Island remained outside Confederation until 1873, when the crippling of the provincial means by extensive railroad building led the people to a reconsideration of the matter. The Dominion Government gave generous terms, and the little province while losing nothing of autonomy, entered into a larger national life. ARCHIBALD MACMECHAN,

Professor of English Literature, Dalhousie College, Halifax.

Canada — Confederation. In 1837 there took place two rebellions; one in Upper and British, the other in Lower and French, Canada, simultaneous, but almost unconnected, and scarcely united in sympathy, since the British Protestants of the upper province were by no means fraternally linked with the French of the lower. In Upper Canada the rebellion was a rising of a democratic party, including many of the most recent colonists and some from the United States, against the personal rule of the imperial governor and the domination of a political circle nicknamed the Family Compact, and consisting largely of U. E. Loyalists, which monopolized public offices and emoluments. Its leader was Lyon Mackenzie, a man honest and

right in his main aim, if responsible government is right, but wanting in wisdom and capacity as a leader. The object of the extreme wing was an independent republic or annexation to the United States. That of the less extreme wing was responsible government on the British model. The political crisis and the outbreak of civil war were brought on by the indiscretion of an inexperienced governor, Sir Francis Bond Head, who (1836-8) threw himself into the arms of the Family Compact and the Tory party. In Lower Canada the rebellion was a rising of the French, the conquered race, who formed the great majority, against the monopoly of office and power by the British and conquering race, exercised largely through a council appointed by the imperial governor. Its object was the assertion of French equality and right. It had been preceded by a series of angry controversies between the French patriots and the governor with his British councillors and the Colonial Office at their back. Both rebellions were quelled (1838) with ease and without much bloodshed; that in Upper Canada by the loyal militia, that in Lower Canada by the Queen's troops. There were few executions, but some of the leading insurgents were driven into exile. The constitution of Lower Canada was suspended, but that of Upper Canada was not.

The Liberal party in the mother country was now in the ascendant, having carried Parliamentary reform. It looked with sympathy on the struggle of the Canadians for free institutions. Lord Durham (q.v.), son-in-law of the Whig prime minister, Earl Grey, and though an aristocrat a strong Liberal, was sent out (1838) to study the situation. In a report of remarkable ability, which has been regarded almost as the gospel of colonial liberty, he decided in favor of extending to Canada responsible government on the British model, requiring the governor, instead of ruling personally, to be guided, like the British sovereign, by the advice of responsible ministers, who were to be designated by the choice of the people. The report at the same time recommended the reunion of the two provinces, a measure the sure result of which its author imagined to be the complete ascendancy of the more powerful race, the destined heir, in his opinion, of the whole North American continent.

Durham, having exceeded the limits of his power, and incurred censure by condemning some ex-rebels to banishment of his own authority, his mission was cut short (1838) but his main recommendations were carried into effect (1839). The provinces were re-united, the measure being carried in the lower province, the constitution of which had been suspended, by the fiat of the Crown: in the upper province, after some debate, by a vote of parliament. Responsible government was introduced. The governor was instructed thenceforth to be guided, like the British sovereign, by the advice of his ministers, who were to be responsible to the people.

In a despatch from Lord John Russell (q.v.) (5 Feb. 1841) the governor-general was instructed to call to his councils "those persons who, by their position and character, have obtained the general confidence and esteem of the inhabitants of the province," and "only to oppose the wishes of the Assembly when the honor of the Crown or the interest of the empire

CANADA — CONFEDERATION

is deeply concerned.⁹ There soon followed a general amnesty, with return of exiles, and Lyon Mackenzie sat in Parliament under the new régime.

About the same time, and by the action of the same general forces, including the ascendancy of the Liberal party in Great Britain, responsible government on the same model was introduced in the maritime provinces. In Nova Scotia the change was brought about largely by the eloquence of the patriot leader Joseph Howe (q.v.) (1838).

The transition was smoothed by the wisdom of the new governor, Poulett Thompson, Lord Sydenham (1839-42), a man of business, trained in commercial life, who adapted himself steadily and with general success to the introduction and working of the new system. Sir Charles Bagot, who followed (1842-3), though a Conservative, took the same line. But the idea of colonial self-government had hardly taken root in the policy of the Colonial Office or in the minds of British statesmen. Sir Charles Metcalfe (1843-5), the next governor, had been trained in the imperial government of Hindustan, and brought with him the impression that in every dependency the governor was still personally supreme and responsible for the choice of his ministers and for their policy. Acting upon this principle, he attempted to form a ministry (1843) of his own without regard to party designation. A political storm, with furious pamphleteering and ministerial interregnum, were the results. The upshot was failure on the governor's part to form an effective ministry, and his consequent defeat. The colonial secretary, Lord Stanley, however, emphatically endorsed the governor's conduct, and was authorized with his own approbation to convey the personal approbation of the Queen.

The new system was finally installed and brought into order by Lord Elgin (q.v.) (1847-55), one of the best and wisest servants of the empire, who entered fully into the spirit of responsible government, contenting himself with the exercise of an informal influence, rendered important by his character and ability. He could even flatter himself that he did more in this way than he could have done with the formal powers of the governor. He came in, however, for the last of the storm. The Liberal party, now in power, passed an act called the Rebellion Losses Act (1849), indemnifying those who had suffered losses by the destruction of their property in the suppression of the rebellion. This the Tories regarded as the indemnification of the rebels. Their cry was taken up by the Tory party in Great Britain. Elgin gave his assent to the act, reluctantly it seems, in compliance with the rule which required him to be guided by the vote of Parliament and the advice of his responsible ministers. The Tories, now playing the part of insurgents in their turn, rose, burned the Parliament House at Montreal (1849), with its irreplaceable archives, and stoned the governor-general, who had a narrow escape from their fury. Elgin, however, remained firm and was supported by the home government. After this his reign, or rather his term, was peaceful and generally popular, though more popular with the Liberals than with the Tories. The triumph of the free trade policy in Great Britain, depriving Canada of her colonial privileges, while she remained fet-

tered by the Navigation Laws and was excluded from the market of the United States, bred commercial depression and discontent. The consequence was a manifesto signed by leading commercial men and pointing to union with the American republic as a remedy in the last resort. To put an end to this movement by removing its cause, Lord Elgin went to Washington and negotiated a reciprocity treaty with the United States (1854). This, following the repeal of the Navigation Acts and the release of the Canadian trade from the fetters which they imposed, restored prosperity, allayed discontent, and put an end to the desire of annexation. (See CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES.)

After the Rebellion Losses Bill, the most hotly debated of the political questions was that of the secularization of the clergy reserves (1854) (see CANADA — CLERGY RESERVES), tracts of land which, before the revolution of 1837, when the Church of England was established in Canada, had been set apart for the maintenance of the clergy of the state church. After a long struggle, secularization was carried, and the state church, with its privileges, ceased to exist. King's College, Toronto, which, so far as the teaching staff was concerned, had, like Oxford and Cambridge, been Anglican, was turned into the University of Toronto (see TORONTO, UNIVERSITY OF), and thrown entirely open to all denominations. Under Bishop Strachan, the powerful Anglican leader of the day, high Anglicans seceded from the University of Toronto and founded the University of Trinity College (1852). Other churches, during the continuance of the exclusion, had obtained charters for universities of their own, and dissipation of resources not more than sufficient, if collected, to maintain one great university, was the result.

The abolition of the seigniories (1854) in French Canada (see CANADA — SEIGNIORIAL TENURE), relics of the old Bourbon régime, with the oppressive privileges of the seignior, was another change obviously demanded by the new order of things. It was accomplished peacefully, without violation of the rights of property, and with entire success. Another necessary change was the abolition of the aristocratic custom of primogeniture in succession to land, for which was substituted the democratic principle of equal partition, "gavel-kind," as the movers called it. The Tory party, sympathizing with aristocracy, faintly resisted the change. The progress of democracy was further marked by a change in the constitution of the Legislative Council which formed the Upper House of Parliament. Instead of being nominated by the Crown, as it had hitherto been, it was in 1856 made elective.

The party system of government was now in full play, but the principles and relations of parties were far from being definite or stable. There was a Tory party representing the U. E. Loyalists, and the traditions of the Family Compact under the leadership of Sir Allan MacNab, who opposed the secularization of the clergy reserves and the abolition of primogeniture. There were on the other side moderate Liberals under Baldwin and more advanced Liberals under Hincks. But the lines of political party were crossed and perplexed by the nationality of French Quebec. The French Catholics,

CANADA — CONFEDERATION

instead of succumbing politically to British predominance as Durham had imagined that they would, closed their ranks, showed their force, played on the balance between the British parties, and put a Frenchman, in the person of La Fontaine, at the head of the government. For a time it became an understanding that a government, to hold its ground, must have a double majority; that is, a majority both in the British and the French province. The act of reunion had given to the provinces general representation in Parliament, though the population of the French province was much larger than that of the British. Presently the balance of population turned in favor of the British province. The Liberal leaders of the British province, the most pronounced of them at least, then demanded a rectification in its favor. With the political strife about representation by population, "Rep. by Pop.," as it was called, mingled the religious antagonism of the British Protestants of the upper province to the Roman Catholics of the lower. The great advocate of representation by population, and at the same time the extreme exponent of the feelings of the Protestants against the Catholics, was George Brown (q.v.), a Scotch Presbyterian, and founder of the *Toronto Globe*, the most powerful organ of the British Canadian press in those days. On the other side appeared Mr., afterward Sir, John Macdonald (q.v.), one remarkably gifted with the arts of party management, and with an address in dealing with men which in his chief antagonist, George Brown, was wanting. Macdonald supplanted in the leadership of his party the old-time Tory, Sir Allan MacNab (q.v.), Liberalized it, and set it free from all incumbrances in the way of reactionary principle by which, up to this time, it had been weighted in the struggle for place. It was a stroke of strategy something like that performed in England by Sir Robert Peel (q.v.) when, accepting the consequences of the Reform Bill, he changed his party from Tory to Conservative. Between Macdonald and Brown there was, and to the end continued there to be, enmity, personal as well as political. But Brown was no match for Macdonald in playing the party game. Once for a moment, by a casual defeat of the government of which his rival was a member, he set his foot on the steps of power (1858); but he immediately fell again, Sir Edmund Head, then governor-general (1855-61), having, by an unwonted exercise of the prerogative, which Brown furiously resented, refused him the dissolution and appeal to the country which he demanded (1858). Questions and principles of all kinds were crossed by personal ambitions and connections, as well as by the national sensibilities of Quebec, which naturally carried her to the side of the Conservatives rather than to that of the advocates of representation by population, the hot Protestants and the Orangemen.

The end, after a rapid succession of changes of ministry, producing a total instability of government, was a ministry with a majority so narrow that it was said that the life of the government depended on the success of a page in finding a member at the moment of critical division. The upshot was a deadlock. The relation between the two races, owing to the persistent attacks of George Brown's party on the French Catholics, had at the same time become critical and dangerous. From this position an

escape was sought by merging the antagonism of British and French Canada in a confederation of all the British colonies in North America. The credit of proposing confederation has been assigned to different politicians, to George Brown, to Sir John Macdonald, to Sir Alexander Galt. Of the party leaders, it was George Brown who first came forward holding out his hand to his rival, Sir John Macdonald, to propose coalition for the relief of the situation. But Mr. Brown's original proposal was not a confederation of all the provinces, but a substitution of a federal for the legislative union between the British and the French province. What Sir John Macdonald, as a strong Conservative and monarchist, preferred was not a federal but a legislative union of all the North American colonies under the British Crown. What all alike wanted was a relief from the situation, and for this purpose a coalition government comprehending the two rivals and enemies, Sir John Macdonald and George Brown, with followers of both, was formed (1864). The fact is that the real author of confederation, so far as British and French Canada was concerned, was deadlock.

The three maritime provinces, Nova Scotia, New Brunswick, and Prince Edward Island, were inclined to a separate union among themselves, especially with a view to a reduction of the expenses of government. A conference of delegates from those three maritime provinces was held at Charlottetown (1864). To that conference delegates were sent by the coalition government of Canada to propose a wider union. The result was a conference at Quebec (1865), at which 12 delegates were present from Canada, 7 from New Brunswick, 5 from Nova Scotia, 7 from Prince Edward Island, 2 from Newfoundland. That conference sat for 18 days and passed 72 resolutions, on which the act of union was afterward based and which each delegation undertook to submit to its own government.

By the Parliament of the two Canadas the scheme was at once accepted and by a large majority, though there was a long debate, in which a speaker of the opposition glanced at the geographical unfitness of the long and broken line of provinces for political union. New Brunswick, not being adroitly approached, at first rejected the scheme, but presently acquiesced. In Nova Scotia the resistance was very strong, but it still remains a mystery by what arguments a legislature elected expressly to oppose confederation was brought round to its support. Brought round, however, the legislature of Nova Scotia was. Howe, after a vain appeal to the British Parliament to set Nova Scotia free, himself took office in the confederation government. Prince Edward Island held out, but came in at last. British Columbia threatened repudiation of the union, till the construction of the Canadian Pacific Railway, which was the condition of her entrance, was assured. Newfoundland still remains unfederated. But a great addition was soon afterward made to the Dominion by the purchase of the Hudson's Bay country now comprising the province of Manitoba and the Northwest Territories. The accession of Newfoundland alone is wanted to complete the scheme of confederation. The scheme having been framed by the colonial legislature, was laid for revision before the British government, and

CANADA — SINCE CONFEDERATION

by it embodied in the British North American Act. (30 and 31 Vict. Cap. 3; 1867.)

When confederation was passed, party lines were drawn again. Brown seceded from the confederation government and the political enmity between him and Sir John Macdonald became as bitter as before.

The Federal constitution was never submitted, like the Constitution of the United States, to the people. It was alleged that in a general election which followed, and in which the confederation government was sustained, the people virtually expressed their approbation. But it is obvious to remark that in this election other issues were submitted and other influences, that of party especially, played their part. So that it cannot be truly said that the constitution of Canada has even been distinctly ratified by the Canadian people.

Canada — Since Confederation. On 1 July 1867 there were great rejoicings in Canada for it was the birthday of the new Dominion. But at that time the work of founding a Canadian nation was only begun; much remained to do. As it stood on 1 July 1867 the Dominion included only four provinces: Nova Scotia, New Brunswick, Quebec, and Ontario, (q.v.) and of these Nova Scotia was profoundly discontented and, since her people had never voted upon the question, desired to withdraw from the confederation. Nor did Canada possess the entire East. The two important islands, Newfoundland (q.v.) and Prince Edward Island (q.v.) still held aloof; not until 1873 was Prince Edward Island persuaded to join the Dominion, while Newfoundland still stands apart. The vast Northwest, to-day the chief pride and promise of Canada, was not then included within her territory, nor was its entry brought about without discontent and bloodshed. It had long been a hunting preserve for the Hudson Bay Company, but in 1870 by paying to the company £300,000 to extinguish its rights Canada removed every obstacle to her absorption of those regions. In 1871 British Columbia (q.v.) consented to enter the Union, but was long restless and threatened to withdraw unless a transcontinental railway was promptly built. With all these jarring elements assuredly Canada, when confederated, had no real union, and the subsequent work of her statesmen has been chiefly to consolidate her scattered fragments.

The leader who played the chief part in this work of consolidation was Sir John A. Macdonald (q.v.). In many ways, in wit, in intellectual agility, sometimes in cynical carelessness as to the means he used to secure his ends, he was strikingly like Lord Beaconsfield; but whenever the vital political interests of Canada were concerned, invariably, according to his light, he showed a whole-hearted patriotism. He was filled with passionate devotion to the British

Crown and treasured for Canada the ideal that she should be a kingdom modeled on that of Great Britain, taking her place on equal terms as an auxiliary of the United Kingdom. He did not favor federal government, and would have preferred to give Canada one all-powerful legislature like that of Great Britain. But in these respects conditions were too strong for Macdonald. His cherished "Kingdom of Canada" became the "Dominion of Canada" in deference to the supposed prejudices of the American republic against a monarchical neighbor, and he was obliged to assent to a federal system because the French in Canada insisted upon a measure of autonomy only to be secured in this way. It was the pending "Alabama" question that made Britain so anxious at this time to defer to the opinion of the United States. This and questions more directly affecting Canada were settled by the Treaty of Washington, 1871 (q.v.).

Macdonald was Prime Minister of Canada for the long period, 1867 to 1896, with the exception of an interval of about five years, lasting from November 1873 to October 1878. Inevitably he did the work of proving the federal system which he had helped to create. There was trouble from the first. When as a result of the bargain with the Hudson Bay Company Canada assumed jurisdiction in what is now Manitoba, some of the settlers already established there objected to being handed over like cattle to a new government. Surveyors sent in by Canada were turned back; officers going into the country to assert Canadian authority met with a like experience; and at last the half-breed inhabitants under their leader, Louis Riel (q.v.), set up a provisional government at Fort Garry, now Winnipeg (q.v.), and defied the Government of Canada. They tried and summarily executed Thomas Scott, a citizen who opposed their proceedings, and they threw other leaders into prison. See RIEL REBELLION.

In 1870 it was not easy for Canada to assert her authority in the remote settlements on the Red River. She might not use for military purposes the territory of the United States, which offered the most convenient route, and she was therefore obliged to send troops through the vast wilderness lying north of Lake Superior. The present Lord Wolseley, then holding a military command in Canada, was chosen to lead a small army to Fort Garry and did the work with brilliant success. After a toilsome journey through hundreds of miles of wild and barren country Wolseley at length reached Fort Garry only to find that Riel and his provisional Government had fled at the approach of the Canadian force. Rebellion crushed, the work of pacification was conducted partly with the aid of Mr. Donald A. Smith, now Lord Strathcona, an official of the Hudson Bay Company. Manitoba soon became a full-fledged province in the Canadian federation and has since played an important part. In view of the present status of Winnipeg, the third city in Canada, with nearly 100,000 inhabitants, it is interesting to remember that it had not even the telegraph in 1870 and that the railway did not reach the town until 1878.

The trouble in Manitoba settled, Canada had next to pacify her remote Pacific Province, separated from her by an immense and almost unpeopled wilderness. In 1871 British Columbia

CANADA — SINCE CONFEDERATION

entered the confederation on the condition that a railway across the continent should be begun within two years and completed within ten. At the time the province contained but a few thousand people of European origin, and there were complaints in eastern Canada that the vast expenditure involved in the bargain would burden too heavily the country's resources. But, on pain of her withdrawal from the union, British Columbia insisted angrily that the bargain should be carried out, and her attitude brought to the front the building of the trans-continental line which was to prove of supreme moment to Canada.

That Canada's small population should spend a hundred million dollars on this undertaking was a stupendous proposal; on the basis of the proportionate cost for each head of population a project for the United States to spend \$2,000,000,000 would be its equivalent. But to build the railway was the condition of national existence in Canada, and in the end the thing was done. Not, however, before the project had long disturbed Canadian political life and threatened to overwhelm its promoters with ruin. When the Canadian Pacific Railway (q.v.) was projected Canada was face to face with the question that has perplexed all the progressive states of modern times. Should the railway be a government or a private enterprise? Though a similar line, the Inter-Colonial Railway, connecting the eastern provinces, was a state enterprise, the cabinet of Sir John Macdonald shrank from saddling the country with so vast a burden as a railway to the Pacific, and it was resolved to hand over the task to a private corporation.

In 1872 there was a general election in Canada, and in the session of Parliament which followed the Canadian Pacific Railway Company with Sir Hugh Allan as president, secured a charter to build the road, and with this went also assurances of assistance from Canada amounting to many millions. But when, as a result of the exposure by the Opposition, the fact came out that Sir Hugh Allan had contributed more than \$350,000 to Sir John Macdonald's campaign fund for the recent election, this "Pacific Scandal" brought the downfall of the Government, which had accepted the obvious bribe. Amidst huge excitement Sir John Macdonald resigned and the Liberals with Mr. Alexander Mackenzie (q.v.) as prime minister took office in November 1873.

For five years the Liberals remained in power. Throwing less energy into the construction of the Pacific Railway than had been promised, they met naturally with discontent in British Columbia. The menace of withdrawal from the confederation was renewed and at length the matter was referred for arbitration to Lord Carnarvon, the colonial secretary, in London. He decided that the original terms were too onerous and proposed new ones under which a trans-continental railway should be opened by the end of the year 1890. When the Liberal Government thought even this almost impossible of accomplishment, "Carnarvon Terms or Separation" became the war cry in British Columbia. Financial depression overtook Canada in 1876-8 and this heightened the difficulty of the question. But in 1876 the Governor-General of Canada, the Earl of Dufferin, visited British Columbia to soothe her discontent, and he helped to tide over the period of danger. It is interesting to specu-

late whether an attempt to withdraw from the Canadian union would have been resisted, if necessary, by force of arms. Probably the Canadian and Imperial Governments would have agreed in using coercion.

The financial depression that helped to delay contentment for British Columbia produced effects in Canada even more far reaching, for it led to the cleavage of political parties on the question of Protection (q.v.) or Free Trade (q.v.). In 1878 Canada had a tariff of 17½ per cent, which was hardly sufficient for her growing revenue requirements. During a generation she had tried to secure a free exchange of natural products with the United States and in 1854 her governor, Lord Elgin, had succeeded in making a Reciprocity Treaty on this basis. But the Treaty was not long in force and when abrogated at the close of the Civil War a heavy tariff upon Canadian products was soon imposed by the United States. Over and over again Canada tried to secure the reversal of this policy but always in vain. Meanwhile the low Canadian tariff permitted American manufacturers to supply the Canadian market at prices with which the necessarily smaller producers in Canada could hardly compete, and in time the cry for increased Protection was often heard. Had Mr. MacKenzie's Government taken it up in 1878 probably Sir John Macdonald would have rallied his forces under the banner of Free Trade. But when the Liberal leader refused tenaciously to adopt Protection, Sir John Macdonald proclaimed it as a "National Policy" for building up Canada, and the Canadian electorate, forgetting the discredit which attached to him in connection with the Pacific scandal, returned him to power by an overwhelming majority. Since that time Protection has retained its hold upon Canada, for though the Liberals favored free trade they disturbed the system but slightly on their advent to power in 1896. See CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES.

An era of great expansion followed the adoption of a protective tariff in 1879. A great many factories were established, and the building of the Canadian Pacific Railway was pushed on with unparalleled energy; in 1885, five years before the time named in the contract, the last spike was driven in the line connecting Western and Eastern Canada and British Columbia's grounds for discontent were finally removed. Once completed the road's value not only to Canada but to Great Britain was soon apparent. Not only did it unite the Canadian provinces, it furnished a ready all-British land route to the East. The Canadian Pacific Railway Company in time established lines of steamers crossing both the Pacific and the Atlantic, and the project, looked upon as a doubtful possibility in 1878, has now become one of the chief arteries of world commerce.

The completion of the Canadian Pacific Railway was almost co-incidental with a second rebellion of half-breeds in the Canadian West. On the banks of the Saskatchewan, not far from a village called Prince Albert, there was a colony of these people. They had long lived remote from the larger world, and when their country was invaded by the pioneers of modern movement, they began to doubt whether they should be left in permanent possession of the lands they had long occupied. Upon these lands they were

CANADA — SINCE CONFEDERATION

technically "squatters" for they had no patents and no surveys had been made. When at length Canadian surveyors came to lay out their fields on a uniform plan, disregarding the divisions which they had established, the half breeds protested and demanded that they should be granted patents for their lands as they stood. At Ottawa their protests were filed but remained unheeded. The official mind was aghast at the prospect of land grants not based upon the usual survey; the half breeds could get nothing done and they grew ever more restless at the supposed menace to their rights. Disinterested observers sent to Ottawa warnings of a probable rising but official supineness was invincible, and the result of neglect and delay was that in March 1885 the despairing half breeds attacked a body of police, killed 12 out of 40 engaged, and defied the authority of Canada. Since it was not unlikely that they would be joined by the Indian tribes the outbreak was serious.

The half breed leader was the same Louis Riel (q.v.) who had caused trouble in 1870. On its hands the Government now had a difficult task. As in 1870 it might not send troops through the United States, and the railway on the north shore of Lake Superior connecting Eastern and Western Canada was not yet completed. In bitter March weather, with the thermometer often below zero, the regiments of militia summoned from Eastern Canada, all unprepared by previous hardship to endure the cold, traversed the desolate shores of that frozen region. Sometimes in open flat cars, for more than a hundred miles on foot, they proceeded over the snow. An experienced officer of the expedition declares that the task was more severe than Napoleon's passage of the Alps, for Napoleon had a beaten road and an abundant commissariat, while both were wanting in the Canadian wilderness. The regiments soon poured into the West in overwhelming force and though the few half breeds made a brave stand against great odds, they were quickly crushed. Their Indian allies the Canadian troops wearily followed to their almost trackless haunts, and so the Rebellion was put down. A few of the rebels were hanged; a good many of the Indians were imprisoned; Riel, the leader, was taken, and then his fate became a question of national concern in Canada.

With Riel the French Canadians had ties of faith and of blood. French Canadians had been pioneers in the Northwest and at times they had dreamed of holding that vast region for their language and faith. If fate was against them, if it was the Anglo-Saxon who was occupying the country and in influence was destined to dominate, none the less was chivalrous support due to the few people who stood in the West for the ideals of France and of the Roman Catholic Church. In 1870 Riel had appealed not in vain to the French in Quebec for help in his time of trouble and it was probably the strength of their sympathy which then saved him from the scaffold. Since in 1885 the men who took up arms had more real grievances the Church espoused their cause. In the Province of Quebec Liberals and Conservatives forgot their quarrels to protest in the name of justice and French Canadian nationality against rigorous treatment of the rebel leader, Louis Riel. On the other hand the English demanded that the law should take its course. Riel had led a revolt in which

law-abiding citizens were shot down. If he was a murderer the penalty of murder was his due. The demand was too urgent to be disregarded. Riel was tried; in the eye of the law the penalty of his crime was death, and in November 1885 he was hanged at Regina, the capital of the Northwest Territories. See **RIEL REBELLION**; see also **CANADA — JESUITS ESTATES ACT** for another religious and racial question in Canada in 1888-9.

The Government's course in regard to Riel was a defeat for the French Canadian Bishops who had long played an active part in political life. They claimed that even in secular affairs the authority of the bishops was final and that when they spoke the laity were bound to obey. If the Church chose to indicate her desires in regard to the merits of candidates seeking election, it was the duty of the voter to heed the voice of his spiritual directors. Some of the bishops claimed the right to use spiritual censures to influence electors. Newspapers who opposed the wishes of the hierarchy must not be read by the faithful, and when *L'Electeur*, a daily newspaper in Quebec, opposed the bishops' *Mandements* in 1896 it was denounced from the altar, and under penalty of grievous sin and the refusal of the sacraments all the bishops forbade formally anyone to read it, subscribe or contribute to it, to sell it, or in any manner whatever encourage it. The denunciation commanded obedience and made the continued existence of the paper under its existing name impossible. It promptly became *Le Soleil*, and seemed to suffer little real injury, but the incident showed the authority claimed and exercised by the bishops.

With this attitude on their part occasions of strife were not likely to be wanting. In 1890 the Manitoba Government passed an Act establishing a non-sectarian system of education. Owing to the peculiar conditions of older Canada the Protestant minority in the Province of Quebec had secured the constitutional right to devote the taxes paid by them for education in support of their own schools. In Ontario the Roman Catholic minority possessed a similar privilege. For some time Manitoba had followed the example of Ontario, but, impressed by the obvious advantages of a uniform system, the legislature passed the Act of 1890 which deprived Roman Catholics of former privileges. At once a vehement agitation broke out. The Federal Government possesses, within certain limits, the right of disallowing statutes enacted in the provinces and urgent demand was made upon the Government of Sir John Macdonald to disallow the Manitoba School Bill. This, on the ground that Manitoba was acting within its constitutional rights, the Government refused to do. Appeal was then made to the courts to determine the authority of the respective Governments in the matter and the case was finally carried to the Privy Council in London, which decided that the Federal Government possessed the right of intervention in regard to the Manitoba schools.

Extraordinary pressure was then brought to bear upon the Federal Government. The hierarchy of the Province of Quebec took up the question with much heat, while the Protestant Province of Ontario was also aroused in support of the opposite side. In 1891, when Sir John Macdonald died, his successors were left with the legacy of the Manitoba School Question.

CANADA — SINCE CONFEDERATION

The agitation dragged on for five or six years. Retreat from their position the Manitoba Government would not, and finally, in 1896, the Federal Government endeavored to put through Parliament a Remedial Bill for restoring to the Roman Catholics of Manitoba the privileges which had been taken away.

It was this question that brought the downfall of the Conservative party so long dominant in Canada, a process accelerated by evidence adduced in 1891 of a share by responsible leaders in the Province of Quebec in the misuse of public funds. In 1896 Sir Charles Tupper (q.v.) became Prime Minister and in a general election appealed to the country to do justice to the minority in Manitoba. On this question many of his Conservative allies broke away from him and he fought a stern but losing contest. The Liberals too were in a difficult position. When Sir John Macdonald's old rival, Mr. Alexander MacKenzie retired from the leadership of the party in 1880 he was succeeded by Mr. Edward Blake, who, in turn, proved unable to overthrow the Conservative chieftain. In 1887 Mr. Blake retired and was succeeded by Mr., afterwards Sir Wilfrid, Laurier. In personal charm and tact the new leader was not unlike his formidable rival, and he had, besides, remarkable gifts as an orator. French Canadian by birth and also a Roman Catholic, it was not easy for him to lead the Liberal party, which was committed unreservedly against interfering in Manitoba. In Mr. Laurier's own Province of Quebec the hierarchy were still unanimous in demanding intervention to re-establish the Roman Catholic schools. The election of 1896, fought chiefly on this issue, resulted in a conspicuous Liberal triumph and it was in Quebec that Mr. Laurier found his most striking support. Either the issue in regard to Manitoba had been obscured or the "*habitant*" wished to assert his right to pass judgment for himself in political matters independent of the views of the hierarchy. At any rate Mr. Laurier became prime minister of Canada. The Manitoba Government made some minor concessions and the matter passed out of view, but an important warning against interfering with the authority of the Province had been given to the Federal Government.

The Liberal party had long championed the cause of freer trade and declared itself the enemy of Protection; it was therefore committed to some modification of the existing Protective system. But, once in power, it found that, since important industries had grown up under the tariff, this could not be changed in any radical manner without ruin to those concerned. While doing something to reduce Protection the Government took a further remarkable step. The year 1897 saw the completion of 60 years under Queen Victoria's sovereignty, and there was a general desire to draw more closely together the different sections of the empire, and thus to assert British unity. In pursuit of this idea Mr. Laurier's government announced that a preference of 25 per cent (later increased to 33½ per cent) would henceforth be allowed to countries whose tariff gave a favorable opening to Canadian products. Since Britain alone gave such treatment the preference was confined to her, though other countries might share in it on the terms laid down. Both in England and in Canada the Preferential Tariff aroused great enthusiasm and no doubt it aided in bringing to a

head Mr. Chamberlain's scheme, announced a few years later, for a Preferential Tariff in the mother country for colonial products. See CANADA — BRITISH PREFERENTIAL TARIFF.

In 1898 the Liberal Government had a renewed opportunity to proclaim its devotion to British connection. When war broke out in South Africa and soon proved more serious than had been thought possible, Canada promptly volunteered to send military contingents in reinforcement of the British troops. The contingents saw some service and a good many Canadian soldiers lost their lives. Naturally the French Canadian showed less enthusiasm for what was in large degree a racial war than did the British element. Only a few French Canadians served in the contingents, and some voices protested against Canada's participating in British wars. But the overwhelming opinion of the country supported the rally to Britain's aid; when the Government appealed to the country in 1900 it gained an easy victory, partly upon this issue.

A little earlier the discovery of gold in remarkable quantities in the Yukon Territory, arousing as it did world-wide interest, naturally attracted attention to a part of Canada hitherto thought of little value. The possession by the United States of the adjacent coast of Alaska (q.v.) through which lay the best route to the new gold country, seriously impaired the value to Canada of the territory. The boundary between Alaska and Canada had long been the subject of dispute, the Canadians contending that since, under the terms of the determining treaty, the line should run from headland to headland, the land at the head of the inlets which furnished the most ready access to the Yukon were in reality British territory. Canada's cause was prejudiced by the fact that (though not without occasional protest) she had acquiesced in the American contention that the boundary line followed the sinuosities of the shore. A disputed boundary is always dangerous. Besides this question there were other matters requiring settlement between the United States and Canada, and at last, in 1898, a Joint High Commission, including prominent representatives of both the American and British side, was appointed and sat for some weeks at Quebec and then at Washington. In addition to the Alaska Boundary the Commission was, if possible, to agree upon a settlement of the differences in regard to the seal fishery in Behring Sea and the Atlantic fisheries; and besides minor matters was to consider the general trade relations between the two countries. Points of variance proving too great, the Commission effected nothing but in the end the two Governments agreed that six jurists of repute, three to represent each side should be appointed with authority finally to settle the Alaska Boundary. In the end a majority of the commissioners gave, in 1903, a decision favorable to the claims of the United States. Lord Alverstone, the British commissioner who supported the American contentions, was severely censured in Canada for an attitude that seemed more diplomatic than judicial, but in spite of a passing irritation there was general satisfaction that a troublesome issue had at last been settled. See ALASKAN BOUNDARY COMMISSION.

If the recent history of Canada has not been dramatic it shows none the less a record of great progress. For a long time the population of the

CANADA—THE CANADIAN WEST

country increased very slowly. While successive decennial censuses in the United States usually showed increases of about 25 per cent in the population, the increases in Canada were hardly 10 per cent. In recent years, however, an improvement is apparent. Population is increasing rapidly. While formerly there was extensive emigration from Canada to the United States there is now a considerable movement from the United States to Canada and a good many American farmers are occupying the wheat lands of the West. (See CANADA—SETTLEMENT OF THE CANADIAN WEST.) So striking is this Western development that in 1904, further to open up the western country, a second trans-continental line of railway, the Grand Trunk Pacific, was begun, and a third line, the Canada Northern, will probably be completed before many years. These railways will traverse regions far north of Canada's southern frontier, and by extending northward the cultivated area will help to remove from Canada the old reproach that she is "length without breadth." Canada now has confidence in herself to which she was long a stranger. The troublesome domestic issues which played the chief part in her history since Confederation are pretty well solved; the old racial cries are not often heard, and when uttered they usually bring political disaster to those raising them. See CANADA—CONFEDERATION; CANADA—RELATIONS TO GREAT BRITAIN.

GEORGE M. WRONG,

Professor of History, University of Toronto.

Canada—The Canadian West. It is doubtful if a British sovereign ever made a more munificent grant to a company of his subjects than did Charles II., in the year 1670, to "The Governor and Company of Adventurers of England trading into Hudson Bay." The sweeping terms of the royal charter defined an area stretching from Hudson Bay to the Rocky Mountains, to which was given the name of Rupert's Land, in honor of the king's cousin, Prince Rupert, the company's first governor. In spite of the hostility of the French Canadian government and the competition of rival traders, the Hudson's Bay Company succeeded in holding this territory down to the date of its cession to Canada two centuries later. Although a century had elapsed since Sir Francis Drake had sighted the snowy peaks of the Pacific coast, and half a century since the ill-fated Henry Hudson had discovered the bay which became at once his grave and the monument of his achievement, yet the history of the Canadian West may be said to date from the founding of the Hudson's Bay Company. See CANADA—THE HUDSON'S BAY COMPANY.

The presence of the English company upon the shores of Hudson Bay was from the outset a serious menace to French Canadian influence in the Northwest. The newcomers were drawing off the trade of the northern tribes. English and French were face to face in a struggle for commercial supremacy in the West, and their rivalry was bound sooner or later to break into a clash of arms. The Hudson's Bay Company had strengthened its position by the establishment of four trading-posts: one upon the west shore near the Nelson, and the other three, Forts Albany, Hayes, and Rupert, on the south arm of the bay. In the spring of 1686 the progress of trade was rudely interrupted. Chevalier de

Troyes and a company of 80 adventurous Frenchmen, ascending the Ottawa, worked their way slowly by stream and lake over the height of land to the neighborhood of James Bay. So sudden was their coming, and so spirited their attack, that the three lower forts fell almost without resistance.

In 1697 Pierre le Moynes D'Iberville, who had been De Troyes' right-hand man, entered Hudson Strait, under orders from Quebec, to attack Fort Nelson, the most important trading-post on the bay. The Pelican, which carried the commander, became separated from the rest of the fleet, and fell in with three English ships belonging to the Hudson's Bay Company. In the encounter which followed the Pelican sank one of the company's ships and disabled a second, while the third made off under full sail. Rejoined by his missing ships, D'Iberville soon forced Fort Nelson to surrender. In 1713 the Treaty of Utrecht put an end to hostilities and left the English traders in undisturbed possession of their posts.

Meanwhile French Canadian traders were extending their trade beyond Lake Superior. With these there was ever present the desire to find *La Mer de l'Ouest*, which they thought could not be far distant. The ambition to discover this "Western Sea" possessed the mind of Pierre Gaultier de Varennes de la Vérendrye, the commander of a little post on Lake Nepigon. It was late in August 1731 that Vérendrye and his party passed over Le Grand Portage leading over the height of land to the waters flowing toward Lake Winnipeg. The mouth of the Maurepas (Winnipeg) River had been reached when troubles began to crowd upon the unfortunate explorer. The merchants who were to forward supplies failed to do so; his nephew died; and, as a climax to his misfortunes, 21 of his company, including his eldest son, were butchered by a band of murderous Sioux. It was not until six years later that Vérendrye again turned his face westward. The course of his travels was marked by a series of trading-posts built at successive stages. Among these were Fort La Reine, near the site of the present town of Portage la Prairie, and Fort Rouge, whose name still clings to a suburb of the city of Winnipeg.

During the last century of the French régime the Hudson's Bay Company had held its own throughout the dangers of war and the competition of trade. Its forts had fallen into the hands of De Troyes or D'Iberville, but had been restored by the Treaty of Utrecht (q.v.). Though the dangers of war were past, the rivalry of the Canadian traders had still to be met. Despite the long overland journey, the latter penetrated to the neighborhood of Hudson Bay, attracting the Indians with showy trinkets, and too often with brandy. The majority of the natives, however, were not easily drawn away from the old company's forts. Every spring the rivers and lakes were dotted with fur-laden canoes making their way to Lake Winnipeg, the meeting place of the hundreds of natives who journeyed annually to Hudson Bay. As many as 500 canoes in a year made the long and toilsome journey to York Factory. Here they exchanged their dearly-earned furs for coats, blankets, kettles, and tobacco, or for necessities of the hunt, such as guns, powder, powder-horns, shot, hatchets, and knives.

CANADA—THE CANADIAN WEST

The conquest of Canada by Great Britain brought about an immediate and complete change in the fur trade. With the passing of the French régime, monopoly and licenses disappeared. The officers of the French company withdrew from the country rather than live under the British flag. The *coureurs de bois*, suddenly cast adrift, lacked the capital necessary to continue the fur trade. New employers, however, were soon at hand. The old route from the East, up the Ottawa and across Lake Superior to Grand Portage, had scarcely forgotten the passing of the French traders when it was traversed afresh by British merchants from Montreal. Alexander Henry, Thomas Curry, James Finlay, and the Frobisher brothers were the hardy forerunners of a new race of traders, whose enterprise and daring soon carried them into the Saskatchewan and Athabasca districts. In order to compete the more successfully with their long-established rivals, the newcomers, who at first traded individually, decided upon union, a decision which led to the founding in 1783 of the Northwest Company. Under the stimulus of competition the operations of both companies quickly extended northward to Lake Athabasca and westward to the foot-hills of the Rockies.

The necessity of enlarging the field of trade gave a remarkable impulse to exploration. In penetrating the unknown lands, north and west, the pioneer traders rendered invaluable service to their country. The honor of leading the way into the northland belongs to Samuel Hearne, a servant of the Hudson's Bay Company. Setting out from Prince of Wales Fort, Hearne succeeded, after two failures, in reaching the Coppermine River. He was the first white man to arrive at the Arctic shores from the interior. The men of the Northwest Company were not slow to follow the example of their rivals. No name holds a prouder place in the annals of American travel than that of Alexander Mackenzie. Fort Chipewyan, situated upon the shores of Lake Athabasca, the trade centre of the north, was the starting point of his two great journeys. The "Western Sea," the elusive goal of Vérendrye's travels, was the object of Mackenzie's quest. His first journey, made in 1789, terminated at the Arctic Ocean. Choosing a more westerly stream for his second attempt, Mackenzie ascended the Peace River to its source in the Rockies, crossed the height of land, and, after descending the Fraser River a short distance, struck out across country for the sea. The successful issue of the journey was proclaimed by the following words inscribed upon the face of a rock overlooking the waters of the Pacific: "Alexander Mackenzie from Canada by land, the twenty-second of July, one thousand seven hundred and ninety-three." Two other Nor'westers, Simon Fraser and David Thompson, also made their way to the Pacific Ocean, the former in 1808 by the river which bears his name, the latter in 1811 by the Columbia.

While British explorers were forcing a way across the continent, British seamen were making good their country's claim to the Pacific coast. In 1778 Captain Cook touched at Nootka, on Vancouver Island. At this centre of trade Captain John Meares 10 years later established a settlement, which unfortunately was soon destroyed by the Spaniards. In 1792 Captain

George Vancouver, being sent out to inquire into the action of the Spaniards, forced the latter to withdraw from the scene of their outrage. As the result of arbitration Great Britain received the entire coast line.

Down to the close of the 17th century the ruling interest of the West centred in the fur trade. Lord Selkirk it was who first conceived the idea of planting a settlement at the heart of the continent. From the Hudson's Bay Company he secured a grant of 110,000 square miles in the valley of the Red River, a district henceforth called Assiniboia. Settlers were hurried out from Scotland, and in 1812 a small company, 70 in number, made its way inland from York Factory.

The newcomers were looked upon as intruders by the Nor'westers, who suspected that Lord Selkirk, being a shareholder in the Hudson's Bay Company, had planted his colony to interfere with the trade of the Canadian company. The early years brought trying experiences to the settlers. So great was the scarcity of food that the governor, Miles Macdonell, issued a proclamation to the effect that "no provisions, flesh, fish, grain, or vegetables were to be taken out of the lands of the settlement for a year." This action brought the hostility of the Nor'westers to the point of violence. Some of the colonists were bribed to desert, the remainder were driven out by a band of Métis, or half-breeds. Almost immediately, however, the refugees returned, reinforced by another company of immigrants. With the new arrivals came Robert Semple as governor.

Meanwhile Lord Selkirk had arrived in Canada. Hearing at Montreal of the misfortunes of his colonists, he had engaged the services of 100 discharged soldiers and set out for the West. While he was yet on the way, stirring events were happening in the Red River Valley. The Nor'westers, angered by the destruction of their fort on the Red, bestirred themselves to destroy the settlement. A strong band of half-breeds was gathered at Portage la Prairie, under the leadership of Cuthbert Grant. Upon 19 June 1816 Governor Semple was informed that a body of horsemen was approaching over the prairie. Taking a small force, he marched out to inquire the purpose of the intruders. This move precipitated a skirmish at a spot now marked by the Seven Oaks monument. When the firing ceased Semple and 21 of his followers lay dead or mortally wounded. By this disaster the settlers were forced to again leave their homes.

The news of Seven Oaks was the signal for great rejoicing at Fort William, the headquarters of the Northwest Company. The joy of the Nor'westers, however, was rudely dispelled by the sudden arrival of Lord Selkirk. The latter, acting in the capacity of magistrate, arrested several of the leading partners, and sent them down to York, Upper Canada. In the following spring he pushed on to the Red River, where he promptly restored the ejected colonists to their farms, settled his soldiers about Fort Douglas, and made a treaty with the Indians.

When the news of the tragic death of Semple and his men reached England, the Imperial government at once interfered. Both parties to the quarrel were ordered to give up all posts and property seized. The death of Lord Selkirk in the year 1820, though to be regretted,

CANADA—THE CANADIAN WEST

was beneficial to the West, removing as it did the last obstacle in the way of a union of the fur companies.

After the union, which took place in 1821, the management of the company's affairs rested with an official known as the governor of Rupert's Land, assisted by a council of chief factors and traders. A strong man was needed for the governorship, and such an one was found in the person of a young Scotchman named George Simpson, who ably guided the fortunes of the company during the next 40 years. To the enterprise of the Hudson's Bay Company, in no small measure, Great Britain owes her control of the Pacific coast. From the north Russia, from the south the United States, were pressing rival claims which threatened to shut out Great Britain entirely from the sea. Under Simpson's aggressive administration the country between the Rockies and the Pacific was occupied. A fleet of six armed vessels protected the company's coast trade, of which Fort Vancouver was the centre.

Meanwhile the Selkirk settlement, clustering about the historic walls of Fort Garry, was winning its way to prosperity. The hardships of pioneer life in the East were here repeated. Spade and hoe, sickle and cradle, flail and quern, all told of the day of small things. A series of disasters, in the form of grasshoppers and floods, failed to shake the courage of the sturdy settlers. The growth of the colony made necessary a change of government. The people complained that the members of the council of Assiniboia were paid servants of the company, and did not, therefore, represent the popular will. Discontent was a sign of progress, a sign that the settlement was growing beyond the control of a fur company.

The steadily growing importance of the Pacific country made it imperative to determine the boundary line between American and British territory in the West. The 49th parallel was the accepted line as far as the Rockies, and it was agreed that for the time being the country beyond the mountains should be "free and open" to both nations. In 1846 the Oregon treaty continued the boundary line along the 49th parallel to the channel separating Vancouver Island from the mainland. The line was to follow this channel southwesterly to the Pacific Ocean. For several years the ownership of the Island of San Juan was in dispute. The question was finally referred for settlement to the emperor of Germany, who gave his award in favor of the United States.

To maintain order among the lawless miners whom the discovery of gold had drawn to the Pacific coast, a separate government was established on the mainland. New Westminster, on the Fraser River, became the capital. This arrangement, however, proved unsatisfactory; and at times there was talk of annexing Vancouver Island to the United States. Fortunately a strong British sentiment prevailed, which led to the reunion, in 1866, of the island and the mainland, to form the province of British Columbia. Victoria was chosen as capital.

The British North America Act made provision for the admission to confederation at any time of British Columbia, Rupert's Land, and the Northwest Territories. The first Do-

minion parliament petitioned the British government to hand over to Canada Rupert's Land and the Northwest. It was claimed that the rule of a fur company did not tend to the general development of the country, and, moreover, that the extension of the Dominion westward would be a safeguard against any aggression on the part of the United States. The Hudson's Bay Company finally surrendered to Canada its control of Rupert's Land and its monopoly of trade. The company, in return, received the sum of £300,000, one-twentieth of all land thereafter surveyed for settlement, and also retained its posts and trading privileges.

At the time of confederation (q.v.), the only occupants of the land beyond Lake Superior were roving bands of Indians, a few scattered traders, and 12,000 settlers in the valley of the Red River. Ten thousand of these 12,000 were half-breeds, Scotch and French. Into this community, without warning, flocked Canadian surveyors to lay out roads and townships. The country had been handed over to Canada and the interests of the natives were to be sacrificed. Such was the thought of the half-breed element. The storm centre was the French half breed party, the Métis, led by Louis Riel (see RIEL REBELLION). There was no one in the colony to restrain the latter's madness. Fort Garry was seized and a "provisional government" established. There was every prospect, however, of a bloodless settlement of the situation, when suddenly Riel, in a moment of recklessness, ordered the execution of a young Ontario immigrant named Thomas Scott. The news of this brutal murder raised a storm of indignation in the East. In a remarkably short time a volunteer force under the command of Col. Garnet Wolseley, reached Fort Garry, only to find that the instigators of the rebellion had fled across the American border.

Out of the strife of rebellion arose a new province. Even while Wolseley's force was on its way up from the East, the Manitoba Act passed the Canadian Parliament. Manitoba was admitted into Confederation as a full-fledged province. The claims of the half-breeds were fully met by a generous land grant. Many of Wolseley's men remained in the new province to share in its making. The little settlement about Fort Garry was soon transformed into the populous city of Winnipeg. Manitoba drew her first governor from the far East, in the person of a distinguished Nova Scotian, Adams G. Archibald.

A year later the westward expansion of confederation was continued. British Columbia became part of the Dominion, subject to a very important condition, namely, that a transcontinental railroad should be begun within two years and completed within ten years from the date of union. In 1872, therefore, Sir John A. Macdonald introduced the question in Parliament. The great enterprise was well under way when the ministry, charged with corruption, was forced to resign. Alexander Mackenzie, who succeeded Sir John, proposed to construct the road gradually, as the finances of the country allowed. This delay put a severe strain upon British Columbia's loyalty to the Dominion. The Macdonald government, returning to power in 1878, immediately took up again the railway question. Construction was

CANADA — THE CANADIAN WEST

begun from both ends; and with such vigor was the work pressed forward that the last spike was driven by Lord Strathcona in November 1885. The completion of a transcontinental railway cemented the bond binding the East and the West.

No sooner was order restored after the Riel rebellion than settlers began to flock into Manitoba. Many farmers from eastern Canada moved west, while from Europe came an ever increasing number of colonists, of British, Scandinavian, and German stock. The newcomers spread beyond the limits of Manitoba, many finding their way into the valley of the Saskatchewan, a few even to the foothills of the Rockies. This Northwestern Territory was governed by the lieutenant-governor of Manitoba, and a council of 11 members. In 1876 a change took place. The eastern section of the country, called Keewatin, was placed under the personal control of the lieutenant-governor of Manitoba, while the western was given a resident governor and a council of five members. A few years later four districts were organized, Alberta, Assiniboia, Athabasca, and Saskatchewan. Regina, being situated upon the main line of the Canadian Pacific Railway then under construction, was chosen as the seat of government.

The advent of the railway gave promise of peaceful and rapid progress, when suddenly a second rebellion broke out. At the close of the Red River rebellion many of the Métis withdrew westward and settled upon the banks of the Saskatchewan, among their near relatives, the Cree Indians. Here they were disturbed by the encroachment of a hated civilization. Their unrest was increased by a fear of losing their lands through the failure of the Dominion government to issue title deeds. The sudden return from exile of Louis Riel was all that was needed to provoke rebellion. Near Duck Lake, within the angle formed by the North and South Saskatchewan, the first clash took place, between a band of Métis and a force of mounted police and volunteers.

The position of the white settlers of the Saskatchewan valley was serious. The real danger lay, not in a revolt of the Métis, but in the possibility of a general rising of the Indians, of whom there were over 30,000 in the Northwest. Prince Albert, Battleford, and Fort Pitt lay exposed to attack. The most serious risings of the Indians took place near Battleford and Fort Pitt, among the followers of Poundmaker and Big Bear. The heart of the rebellion was the village of Batoche, the centre of the Métis settlements. The news of the fight at Duck Lake was the signal for an outbreak among Big Bear's warriors, who massacred the male inhabitants of Frog Lake and then drove out the garrison of Fort Pitt. When the report of the rebellion reached Ottawa, the Dominion government took prompt action. The call for volunteers met with an eager response on all sides. In spite of the great distance, within less than two months 4,400 men were placed in the field, all save the Winnipeg contingent being from eastern Canada.

General Middleton, commander-in-chief of the Canadian militia, who arrived at Qu'Appelle in advance of the main force, made the

Canadian Pacific Railway the base line of his operations, and prepared to crush the rebellion in all its centres at once. Three places were in immediate danger: Prince Albert, Battleford, and Fort Pitt; three relief expeditions were provided for in the plan of campaign. General Middleton was to advance from Qu'Appelle to Batoche, Riel's headquarters, Colonel Otte from Swift Current to Battleford, and General Strange from Calgary to Edmonton. The three movements were successfully carried through, the divided forces converging upon Battleford. The bulk of the fighting fell to Middleton's column, which met with determined opposition at Fish Creek and Batoche. With Riel, Poundmaker and Big Bear finally in custody, the rebellion was at an end. Riel and eight Indians suffered the death penalty.

The rebellion was not without its good results. In recognition of their growing importance, the Northwest Territories were granted representation in the Dominion Senate and House of Commons. The need of a stronger government in the Northwest became obvious. The old council was abolished and its place taken by an elective assembly, which first met in 1888, at Regina. The next few years witnessed a struggle for responsible government, but in the end the assembly came to enjoy powers practically equal to those of all the provincial assemblies of the Dominion.

The discovery in 1897 of rich deposits of gold in the Yukon (q.v.) was the signal for an influx of fortune-hunters. As a result the long standing dispute over the Alaskan boundary gathered new importance. In taking over Alaska from Russia in 1867, the United States secured all the rights of that nation as laid down in the treaty of 1825, between Russia and Great Britain. The interpretation of the terms of the treaty was left to a commission, composed of three representatives from the United States, two from Canada, and Lord Alverstone, the chief justice of England. The commission met in London in September 1903. The decision was, upon the whole, favorable to the American claims. See ALASKAN BOUNDARY COMMISSION.

The growth of the West during the last quarter of a century has been very marked; the inevitable result of the expansion of the Canadian railway system. The Canadian Pacific Railway (q.v.) worked a marvelous change. At the terminus of the road there sprang up, as in a night, the bustling city of Vancouver, while the line throughout was soon dotted with villages. Many of these have now risen to the dignity of towns, a few even aspire to take rank with the cities. To north and south the road has thrown out branch lines, everywhere developing new districts. No sooner has one transcontinental railway opened up a broad belt of land than a second is suggested. Already a new company, the Grand Trunk Pacific, has entered into a contract with the Dominion government to build another railway from coast to coast. If this contract is carried out, the proposed line will run parallel with the Canadian Pacific, and will open a new Northwest.

CANADA — THE SETTLEMENT OF THE CANADIAN WEST

Canada — The Settlement of the Canadian West. Without a just appreciation of the attractions and possibilities of the "Canadian West," as the larger half of the Dominion situated west of Lake Superior has commonly been called, neither the Canada of to-day nor that of the future will ever be understood. One of the first acts of statesmanship after the consummation of Confederation (see CANADA — CONFEDERATION) was the purchase by the Canadian government from the Hudson's Bay Company (see CANADA — HUDSON'S BAY COMPANY) of the immense territory forming the basin of Hudson Bay and known as Rupert's Land, over which that company held proprietary rights. British Columbia, in 1871, entered the Dominion thus brought up to her borders. Some 14 years later followed the completion of the Canadian Pacific Railway (q.v.), an enterprise of splendid self-confidence in so young a country. A railway was needed to fulfil the conditions upon which British Columbia had joined the Confederation, and without it the vast territory between that province and Ontario could not be developed nor preserved to Canada. The purchase of Rupert's Land created the conditions which brought about and justified the building of the first transcontinental railway, and the prolonged discussions over the policy of the government of the day in respect to the public assistance given to that road began the process of popular education in eastern Canada in the extent and resources of the West. A seemingly limitless sphere for internal development has gradually been revealed, and the necessity on two occasions for the employment of armed force against half-breed rebellions, with some sacrifice of blood, has sealed the sense of possession. Pioneers proved the fertility of the soil and the richness of the mines, and with the assurance of a rapidly increasing population the whole national life has received an access of vigor and hopefulness. External policy, as well as internal, has been influenced. A country that can produce and export staple foodstuffs in quantities capable of indefinite multiplication, and has vast stores of timber, coal, and metals, can support great home industries and also be a prominent factor in international trade. It can work at home and bargain abroad. It can make choices. The idea of a trade union of the British empire, for example, has presented itself in practical form largely because of the potentialities of the Canadian West. Population only has been needed to show results, and the movement of population into this part of Canada is therefore a subject of more than passing interest and importance.

The country lying west and northwest of Lake Superior in Canada is of vast extent and great variety. It includes the extreme western end of the province of Ontario, the province of Manitoba, the three organized territories of Assiniboia, Saskatchewan, and Alberta, and the province of British Columbia, while beginning again at the east and lying to the north of these districts are the Territories of Keewatin, Athabasca, Mackenzie, and Yukon. The land area in these districts in acres is:

District	Area in acres
Ontario (western end) approx.....	20,000,000
Manitoba	41,169,098
Assiniboia	56,498,546

District	Area in acres
Saskatchewan	66,460,859
Alberta	64,973,212
British Columbia	236,922,177
Keewatin	292,478,010
Athabasca	155,622,704
Mackenzie	340,886,420
Yukon	125,649,500

For present purposes the northern Territories, with the exception of Yukon, may be disregarded, since they have not yet attracted population to any marked degree. The western end of the province of Ontario is rich in timber and minerals, and possesses stretches of good agricultural land. The prairie region begins at the eastern boundary of Manitoba and extends to the Rocky Mountains, embracing Manitoba, Assiniboia, Saskatchewan, and Alberta: wooded prairie and open prairie, rolling and flat, broken by hills and some rocky ridges and drained by great rivers that flow eastward and northward into great lakes with outlets into Hudson Bay. No richer agricultural lands and no better grazing ranges exist than are here found. Of the 230,000,000 acres in this combined district it would be idle to estimate the proportion of good grain land. It is very large, as attested by the successful farms now scattered throughout the whole region. In 1903 only 5,073,424 acres had yet been put under crop. It is known, moreover, that the fertile belt extends up into the northern tier of Territories. British Columbia is a land of magnificent mountains rich in minerals, and of valleys of the very highest agricultural possibilities, nearly the whole clothed with splendid forests. See CANADA — AGRICULTURE; CANADA — MINERALS; CANADA — THE FORESTS AND LUMBER INDUSTRY.

In 1901 the Canadian West, not including the portion of Ontario, was shown by the census to have a population of 645,517. Out of this number 250,901, or 38.87 per cent, had been born in the West; 154,581, or 23.94 per cent, had been born in the eastern provinces of Canada; 83,579, or 12.94 per cent, had been born in the British Isles; and 145,369, or 22.52 per cent, had been born in foreign countries, while 8,299, or 1.28 per cent, had been born at sea or failed to give their birthplace. Indians numbered 61,518 and half-breeds 28,255. By origin 356,411 were of British stock, 29,579 of French stock, 54,714 of German, 23,836 of Scandinavian, 23,460 of Russian, 16,949 of Austro-Hungarian, and 20,073 of Chinese and Japanese. All the leading nationalities and races of Europe were represented. To understand the nature and the rate of the movement of population into the Canadian West indicated by these figures, many general considerations must be borne in mind. Conditions as they have existed in the United States are among the most important of these considerations. Until the closing years of the last century the United States was an irresistible magnet. It drew the best, as well as much that was not the best, of the movable population of all countries. From Canada itself it attracted a larger proportion of the native population than from any other country. Its relative advantages over Canada, in the eyes of those who sought to better their condition, consisted in its advanced stage of development. Not only were there more varied employment and larger opportunities in industrial and commercial life, but its fertile lands were opened up by railways from ten to forty years before

CANADA — THE SETTLEMENT OF THE CANADIAN WEST

those in the Canadian West and the mineral wealth of its western mountains was discovered and advertised to the world years before the riches of Canada in this respect were even suspected. The prairie regions of the Canadian West had to wait for transportation facilities, and then they had to wait until their profitability was established. Since people are not predisposed to believe in the security of agriculture in northern latitudes, this meant, practically, that they had to wait until the prairies in the United States were tested right up to the border. Before that time even official crop returns could not be widely effective as inducements to immigration. Moreover streams of migration are not easy to divert. Where many have gone others tend to follow.

To what extent the United States drew upon Canadians up to 1900 is shown in the census returns of that year which record the residence in that country of 1,181,255 persons born in British North America, that is, in Canada and Newfoundland. How little the United States had given in return appears from the comparatively small number of 127,899 natives of the United States resident in Canada when the Canadian census was taken in 1901. But conditions have changed. The flow of population from Canada to the United States has been checked and the tide has turned. Canada has made steady and substantial progress and her industries now provide opportunities for all her own people who desire industrial employment, while the large immigration into the cities of the United States from Eastern and Southern Europe has rendered industrial life in the United States less attractive. But what is of more direct importance to the present subject, the cheap, good lands in the United States are now very largely occupied. Prosperity and a good birth-rate among the farming population have created a host of landseekers of native birth apparently more than numerous enough to take up, within a few years at least, what good land is still easily available: and the price of land has rapidly risen. In the Canadian West, on the other hand, millions of acres of the most fertile land are obtainable at low cost; this land has been proved; and railway facilities and railway rates put the crops within profitable reach of the markets.

The history of the settlement of the Canadian West may conveniently be divided into three periods: the first embracing the time before railway facilities existed or, say, up to 1885; the second from 1885 to 1901; and the third beginning in 1901. So far as the prairie division is concerned fur traders visited it and dwelt in it from early times, but no attempt was made at colonization previous to that of Lord Selkirk in the decade succeeding 1812. That his venture, beset with misfortunes though it was, left a permanent result was shown by the fact that in 1873 as many as 530 of the original Selkirk settlers or their white children were found to claim the grants of land offered by the Canadian Parliament. Other independent colonists had made their way into the country and there were, of course, the employees of the Hudson's Bay Company, but in 1869, when the purchase by Canada was made, the total white population numbered only a few hundreds. Some members of the military expedition of 1870 remained as settlers and other accessions

were received at about the same time. In 1871 the Dominion Government appointed the first immigration agents in the West, one in Manitoba and another in the Territories, and authorized the establishment of an "immigration shed" at Winnipeg, a hamlet then possessing 241 inhabitants. The work of promoting immigration to Canada had been undertaken by the Federal Government in 1868, the provincial governments co-operating, and the appointment of agents in the West brought that section into direct touch with the general system having agents in Great Britain and Europe. It is interesting to note that in his annual report to the department for 1872 the agent at Winnipeg estimates the arrivals during the year at 1,400, of whom 954 came from Ontario, 78 from Quebec, and 115 from the United States. During 1872 and 1873 the Dominion Government entered into negotiations with a colony of German Mennonites living in southern Russia who desired to emigrate. Delegates visited Canada and in 1874 1,349 of these people settled in southern Manitoba. This is important, not only because it led to further immigration from the same source but also because the attention of the Dominion Government was thus directed to the question of special colonization in the West. In 1874 Scandinavian and Icelandic delegates were shown through the country and a small beginning was made in Icelandic settlement through the moving up from Ontario of 285 Icelanders. The years 1874 and 1875 may be noted also because the Dominion Government then first appointed Canadian immigration agents in the United States, chiefly for the purpose of effecting the repatriation of Canadians. Results were at once obtained and agents reported some 400 repatriated Canadians as immigrants into the West in 1876 and some 800 in 1877. In 1879 a delegation of tenant farmers of Great Britain visited the country and their reports resulted in an increase in immigration from the British Isles. The projected transcontinental railway had met with difficulties and delays, but in 1875 work was begun at Thunder Bay, the head of Lake Superior, on the section to Winnipeg, and in 1878 a line from the United States border at Pembina was completed to St. Boniface, opposite Winnipeg across the Red River. Although the line from Lake Superior was not completed until 1883, the line from Pembina increased the facilities for reaching Winnipeg (q.v.), and the railway building combined with other not unnatural causes led to a "boom" in real estate, accompanied by a rush of speculators and prospective settlers. In 1881 the immigration agents estimated the arrivals in Manitoba at about 25,000, in 1882 at almost 70,000, and in 1883 at 50,000. Eastern Canada and the United States contributed the great proportion of these visitors, as most of them proved merely to be. The boom "burst" in 1883. By the census returns for 1881 some estimate of what was permanent in the immigration of the previous years can be reached. Manitoba was given a total population of 65,954, of whom 18,020 were born in Manitoba itself, and 6,422 in the Territories. Of these two classes 6,767 were Indians, but the halfbreeds were not separately enumerated. From outside the largest number was furnished by the province of Ontario, namely 19,125, Quebec supplying 4,085 and Nova Scotia 820. Natives of England and Wales numbered 3,457, of

CANADA — THE SETTLEMENT OF THE CANADIAN WEST

Scotland 1,836, and of Ireland 2,868. Russia supplied 5,651, chiefly Mennonites; Germany, 220; Norway, Sweden and Denmark, 121; and France, 81. The United States had contributed 1,752. In the same year the white population of the Territories was 6,974, of whom 517 were born in Ontario, 101 in Quebec, 98 in England and Wales, 136 in Scotland, 62 in Ireland, 27 in France and 116 in the United States. As the Canadian Pacific Railway was pushed through real settlement followed at a faster rate than ever before and in 1886 when the first train was run from Montreal to the Pacific coast the net gain in population from the principal sources, over the figures just given for 1881, was: From Ontario 14,996, from Quebec 1,891, from Nova Scotia 497, from New Brunswick 363, from England and Wales 6,865, from Scotland 4,146, from Ireland 753, from Iceland 1,500, from the United States 570; while each of the other countries showed small gains. The chief sources of increases in the Territories were Ontario 8,300, Quebec 1,200, England and Wales 3,750, Scotland 2,000, and the United States 890.

It will not be necessary to follow in detail the records of the succeeding years up to 1901, which form the second period. The Canadian Pacific Railway Company, which had received large grants of land, became an additional agency in the organizing of immigration movements as also to a limited extent did the colonization societies which had purchased tracts of land in 1882, 1883 and 1884. A movement which began in 1889 and 1890 and ultimately attained considerable proportions was that from Austria-Hungary. The year 1890 was marked by a considerable immigration from Great Britain. Migration from the eastern provinces of Canada remained moderate until 1898. In 1899 over 7,000 Doukhobors were brought in and established in colonies. According to the census of 1901 Manitoba had a population of 238,934, not counting Indians and half-breeds. Those born in Canada numbered 164,582. Of the Canadians 67,566 were born in Ontario, 8,492 in Quebec, 1,536 in Nova Scotia, 820 in New Brunswick, 419 in Prince Edward Island, and 167 in British Columbia. In England there were born 20,036, in Scotland 8,099, in Ireland 4,537, and in Wales 356; in Austria-Hungary 11,570, in Russia 8,854, in Iceland 5,403, in Germany 2,285, in Norway, Sweden and Denmark 2,090, in France 1,470, and in the United States 6,922. The Territories had a population of 185,335, exclusive of Indians and half-breeds. Of the 65,231 born in Canada, Ontario was the birthplace of 28,229, Quebec of 4,075, Nova Scotia of 1,169, New Brunswick of 669, and Prince Edward Island of 488. Those born in England numbered 10,752, in Scotland 4,226, in Ireland 2,158, and in Wales 186; in Austria-Hungary 13,407, Russia 14,585, Norway, Sweden and Denmark 2,462, Germany 2,170, France 1,023, Iceland 424, and the United States 13,877.

Before touching the movement of the past three years into the prairie region a few words may be said of the progress of settlement in British Columbia. In 1901 the population of that province was 149,708, again excluding Indians and half-breeds. The composition of the population of British Columbia differs from that of the districts we have just been considering in several interesting respects. In the first

place, it contained in 1901 relatively a larger number born in the United States, namely, 17,164. Then there were 14,576 Chinese and 4,515 Japanese. Ontario contributed 23,642, but Nova Scotia came next among the provinces with 4,603. These features are easily explainable. The chief attractions of British Columbia have been its mines, its forests, and its fisheries. The first named have in many different years caused rushes from the United States and they have been an added attraction to the people of the province of Nova Scotia. The man from Ontario is a good pioneer under any conditions. And the same causes that drew Chinese to California have operated in the case of British Columbia. The first gold rush to British Columbia occurred in 1858, nine years after the memorable rush to California. It is said that between 20,000 and 30,000 prospectors from California invaded the province in that year. Systematic exploration, however, was not attempted and the mining population came and went in waves, the years 1858, 1861, 1864, 1865, 1869, and 1872 marking the influxes. Up to 1893 nearly all the gold produced was placer gold and the values ran from \$705,000 in 1858 to \$3,913,563 in 1863, continuing at an average of over \$3,000,000 until 1868, when with variations a decline set in. The working of lode mines since 1893 has given an element of permanence to the mining population and the product of gold has risen in 1902 and 1903 to \$5,900,000. The copper, silver and lead mined exceed gold in their total value. Coal was known to exist from early times and seems to have been mined since 1836, but it was not until 1875 that the annual production exceeded 100,000 tons. The increase has been steady and the product in 1903 exceeded 1,600,000 tons. The magnificent timber resources of the province have given employment to an increasing number of men and the yield of the fisheries has grown from \$100,000 in 1876 to \$7,900,000 in 1901. In 1871, when British Columbia became a province in the Dominion, the population was 36,247, of whom 25,661 were Indians. In 1881 it had increased to 49,548, in 1891 to 98,173, and in 1901 to 178,657.

The Yukon territory might perhaps be classed with British Columbia. In 1896 the gold discoveries were made there which caused the famous rush in 1897. The census of 1901 gave the Yukon a population of 24,357, exclusive of Indians and half-breeds. Natives of the United States numbered 6,707, of Ontario 1,940, of Quebec 1,349, of Norway and Sweden 1,265, of England 1,153 and of Germany 746; not specified 6,573.

The part of Ontario included in the Canadian West has interests of its own in mines and fertile land, but its progress in settlement has been largely bound up with that of the prairie region to the west. The mines in the Lake of the Woods district caused the establishment of the substantial town of Rat Portage, the continued prosperity of which, however, came to depend to a great extent on the lumber industry for the supply of the demand in Manitoba and the territories. Port Arthur and Fort William on Thunder Bay, Lake Superior, are at the head of lake navigation on the Canadian route, and the summer traffic in goods for the West and in grain and flour from the West is there transhipped, the towns possessing immense storage and shipping grain elevators. These towns are

CANADA—THE SETTLEMENT OF THE CANADIAN WEST

growing rapidly, particularly since 1901, and their growth will keep pace with the development of the West. The completion of the Canadian Northern Railway between Port Arthur and the wheat fields, running through the southern part of the province, has not only assisted Port Arthur but has opened up the valley of the Rainy River and new centres for the lumber industry. In 1901 Rat Portage had a population of 5,202, Fort William of 3,997 and Port Arthur of 3,212. Since that date the population, especially of the two last mentioned towns, has greatly increased and new towns have sprung up along the line of the Canadian Northern.

The third period in the settlement of Manitoba and the Territories began in 1901. Conditions to which reference has previously been made had developed and the time was ripe. In the United States a greater movement of land-seekers was taking place than at any previous time, with the exception perhaps of the early eighties, and good available lands for pioneers were fast becoming occupied. This movement was not directly from the more thickly settled Eastern and Middle States to new lands, but from these States to the Northwestern and Southwestern States. The newcomers were willing to buy lands under cultivation at prices which were comparatively large to the men who had broken them. It was the men who had entered the Northwestern States as pioneers ten, fifteen or twenty years before who were offered tempting prices, and in thousands decided to become pioneers again. This movement of population was directed by the railway companies and by private land companies, the managers of which had their connections in all parts and thoroughly understood the business of land settlement. The new feature in the history of immigration into the Canadian West in 1901 was the advent of these United States land companies. As soon as prospects seemed to indicate a good crop in that year, their agents appeared in considerable numbers and purchased large tracts. This continued in 1902. To show the magnitude of the operations it may be mentioned that one of these companies purchased in one block about 1,100,000 acres. The lands thus secured could be offered to land-seekers in the United States at from \$4 to \$10 per acre. In certain localities, or in the case of improved farms, the price was higher. The man who could sell his farm in the Dakotas, Minnesota, or Iowa, for example, at from \$30 to \$75, or even \$100 per acre was offered land in Canada, which returns showed was capable of producing more bushels to the acre, for a price which would not only pay the expenses of the transfer but leave him with a bank account. In most cases the large blocks of land purchased were sold in smaller lots to middlemen and the number of agents thereby largely increased and distributed. Enterprising Canadian land companies also existed and greatly increased in numbers. By 1903 the first phase of this new development, that is, the purchase of large blocks of land by speculating settlement companies, had almost come to an end. The policy of the government is opposed to selling except to the actual settler and the Canadian Pacific Railway Company, the Hudson's Bay Company and the Canada Northwest Land Company, the other largest owners of land, were likewise unfavorable to the too extensive operations of speculative middlemen.

It was to the interest of the railway company, particularly, to secure the actual settler as soon as possible and it was believed that prices could most effectually be kept at an attractive level by retaining the retail selling of the lands in the hands of the company. Large sales were, however, made by these Canadian companies in blocks as well as in farms during 1901 and 1902. Their returns show these total sales:

CANADIAN PACIFIC RAILWAY COMPANY.			
Year	Acres	Value	Average price
1901.....	831,732	\$2,646,237	\$3.18 per acre
1902.....	2,420,265	8,140,598	3.36 per acre

HUDSON'S BAY COMPANY.			
Year	Acres	Value	Average price
1901.....	71,703	\$351,487	\$4.90 per acre
1902.....	196,844	999,685	5.08 per acre

CANADA NORTHWEST LAND COMPANY.			
Year	Acres	Value	Average price
1901.....	121,069	\$ 629,130	\$5.19 per acre
1902.....	515,800	2,518,000	4.88 per acre

The elimination of speculative buying has caused smaller returns for 1903. The Canadian Northern Railway Company, which possesses a land grant of considerable size, has recently handed over the selling of its lands to a powerful private company. The government still has millions of acres of homestead lands, as well as lands held for sale, and the following returns of homestead entries for the last four calendar years will indicate the demand existing:

Year	Entries
1900.....	7,850
1901.....	9,108
1902.....	22,215
1903.....	32,682

Among the factors at work during this period, the immigration department of the government must be given a chief place. The number of agents in Europe and the United States had been increased and more money than ever before was spent in advertising Canada. In January 1904 the United States and Canadian land companies interested in Western Canada and leading business men in Winnipeg and elsewhere organized what is called the Western Canada Immigration Association and raised a fund of \$50,000 for a two years' campaign of education through the press of the United States. To this fund the Dominion Government, the government of the province of Manitoba and the city of Winnipeg gave contributions. The effect of the increased immigration from the United States was not alone in additions to population from that source, but the fact that United States farmers were seeking Canadian lands was an excellent advertisement in Europe. The most telling advertisements of all, however, were the splendid crops of 1901 and 1902. The government returns for Manitoba and the territories for the past six years are as follows:

1903	68,974	1,842,824	26.72

No Government crop reports were issued for the Territories before 1898, but in Manitoba they have been issued for 20 years. For that period the average yield per acre in Manitoba has been 19.05 bushels of wheat. The yield in 1900 was much the smallest on record and when the total production of wheat for the Canadian West jumped from 17,000,000 bushels to 63,000,000 bushels in a single year the attention of the world was startlingly attracted. The unsurpassed excellence of Manitoba hard wheat had been recognized, but a yield of 63,000,000 bushels for the first time gave the Canadian West a regulating influence in the world's markets. If a comparison of the above figures of yield per acre is made with the returns for Minnesota and North Dakota it will be seen what a powerful aid they became to the various advertising agencies. For the last four years the yield per acre in bushels of wheat in these two States and the average yield for the whole United States have been:

	1900	1901	1902	1903
Minnesota	10.5	12.9	13.9	13.1
North Dakota	4.9	13.1	15.9	12.7
United States	12.3	15.0	14.5	12.9

As to the results accomplished during the past four years it is impossible to present complete or reliable statistics. The figures given by the immigration department for the total immigration to Canada, during the fiscal years ending June 30, are:

	1903	1902	1901
English and Welsh	32,510	13,095	9,401
Scotch	7,046	2,853	1,476
Irish	2,236	1,311	933
United States	49,473	26,388	17,987
Galicians	10,141	6,550	4,702
Germans	1,887	1,048	984
Hungarians	2,156	1,048	546
Austrians	798	320	228
Scandinavians	5,448	2,451	1,750
French and Belgian	1,240	654	492
Russians, Finlanders	7,217	3,759	1,726
Miscellaneous	8,152	7,902	8,924
Totals	128,364	67,379	49,149

The unrevised figures for the fiscal year 1904 give a total of 130,329, of whom 50,915 came from the British Isles, 36,241 from the continent of Europe and 43,173 from the United States. The greater part of this total immigration was directed to the Canadian West and there was also a large migration from eastern Canada, estimated by the immigration commissioner at Winnipeg at 8,604 in 1901, 12,530 in 1902, and 17,286 in 1903. By the same authority the increase in the population of the Canadian West in the fiscal year ending June 30, 1903, from the above sources, was 115,000 and in 1904 about 110,000. See CANADA — THE CANADIAN WEST.

W. SANFORD EVANS,

Editor of 'The Telegram,' Winnipeg.

Canada — The Constitution. In the Canadian draft of the bill, Canada was styled a "Kingdom." For that title "Dominion" was substituted at the instance of Lord Derby, who thought that the title "Kingdom" might be offensive to the Americans. Sir John Macdonald, as a strong monarchist, deplored the change, feeling that had the title "Kingdom" been adopted the Australian colonies would have been applying to be placed in the same rank as the kingdom of Canada. As it is, the Australian colonies have adopted the title "Commonwealth," suggestive rather of progress in democratic sentiment.

The term Confederation has been applied to two forms of polity materially different from each other. One is confederation proper; the other is nationality with a federal structure. The instance of confederation proper in ancient history is the Archæan League; in modern history, instances are the original Swiss Bund, the United Netherlands, and the Union of the American colonies during the Revolutionary War. Instances of a nation with a federal structure are the United States of America under their present constitution and the present Swiss Bund. A confederation proper is formed for a special object, usually that of common defense. The several States entering into it do not resign their sovereign power. Nor does the federal council

CANADA — THE CONSTITUTION

exercise, like a national government, authority over the individual citizen, but only over the States. Its legislative power is confined to the fulfilment of the special object of the federation. Nor has it any power of taxation, but only a power of requisition. In the case of a federation proper, the Federal government is an organ of the States governments collectively. In the case of a nation with a federal structure, the States are severally organs of the federal government. The Canadian confederation belongs, as its name Dominion of Canada imports, to the class of nations with a federal structure. So does the newly formed Commonwealth of Australia.

The Canadian constitution is embodied in the act of the British Parliament called the British North America Act, which can be amended only by the power by which it was passed. In common with the other colonies, self-governed as they are styled, Canada remains in the allegiance of the British Crown, retains the constitutional forms and nomenclature of the monarchy, and is, to a certain, though of late years diminishing, extent, under the actual control of the Imperial government. The legislation of the Imperial Parliament is in all things binding upon Canada. To the king's government under the control of the Imperial Parliament belong the treaty-making power and the power of peace and war. By the Imperial government the governor-general, the legal head of the Dominion, is appointed. The supreme jurisdiction is still the British Privy Council, and in it is vested the interpretation of the Canadian constitution. The command of the army is still Imperial. So is the fountain of honor. The territory of the Dominion is part of the domain of the empire, at the disposal of the Imperial government, which has exercised its power in boundary cases. The tendency, however, since confederation, has been constantly toward practical independence. The veto power has been very sparingly exercised, and only in special cases, as in that of copyright where the colonial act conflicted with the Imperial law. Appeal from the colonial courts to the Privy Council has been restricted. Military occupation has ceased. Though the command of the army remains in the Crown, the military administration has passed, not without friction, into the hands of the Canadian minister of militia. The dispensation of titles and decorations, to which great influence is attached, still remains Imperial, though even in this the wishes of the Canadian government probably make themselves felt.

The Dominion of Canada and the other self-governing dependencies of the British Crown faithfully reproduce the forms of monarchy. The governor-general of Canada, as the representative of the British sovereign, has the prerogative of calling and dissolving Parliament, of appointing the members of the Privy Council, of nominating the Senate. Parliament is opened by him with a "speech from the throne." But, like the monarch whom he represents, he reigns but does not govern. Very rare have been the instances since the confederation, and those not cases of general policy, in which he has exercised his personal power. Only of the pageantry of his office and of his assumption of state has there since confederation been an increase, favored by those who desire to foster the monarchical sentiment. The lieutenant-govern-

ors of provinces, nominally appointed by him, are really appointed by his ministers, and invariably from the ranks of their own party. When one of them was dismissed it was apparently against the wish of the governor-general and manifestly on party grounds; yet on reference to the home government the governor-general was directed to conform to the opinion of his constitutional advisers.

The legislative power is divided between the central legislature and those of the provinces, the subjects of legislation assigned to each being set forth in the Act: The exclusive legislative authority of the Parliament of Canada extends to (1) The public debt and property; (2) The regulation of trade and commerce; (3) The raising of money by any mode or system of taxation; (4) The borrowing of money on the public credit; (5) Postal service; (6) The census and statistics; (7) Militia, military and naval service, and defense; (8) The fixing of and providing for the salaries and allowances of civil and other officers of the Government of Canada; (9) Beacons, buoys, lighthouses, and Sable Island; (10) Navigation and shipping; (11) Quarantine and the establishment and maintenance of marine hospitals; (12) The coast and inlet fisheries; (13) Ferries between a province and any British or foreign country, or between two provinces; (14) Currency and coinage; (15) Banking, incorporation of banks, and the issue of paper money; (16) Savings banks; (17) Weights and measures; (18) Bills of exchange and promissory notes; (19) Interest; (20) Legal tender; (21) Bankruptcy and insolvency; (22) Patents of invention and discovery; (23) Copyright; (24) Indians, and lands reserved for the Indians; (25) Naturalization and aliens; (26) Marriage and divorce; (27) The criminal law, except the constitution of courts of criminal jurisdiction, but including the procedure in criminal matters; (28) The establishment, maintenance, and management of penitentiaries.

To the provincial legislatures are assigned (1) The amendment from time to time, notwithstanding anything in the act, of the constitution of the province, except as regards the office of the lieutenant-governor; (2) Direct taxation within the province in order to the raising of a revenue for provincial purposes; (3) The borrowing of money on the sole credit of the province; (4) The establishment and tenure of provincial offices, and the appointment and payment of provincial officers; (5) The management and sale of the public lands belonging to the province, and of the timber and wood thereon; (6) The establishment, maintenance, and management of public and reformatory prisons in and for the province; (7) The establishment, maintenance, and management of hospitals, asylums, charities, and eleemosynary institutions in and for the provinces, other than marine hospitals; (8) Municipal institutions in the province; (9) Shop, saloon, tavern, auctioneer, and other licenses, in order to the raising of a revenue for provincial, local, or municipal purposes; (10) Local works and undertakings other than such as are of the following classes: (a) Lines of steam or other ships, railways, canals, telegraphs, and other works and undertakings connecting the prov-

CANADA — THE CONSTITUTION

ince with any other or others of the provinces, or extending beyond the limits of the province; (b) Lines of steamships between the province and any British or foreign country; (c) Such works as, although wholly situate within the province, are before or after their execution declared by the Parliament of Canada to be for the general advantage of Canada or for the advantage of two or more of the provinces; (11) The incorporation of companies with provincial objects; (12) The solemnization of marriage in the province; (13) Property and civil rights in the province; (14) The administration of justice in the province, including the constitution, maintenance, organization of provincial courts, both of civil and of criminal jurisdiction, and including procedure in civil matters in those courts; (15) The imposition of punishment by fine, penalty, or imprisonment for enforcing any law of the province made in relation to any matter coming within any of the classes of subjects enumerated in this section; (16) Generally all matters of a merely local or private nature in the province.

Powers not specifically given to the provinces are reserved to the Dominion, whereas under the American constitution powers not specifically given to the Federal government are reserved to the States or to the people.

The judges are appointed by the Federal government and, as in Great Britain, for life or during good behavior, in contrast with the practice of the United States, where judges are elected for a term of years. They can be removed only by the governor-general on an address from both houses of Parliament.

The Canadian Parliament consists, like the British, of two houses. The House of Commons, in which supreme legislative power practically resides, is elected almost by manhood suffrage. The North America Act apportions representation to the several provinces on the principles of population and provides for decennial readjustment to meet changes in the balance of population. Members are paid, whereas in Great Britain they are unpaid, and non-payment of members there forms a strong conservative institution. The Senators are appointed nominally by the Crown, really by the head of the party in power, and almost invariably on party grounds. Senatorships are for life, not hereditary like seats in the House of Lords, so that the political analogy is imperfect. On the other hand, party, which appoints the Canadian Senate, controls it. It might otherwise block legislation and there would be no remedial force; while the British House of Lords, it is well understood, must give way to the will of the nation when persistently declared. As it is, when the outgoing party happens to retain a majority in the Senate, there is danger of a block. The House of Commons is elected for a term of five years, subject, however, to the prerogative of dissolution.

The provincial legislatures are miniatures of those of the Dominion. The forms like those of the Dominion Parliament are monarchical, the lieutenant-governor formally nominating the ministers, as does the governor-general those of the dominion. The practical working is popular, elective, and partisan. The party divisions run through the provinces severally as well as through the Dominion at large. Quebec and

Nova Scotia, like the Dominion Parliament, have each two chambers; the rest have only one. The Federal government has a veto on provincial legislation.

The treatment of the Northwest Territories, as provinces, presents a certain analogy to that of the Territories of the United States, executive and legislative powers being given to a lieutenant-governor with an elective council subject to instructions by order under Federal council or by the Canadian secretary of state.

The Parliament is by law bilingual; the French language as well as the English being recognized, though practically English prevails. The civil law, in which the *Coutume de Paris* and the Code Napoleon are blended with the common and statutory law of Great Britain, remains the law of Quebec.

In its generally democratic character the Canadian constitution approaches to that of the American republic, but in their structure they materially differ. The American constitution, in accordance with the principle laid down by Montesquieu (q.v.), separates the Executive from the Legislative. The members of the President's council, miscalled a cabinet, have not seats in the Legislature, nor is their continuance in office dependent on its support. They are the nominees of the President alone. Under the Canadian constitution, as under the British, the members of the cabinet have seats in the Parliament, on the confidence of which their tenure of office depends, and in which they initiate and control legislation. The head of the American republic is elected for a term certain. The terms of members and the times of election are fixed by law, whereas the Canadian Parliament is called in the name of the Crown by the prime minister, the head of the party in power, who wields in the interest of his party the prerogative of summoning and of dissolution. The members of the Canadian Senate are chosen by the head of the party in power, whereas the American Senate is elected by the legislatures of the several States. Thus the Canadian constitution lends itself more aptly to the working of the party system of government, which, with all its accessories, political and moral, has prevailed, though the general influence of party cannot be stronger than it is in the United States.

In Great Britain the cabinet, in which the real power of government resides, is a growth of political party unrecognized by law, while the Privy Council, recognized by law, has become honorary. In Canada the Privy Council is the cabinet, at the same time conferring the honorary rank, but the relation to the Crown, the relation to Parliament, and the working of the system in both cases are the same.

The British North America Act does not, like the American constitution, prohibit the establishment of a particular religion by the state. It leaves untouched to the Roman Catholic priesthood of Quebec the power of levying tithes on the people of their own communion. In the section respecting education it perpetuates the privilege of denominational schools. Since confederation the government of Ontario has practically aided a denominational university. But since the secularization of the clergy reserves and the opening of the University of Toronto, non-interference of the state with religion may be said to have been established as

CANADA — LOCAL GOVERNMENT

a general principle and may be regarded as practically part of the constitution. See CANADA — CONFEDERATION; CANADA — LOCAL GOVERNMENT; CANADA — IMPERIAL FEDERATION; CANADA — UNDER FRENCH RULE; CANADA — UNDER BRITISH RULE.

GOLDWIN SMITH,

Formerly Regius Professor of Modern History in the University of Oxford, and Emeritus Professor of Cornell University.

Canada — Local Government. Under the British North America Act of 1867, which is virtually the constitution of the Dominion of Canada, the organization of local government is placed within the jurisdiction of the different provinces. There is consequently considerable variety in the structure of rural and urban government in the different parts of the Dominion. Certain general features are, however, to be observed. The fundamental principle of organization is that of local autonomy by the means of representative elected bodies. The provinces are divided into counties, subdivided into townships, in which again school sections are formed. The county and the township are not everywhere found side by side. Indeed, the provinces of Canada present the same contrast between the predominance of the township and the county as is found in the United States. In Nova Scotia and New Brunswick the county is the unit of local government; in Ontario and Quebec both township and county are found; throughout the West the township system prevails, the county being only a judicial area. In addition to these rural areas of government, there are found incorporated villages, towns, and cities. In Ontario and Manitoba incorporation takes place by virtue of a general statute; elsewhere it is done by special legislation. The details of local government may best be understood by first passing in review the organization and powers of rural governing bodies in the different provinces, and treating separately the question of town and city government and municipal franchises. Ontario, the most populous of the provinces, contains 43 counties and 423 townships. Both of these divisions vary greatly in size and population. The largest county (Grey) contains 1,071,642 acres, the smallest (Brant) only 196,800 acres. Thirty-two townships contain less than 20,000 acres, 11 of them more than 80,000 acres each. There are in addition the districts of Muskoka, Parry Sound, Nipissing, Manitoulin, Algoma, Thunder Bay, and Rainy River, not yet organized as counties, but in the settled portions of which 83 townships have been incorporated. The affairs of the townships are managed by a reeve and four councillors elected yearly. For the county there is a county council, varying in number from 8 to 18, two members being elected from each of the districts into which the county is divided. The cumulative system of voting was introduced in 1896. The franchise for all local elections is extremely wide. It includes all men, widows, and spinsters of 21 years and upward, rated for real property to an extent varying from \$100 in the townships to \$400 in the cities; those assessed for an income of \$400 and farmers' sons of full age living at home. The township council is chiefly concerned with the maintenance of roads and bridges, the levy and collection of school taxes and the collection of the county tax. Assessors

appointed annually by the township council make a valuation of real and personal property. The other principal officers of the township are the treasurer and the township clerk. The latter, though legally holding office at the pleasure of the council, enjoys a practically permanent tenure. He prepares the collector's rolls, statute labor lists, voters' lists, etc., registers births, deaths, and marriages, and performs many other duties assigned to him by separate statutes. The county council meets at the "county town," under the presidency of a warden whom it elects annually. It acts largely through committees, both standing and special. It appoints a treasurer, a county clerk, an engineer, a public school inspector, and two auditors. The county council provides accommodation for the courts of justice, maintains county buildings, roads, and bridges, houses of refuge, etc. The county rate is collected with the local taxation, but the county council has power to "equalize" the valuations of the local assessors if it thinks necessary. For organization of school districts, and control of schools in Ontario and elsewhere, see article on PUBLIC EDUCATION IN CANADA. Local government in the province of Quebec is organized under a municipal code enacted by the legislature (24 Dec. 1870), and revised in 1888. The larger towns and the cities are incorporated under special charters granted by the legislature. Of the counties some are divided into parishes, others into townships. For each county there is a council composed of all the mayors of the included municipalities. At its head is a warden (*préfet*) whom it annually elects. The county council meets in regular session four times a year; its duties consist chiefly in the construction and maintenance of roads, bridges, etc., the locating of the circuit court, provision against forest fires, etc. The subordinate local councils (parish, township, united township, village, and town) consist of seven councillors elected annually throughout the province, each council having a mayor as its head. The powers of these minor councils extend to highways, bridges, ferries, regulation of public health, etc. For all local purposes direct taxes are levied on all real estate, except the property of the government and that of religious and educational institutions. (For organization, etc., of schools, consult article on PUBLIC EDUCATION.) The seigniorial tenure of land, which once carried with it certain powers of local administration, is also treated in a separate article. The local government of New Brunswick is regulated by a consolidated statute of 1898. Each county has an elected council, meeting twice a year. The larger cities have a representative in the county council as well as their own local council. The officers of the parishes are appointed by the county council. In Nova Scotia there are elective county councils, choosing its own wardens. Their by-laws are subject to the approval of the legislature. The counties of Prince Edward Island are electoral and judicial areas, but, owing to the small size of the province the legislature itself acts as the organ of local government; villages and towns are, however, incorporated with elective councils. In Manitoba, in the Northwest Territories, and British Columbia local government centres in the township, administered by a council of four to six members, with a reeve at its head. The unorganized territories (Yukon, Mackenzie, Keewatin, and Ungava) are

CANADA—RELATIONS TO GREAT BRITAIN

controlled by the Dominion government, and have no representative institutions. The government in Canadian cities is regulated by statutes of the provincial legislatures. This fact permits of frequent change, and a continuous development of organization to meet the circumstances of the hour. In Toronto, for example, and in many other cities, it is the practice to suggest to the Parliament from year to year such alterations of the municipal act as seems advisable. In the majority of the Canadian provinces towns and cities are incorporated by special legislation; in Ontario and Manitoba, by virtue of general statutes on proclamation by the lieutenant-governor. Even in these provinces, however, special declaratory acts are usually passed announcing the incorporation and making provision for liabilities, etc. The typical form of Canadian urban government consists of a single chamber of aldermen (varying in number from 9 to 26) with a mayor. Both the mayor and council are generally elected for one year. In Montreal and Quebec the mayor is elected for two years, and in the latter city is chosen from among the aldermen. In Montreal, Quebec, Winnipeg, Brandon, and Vancouver the aldermen are elected for two years. A board of control (the mayor with four aldermen), whose function it is to prepare the annual estimates, has recently (1897) been adopted for the cities of Ontario (except Hamilton) having a population of more than 45,000. Municipal offices are, in most cases, filled by appointments made by the mayor or the council. In the cities of Ontario and British Columbia, in Winnipeg, Charlottetown, and Saint John, police appointments are made by commissioners independent of the civic government. The liquor licenses are almost everywhere under the control of the provincial authorities. The municipal suffrage in Canada is more restricted than the rural or parliamentary. Throughout Ontario, in Montreal, Quebec, Calgary, and the four largest cities of British Columbia a special qualification of real property or income is demanded. The chief sources of civic revenue are found in taxes on real property (averaging 21.8 mills on the dollar in Ontario 1898), betterment taxes, and, in some cases, license taxes and percentage receipts from city franchises. Municipal indebtedness, incurred mainly for waterworks and education, has much increased of late years, but the rate of interest on city debentures, which formerly stood at 6 and 7 per cent, has now in many instances fallen to 3 or 4. The total debt of Montreal in 1902 was \$27,000,000, of Toronto in 1901 about \$22,000,000. Except for waterworks there is but little municipal management of public works. Winnipeg, New Westminster, Three Rivers, and a number of minor towns in Ontario own and operate electric plants. Street railway franchises are granted for periods varying from 15 to 30 years; in Toronto, Montreal, Hamilton, Ottawa, and Halifax the city receives a percentage of gross receipts.

STEPHEN LEACOCK,
Lecturer in Political Science, McGill University.

Canada—Relations to Great Britain. When the Canadian Confederation was formed its founders believed that they were establishing a nation. Their hopes have been slow of fulfilment, for, though the phrase "The Canadian Nation" is frequently used, that *status* Canada has not really attained. She is still under tutelage. Her Parliament exists not by the will of her own people, but under an enactment of the Parliament of Great Britain, which, in theory, may at any time change the Canadian constitution without reference to the Canadians themselves. Canada possesses no treaty-making powers. She has no authority to make either war or peace. She does not even control her own copyright laws. (See COPYRIGHT, CANADIAN.) There is an appeal from her courts to the king's privy council in London. But while on these lines a formidable list of restrictions could be drawn up, the will of the Canadian people is in fact supreme in regard to Canadian affairs. Authority once granted, the Imperial Parliament would never venture to revoke, though from time to time in the borderland of rival jurisdiction the cabinet at London has caused annoyance in Canada by what seem unreasonable checks. Again, British statesmen vie with each other in generous statements as to Canadian autonomy.

It is becoming more and more obvious that to Great Britain's policy and needs in the present day the co-operation of Canada is necessary. The Dominion occupies the middle ground between the East and West, and has in geographical situation the advantages possessed by the United States. The Canadian wheat fields are increasingly necessary for Britain's food supply. While in Canada there is striking devotion to the political tie with Great Britain, it goes hand in hand with a resolute conviction that her own domain Canada must rule for herself. No coercion of Canada by Great Britain would have any prospect of success. Probably the thought of coercing Canada would never occur to British statesmen. In any case the Dominion has her destiny in her own hands.

When Canada is called a "colony" the epithet is resented by the Canadian people; and Mr. Chamberlain, Lord Rosebery, and other British statesmen have avowed their sympathy with this dislike, since the title carries the brand of inferiority. It is sometimes suggested that the word "Dominion" in Canada's title should be changed to "Kingdom," since "Dominion" implies possession by some other power, while "Kingdom" asserts an equal status with England, Scotland, and Ireland. It is not improbable that in the future increased attention will be given to this proposal. There is no doubt that Canada is a little restless in her present situation and resents the patronizing attitude often adopted toward her in Great Britain. But to become a kingdom she must assume the full burdens of equal *status*. At the present time the British government spends considerable sums in maintaining fortifications in Canada and in keeping up military and naval establishments on the Atlantic and the Pacific. Canada's excuse for permitting these things to be done for her are two-fold; she has been spending enormous amounts in building railways that among other things serve military purposes, and she claims, too, that since she has no voice in regard to war or peace, those who control these issues may properly bear the expense of defense.

CANADA — IMPERIAL FEDERATION

The relations of Canada to the United States are hardly less important to her than those of Great Britain. It has been difficult for many to understand why Canada, with so many ties in blood and ideals to the United States, with so much to be gained commercially by the step, should not join the Union. It may be answered that smaller nations have always been jealous of absorption by great neighbors. During centuries Scotland fought the proposals for union with England. At the present time little Holland, linked in blood with Germany, dreads the prospect of any political tie. There were periods when Canada seemed likely, to a superficial observer, to consent to annexation. In 1849, from the depths of great commercial depression, some of her political leaders, one of whom, Sir John Abbott, afterward became prime minister, openly proclaimed their desire for annexation. From 1888 to 1891, in a similar time of distress, commercial union with the United States, which would almost certainly have involved political union, was strenuously advocated by a powerful wing of the Liberal party. In spite of this the calmer judgment of the Canadian people has always been that it is best to remain a separate state. The United States and Canada together would be continental in size; if it is desired to prove that a state may become too big, the present condition of Russia need only be pointed to.

While this is true there is no doubt that throughout Canada a better feeling than was formerly apparent towards the United States now exists. Traces of hostility are still often found. The American commercial policy of a high tariff has hit Canada very hard and every attempt to soften its rigor has met with failure. With this present fact and the other fact that English-speaking Canada is in large degree descended from Loyalists driven out at the period of the revolution, it is not strange that hostile utterances should occasionally be heard. But though family traditions serve to perpetuate the old *animus* the issues of the revolution and of the War of 1812 are very, very ancient, with hardly more reality now than has Jacobite sentiment in England. When Canada was less important she was more sensitive and touchy and differences with the United States aroused greater feeling. Her present self-reliance has encouraged a better temper. Moreover the troublesome questions between the two countries have been for the most part settled. The only conflict possible is the commercial war involved in high tariffs and this is not likely soon to cease. Canada despairs of reciprocity in trade with the United States and has found markets elsewhere. See CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES.

No party in Canada favors any radical alteration of her present position. The more thoughtful Canadians undoubtedly dislike the existence of an even nominal subservience to the Parliament at Westminster. They want complete independence, but it is "Independence within the Empire," that is to say, independence which involves perpetual alliance between Canada and Great Britain for all national purposes. When Edward VII. was crowned his title was changed to that of "King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas." This proposal was not found as soothing in Canada as it was intended to be. "I claim independence of

the Parliament of Great Britain," says a Canadian publicist, Mr. J. S. Ewart, K.C., "and I object therefore to Canada being called a 'Dominion,' for the word implies subjection. Further, I object to being called a British Dominion, for I assert that Canada belongs not to the British but to Canadians. . . . And I resent being lumped with Trinidad and Guiana and Barbadoes as 'British Dominions over the Sea.'" The writer then proceeds to give his ideal for Canada: "Canada's Parliament shall be as omnipotent as that at Westminster. The king's Canadian ministers shall advise him upon all things Canadian with the same constitutional authority as that of British ministers to advise their sovereign about all things British; our own men shall decide our own law suits and command our own forces; and our own money shall provide for our own defence and for such mutual aid as we ourselves may approve." This is far removed from the ideal of what is called "Imperial Federation." (See CANADA — IMPERIAL FEDERATION.) Imperial Federation implies a central parliament clothed with at least some power, but Canada, which for generations has been struggling to increase her powers of self-government, will not consent to surrender any of the autonomy that she has won.

GEORGE M. WRONG,

Professor of History, University of Toronto.

Canada — Imperial Federation. Imperial federation is the name given to the various projects for revising the relations between Great Britain and her colonies, so as to give to the latter a share in the government of the empire. The growth of the colonies, and the increasing burden of national defence, naturally suggest that the colonies should contribute to the imperial revenue; on the other hand, such a contribution, unless accompanied by a voice in the councils of the mother country, would constitute that "taxation without representation" so abhorrent to Anglo-Saxon ideas. Such was the situation during the great controversy of the 18th century between Great Britain and her North American dependencies, and such is again the situation at the present day. Even in the 18th century various proposals were made for solving the colonial difficulty by admitting American representatives to the British Parliament. Governor Pownall (see POWNALL, THOMAS), Edmund Burke (q.v.), and Adam Smith (q.v.) made suggestions of this sort. But the difficulty of communication rendered any such federation impracticable. During the middle period of the 19th century it was currently believed that the manifest destiny of the colonies was independence. With the passing of that idea has arisen the demand for a closer bond of union. The imperial federation movement originated in the early '70s, an informal conference for discussing the subject being held in 1871. In 1884 the Imperial Federation League was founded, its first chairman being the Right Hon. W. E. Forster (q.v.). Lord Rosebery (q.v.), the Right Hon. Ed. Stanhope (sometime secretary of state for the colonies), and Sir Frederick Young (q.v.) (whose work, 'Imperial Federation,' had appeared in 1876) were interested in the movement from its inception. A significant event was seen in the London colonial conferences of 1887, to which representatives of both the self-governing and the

CANADA — IMPERIAL FEDERATION

crown colonies were summoned, and at which the subjects of imperial defense and trade were discussed. In 1892 a committee of the Imperial Federation League presented a practical scheme of federation. It recommended the institution of a council of the empire, to which delegates should be summoned from the self-governing colonies, the crown colonies, and India. The function of the council was to consist in the regulation of imperial defense. It was recognized, however, even at this stage of the movement, that there was no sufficient unanimity among the members of the League in reference to the details of the plan to be adopted to enable them to work effectively toward a common end. The League, whose work was declared to be only preliminary and preparatory, was dissolved in 1893 and its place was taken by a number of organizations having each a more definite purpose. Of these the United Empire Trade League became the advocate of the commercial union of the empire by means of protective duties. The Imperial Federation (Defence) Committee urges combined action for defensive purposes, the establishment of a navy supported by joint contributions being its immediate object. Most important, perhaps, is the British Empire League, established in 1894 and extended to the Dominion of Canada. The programme of the League aims at the permanent unity of the empire, the promotion of trade and inter-communication, the holding of periodic conferences, and co-operation in national defense. In Canada, indeed, the movement had already made considerable progress. The Imperial Federation League in Canada had been formed at Montreal in 1885, with branches subsequently established at various places in the Dominion. Under the auspices of the organizing committee of the League a distinguished Canadian, George Parkin, delivered addresses throughout Canada, and in 1889 was sent, on behalf of the parent league, on a tour of the Australasian colonies. In 1894, at the instigation of the Canadian government, a conference was held at Ottawa to discuss intercolonial trade and communication. The Imperial government, Canada, Cape Colony, and the Australasian colonies were represented. Resolutions were adopted in favor of reciprocal preferential duties among the colonies. A still more important conference was held in London in 1897 on the occasion of the jubilee celebration of that year. At this meeting the premiers of Canada, Newfoundland, New South Wales, Victoria, Queensland, South Australia, West Australia, Tasmania, New Zealand, Cape Colony, and Natal discussed with the Right Hon. Joseph Chamberlain (q.v.), secretary of state for the colonies, both the commercial and political relations of the mother country with the colonies. In reference to the former, a resolution was unanimously adopted favoring the "denunciation at the earliest convenient time of any treaties which now hamper the commercial relations between Great Britain and her colonies." The premiers also undertook to confer with their colleagues to see whether a preference could advantageously be given by the colonies to the products of the United Kingdom. In reference to political relations, the majority of the premiers endorsed the following resolutions: (1) "That the present political relations between the United Kingdom and the

self-governing colonies are generally satisfactory under the existing condition of things."

(2) "That it is desirable, whenever and wherever practicable, to group together under a federal union those colonies which are geographically united." (3) "That it would be desirable to hold periodical conferences of representatives of the colonies and Great Britain for the discussion of matters of common interest." From the first of these resolutions Seddon of New Zealand and Sir E. N. Braddon of Tasmania dissented, on the ground that the time had already come for a reconstruction of political relations. The Canadian government in the next year (1898) extended to Great Britain and to such British colonies as should reciprocate, a tariff preference of 25 per cent, increased in 1900 to 33½ per cent. In the summer of 1902, on the occasion of the coronation of King Edward VII., a further colonial conference was held between Secretary Chamberlain and the premiers of the self-governing colonies. The meetings of the conference, of which there were 10 in all, were also attended by several ministers of Australia and Canada then present in London, and by the members of the British cabinet whose departments were concerned in the discussion. Chamberlain submitted a paper showing the disproportionate share of the burden of imperial defense at present borne by the United Kingdom. "If you are prepared at any time," he said, "to take any share, any proportionate share, in the burdens of the empire, we are prepared to meet you with any proposal for giving to you a corresponding voice in the policy of the empire." No definite conclusion was reached for the alteration of present political relations beyond the following resolution: "That it would be to the advantage of the empire if conferences were held, as far as practical, at intervals not exceeding four years, at which questions of common interest affecting the relations of the mother country and His Majesty's dominions over the seas could be discussed and considered as between the secretary of state for the colonies and the prime ministers of the self-governing colonies. The secretary of state for the colonies is requested to arrange for such conferences after communication with the prime ministers of the respective colonies. In case of any emergency arising upon which a special conference may have been deemed necessary, the next ordinary conference to be held not sooner than three years thereafter." On behalf of the commonwealth of Australia £200,000 a year was offered toward the cost of the Australian Naval Squadron and naval reserve, from New Zealand £40,000 for the same purposes, from Cape Colony £50,000, and from Natal £35,000 for the imperial navy generally, and from Newfoundland £3,000 for maintaining a branch of the Royal naval reserve. The grants were subject to ratification by the colonial legislatures. Resolutions of a general character in favor of preferential trade were also adopted by the congress. The Australian contribution met with sharp criticism from the Melbourne *Age* as involving taxation without representation. In February 1903 the British Empire League in Canada passed a resolution against the abstention of Canada from naval contributions, and declared that "it would be proper for her . . . to contribute a fair and reasonable

CANADA—IMPERIAL FEDERATION

share toward the annual cost of the navy of the United Kingdom."

The question of imperial defense and colonial contributions has been under constant discussion in the colonies, especially in Canada and Australia, during the last two years. The general arguments in favor of a reconstruction of present imperial relations are very strong. The rapid growth of the population of the great self-governing colonies renders their exclusion from the government of the empire more and more at variance with the spirit of Anglo-Saxon institutions. The population of the United Kingdom (estimated June 1902) is 41,952,510, that of Canada (1901) 5,371,315, of Australia (1901) 3,771,715, of New Zealand 815,000, of Newfoundland 220,984, and the white population of the South African colonies about 850,000. The great discrepancy between the contributions made toward imperial defense by the people of the United Kingdom and those of the colonists is also very striking. The figures presented by Mr. Chamberlain at the conference of 1902 showed the per capita yearly expenditure for military and naval defense to be: for the United Kingdom, \$7.12; for Canada, 49 cents; for New South Wales, 83 cents; for Victoria, 79 cents; for New Zealand, 81 cents; and for the Cape and Natal, from 50 to 75 cents. A further general argument in favor of imperial federation is based on the fact that, though politically united, the various parts of the British empire do not form a commercial unit. The grant of representative institutions to British colonies in the middle of the 19th century carried with it the right to set up a protective tariff against the mother country, a right of which the colonies have made full use. The preferences recently granted by Canada, New Zealand, and South Africa are far from amounting to commercial unification. The cogeny of these general arguments is undoubtedly great, but when one passes from general considerations to explicit schemes of federation, difficulties of the gravest character are encountered. This is seen in the great variation in the different plans proposed. The League of 1892, as already said, proposed a council of empire supplementary to the British Imperial Parliament. Here difficulties at once occur. If the council is supreme over the British Parliament, then it would be necessary to effect a radical reconstruction of the sphere occupied by the latter. If it is inferior, it becomes merely an advisory body and represents no real colonial participation in imperial power. To meet this objection plans are proposed for the admission of colonial representatives to the British Parliament. As against this it is urged that the House of Commons, with its 670 members, is already too unwieldy for its work, and is already in a state of chronic congestion from the press of business, both British and imperial, with which it is compelled to deal. The question, moreover, arises as to whether the colonial representatives would be allowed to vote on all matters before the House or only on those of imperial import. The former system would obviously appear unjust to the people of Great Britain, the latter would introduce the cumbrous device of an "in-and-out" parliament, an arrangement notoriously difficult in operation. These objections seem logically to lead imperial federation toward such plans as those of Granville Cunningham ('Imperial Federation,'

1895) and Sir Frederick Young. By these writers a complete scheme of federation is proposed with an Imperial Parliament and local assemblies. Cunningham assigns a single local parliament for England, Ireland, and Scotland, with a viceroy representing the sovereign. Sir Frederick Young proposes a separate local parliament for each of the three divisions of the United Kingdom. A division of jurisdiction is suggested by Sir Frederick Young (address on 'Imperial Federation,' London 1903) as follows: "Imperial questions would comprise foreign relations, peace and war, national defence, revenue and expenditure for national, as distinguished from local, purposes, extensions of empire, the government of India, and generally all that comes within the department of international law." Such subjects as marriage, domicile wills, coinage, copyright, patents, railroads, might be left, the author thinks, "either to the Federal or Provincial governments without impairing the strength or efficiency of the imperial organization." Such a division of power would, however, introduce into British legislation the question of constitutional limitations and fundamentally alter the nature of parliamentary statutes and the relation of the judicial and legislative organs of government. The system of representation suggested by Cunningham would distribute the 300 members of the proposed Imperial Parliament as follows: England 185, Scotland 25, Ireland 40, the colonies 50. Of the colonial members he would allot 20 to Canada, 15 to Australia, and 5 each to New Zealand, the Cape settlements, and the West Indies. Such schemes of colonial representation at once meet with the difficult question of the extension of the franchise to the native races. "What," asks Prof. Goldwin Smith ('Saturday Review,' February 1897), "are they going to do with the West Indies? Are they going to import the negro vote into the political and diplomatic councils of the empire?" The same writer considers that colonial representation would carry with it the danger of the obtrusive influence of colonial party politics on the Imperial Parliament, the colonial members voting "in the Imperial councils with their eyes fixed on the ballot-box at home." A serious difficulty is also presented by India, whose population of 287,000,000 seems admittedly to be outside of the Imperial representation. Whether or not the government of India would fall within the sphere of the Imperial Parliament is a matter of divergent opinion. If it did not, the relations of India with the separate parliaments of England, Ireland, and Scotland would be difficult to adjust. Further trouble is presented by the question of the House of Lords. Would the Imperial Parliament be composed of a single chamber or of two? Mr. Cunningham, who makes the House of Lords the upper chamber of his Imperial Parliament, suggests that it would be necessary to add a few life peers (perhaps 20) to represent the colonies. It is not stated why they should be "few" or why they should only be life peers. Perplexing also is the question of the public finance of the reconstructed empire. The national debt of the United Kingdom and the debts of the colonies would have, in some way, to be adjusted to the new relations. The consideration of revenue raises the question whether imperial federation would necessitate a customs union; in this case either Great Britain must

CANADA — PRIMARY EDUCATION

abandon free trade, or the colonies must abandon protection. These and other difficulties which beset any practical scheme of federation serve for the present to keep the political problem of imperial relations in suspense and postpone its solution until the pressure becomes more intense. To the commercial aspect of the question renewed interest has been directed by Mr. Chamberlain's present agitation in favor of a revision of the British fiscal policy. Consult: Parkin, 'Imperial Federation' (1892); Cunningham, 'Scheme for Imperial Federation' (1895). STEPHEN LEACOCK,

Lecturer on Political Science, McGill University.

Canada — Primary Education. According to the British North America Act, education within the Dominion was entrusted to the several Provinces. One reason for this was doubtless the fact that in language and creed the Provinces differed so widely. Each Province has worked out a system suited to its own particular needs and conditions, and though there are striking similarities in aims and methods, yet there are great diversities in details of administration and in results attained.

Education Free.—Speaking generally, primary education is free to all pupils of school age, that is, from 5 or 6 years to 18 or 21. In one of the Provinces a fee may be charged, but this is merely nominal. In kindergarten schools and secondary schools, the payment of fees as supplementary to state, municipal, and district aid is sometimes permitted.

The Central Governing Bodies.—In every case the system is administered by a central authority. In Prince Edward Island the Board of Education consists of the executive council, the principal of Prince of Wales College and Normal School, and the chief superintendent of education, the last-named officer being appointed by the lieutenant-governor in council. In New Brunswick the Board of Education consists of the executive council, the chancellor of the provincial university, and the chief superintendent of education, who is appointed by the lieutenant-governor in council. In Nova Scotia the Council of Public Instruction consists of members of the executive council, of whom five shall form a quorum, and the chief officer is a superintendent of education appointed by the lieutenant-governor in council. In Quebec the Council of Public Instruction consists of (1) the Roman Catholic bishops of the Province, (2) an equal number of Roman Catholic laymen, (3) an equal number of Protestants. The last two classes are appointed by the lieutenant-governor in council. This Council of Public Instruction is divided into two committees known as the Roman Catholic and the Protestant committee, each being concerned with the administration of schools of its own kind. The practical administration of schools is carried on through a superintendent of education, who is appointed by the lieutenant-governor in council, and through two secretaries, one for each section of the Council of Public Instruction. In Ontario the Department of Education consists of the executive council or a committee

thereof, and the head of this department is known as the minister of education. In the matter of examinations the department is advised by an educational council of 12 persons, 6 of whom are appointed by the senate of the university. In Manitoba the executive council forms the Department of Education, and an advisory board, consisting of members chosen by the government, the university and the teachers of the Province, has authority in such practical matters as the framing of a programme of studies, the certification of teachers, the authorization of text-books. In the Northwest Territories the Department of Education is presided over by a member of the executive council known as the commissioner of education who is assisted by an educational council of five persons, at least two of whom shall be Roman Catholics. In British Columbia the Council of Public Instruction is composed of the executive council, and the work under its direction is carried on by a superintendent of education.

Local Self-Control.—Though the governing bodies just mentioned regulate education as regards the organization, government, examination, and inspection of schools, the certification and training of teachers, the authorization of text-books, and other matters of like importance, yet much power is given in most of the Provinces to local school boards. Each district selects its own teacher, but must not take any one who has not a certificate to teach in the Province. Within limits each district erects the building it considers most suitable under the circumstances and equips it as it may desire. There is wise supervision in matters of this kind to prevent undue expenditure and to guard against overcrowding of pupils and lack of apparatus. In British Columbia the Council of Public Instruction is supreme in all matters, virtually doing away with district control, except in the selection of teacher.

The Religious Difficulty.—The constitution of the governing bodies in education indicates that there has been difficulty in establishing and administering school systems because of the conflicting religious beliefs of the people. A closer examination emphasizes this fact. In Quebec there are two systems of schools—one for Roman Catholics, one for Protestants. In Ontario there is a system of separate schools. In New Brunswick after a struggle lasting for many years a compromise has been effected whereby separatists have practically all they demand, though they have not separate schools in name. In the Northwest Territories separate schools are supported by the state. In Manitoba, which until 1890 had Protestant schools and Roman Catholic schools, there is now but one system.

Religious Exercises.—Closely connected with the separate school question is that of religious teaching and religious exercises. In British Columbia, schools must be conducted on strictly secular and non-sectarian principles. No religious dogma or creed shall be taught. The Lord's Prayer may be used in opening or closing school. No clergyman of any denomination shall be eligible for the position of superintendent, teacher or trustee. In the Northwest Territories no religious instruction shall be given until half an hour previous to school

CANADA—PRIMARY EDUCATION

closing in the afternoon, after which time any such instruction permitted or desired by the board may be given. It is not compulsory on any pupil to attend during this period. Any school may be opened by the recitation of the Lord's Prayer. In Manitoba, schools may close with the reading of the Bible without comment and the recitation of the Lord's Prayer, and it is possible for clergymen or their appointees after half an hour before closing to give religious teaching to those of their own denomination. In Ontario every public school shall be opened with the Lord's Prayer and closed with the reading of Scriptures and the Lord's Prayer, or the prayer authorized by the Department of Education. Teachers who have conscientious scruples in this matter may be relieved. Attendance during religious exercises is not compulsory. Religious teaching may be given by the clergy or their representatives after the regular hours of school. In Quebec, in the Roman Catholic schools, there is daily prayer and systematic daily instruction in the catechism. In Protestant schools the first half hour is devoted to prayer, Scripture reading, instruction in morals, and Scripture history. No denominational teaching may be given. A conscience clause is operative. In New Brunswick the teacher may open and close the school by the reading of Scripture and by offering the Lord's Prayer. In Prince Edward Island the school is opened with Scripture reading, but no comment or explanation is permitted. In Nova Scotia the law is practically the same as for the last two provinces, local option being permitted.

The Support of Schools.—The schools of the Dominion are maintained by a fund drawn from three sources—a state fund, a municipal or county fund, and a fund yielded from district assessment. The government aid is distributed in different ways. In Prince Edward Island and New Brunswick the grant depends upon the sex and the grade of certificate of the teacher. In Nova Scotia it depends upon grade of certificate and the number of days school is open. In Quebec the sum depends upon the population of the district, and in Ontario it is divided among the counties, townships, cities, and towns in a similar manner. In Manitoba a definite sum depending upon the total grant available is given to each school open the full year, and a proportionate sum to schools open for less time. In the Northwest Territories the grant depends upon the size of the district, the number of days school has been kept open, the grade of certificate held by the teacher, and the percentage of attendance. In British Columbia the government meets practically all the expense of education except in the case of cities. Here a per capita grant is given. In Manitoba and the Territories no less than one-eighteenth of the whole land is set aside for school purposes. It is doubtful if any other country has made such ample provision for education.

The Salaries of Teachers.—In the older Provinces, when free schools were introduced and districts began to be formed, it was natural that every settler should wish to be near the school-house. This led to small school districts. When the burden of supporting the small district fell upon the small district there was a tendency to reduce the salary of the

teacher to the lowest amount possible. The result has been most unhappy. In spite of excellent provision for the instruction and training of teachers it is now impossible to get as many who are fully-qualified for their work as there are schools; and the male members of the profession are becoming fewer every year. This is particularly true in those communities where there is great industrial activity and consequent openings for men. The question of consolidation of rural schools is now under discussion. In the more thickly settled parts of the older provinces consolidation may in time help to solve one of the greatest problems of elementary education in Canada. But it can never be more than a very partial solution. In the west the districts are about as large as they can be made. Consolidation in most cases is an impossibility. Relief can come about in only two ways: (1) There must be an increase of legislative aid; (2) there must be increased local support. The former is probably an impossibility because of the limited resources of the Provinces; the latter will come only as a matter of education. No people are in a better condition financially than the Canadian farmers. The burdens of taxation are comparatively light. Yet the salaries paid to teachers are very meagre. In Prince Edward Island the average salary in 1902 was \$216.09, and a number were living on \$130. In Nova Scotia the salaries vary from \$438 for male teachers of the "B" grade and \$293 for female teachers of the same grade, to \$184 for males of "D" grade to \$167 for females of the same grade. In Ontario the salaries average \$436 for males and \$313 for females. In Manitoba the average for all is \$488. In the Territories the average is \$47.07 per month.

Wherever salaries are small two things are noticeable: (1) The percentage of female teachers is large; (2) the percentage of trained teachers is small. In the Northwest Territories not over 5 per cent of the teachers are untrained; in Manitoba conditions are almost equally satisfactory. In Nova Scotia about 43 per cent of the teachers have taken normal training. In New Brunswick where salaries are small less than 20 per cent of the teachers are men; in Nova Scotia about 18 per cent; in Ontario 24 per cent; in Manitoba 30 per cent; in the Northwest Territories about 43 per cent. The small salaries, therefore, affect the schools in two very important respects, and this is being felt from one end of the Dominion to the other.

Training of Teachers.—The training of teachers is something to which all the Provinces have given much attention, though the system adopted is not uniform throughout. In Ontario, Manitoba, and the Northwest Territories the course is purely professional and based on a definite academic course. In other Provinces the academic and professional work are carried on simultaneously as in many of the normal schools of the United States. (See *TEACHERS, PROFESSIONAL TRAINING OF; SCHOOLS, COUNTY TRAINING.*) The tendency in professional training seems to be toward a short course for beginners, followed by actual experience in a schoolroom and then a longer and more philosophic course leading to a permanent license. The fact that all certificates are granted by provincial rather than local authori-

CANADA—SECONDARY EDUCATION

ties does much to elevate the standard of the profession.

Teachers' Institutes.—The work of the normal schools is supplemented by teachers' institutes which are of two kinds, (1) Those arranged for and carried on under the direction of the Department of Education; (2) those which are purely voluntary on the part of the teachers. These institutes do much toward developing a professional spirit, toward bringing teachers into touch with educational progress in other lands, and toward bringing school and home into closer relationship. The greatest of these gatherings of teachers is the Dominion Educational Association, which meets every two or three years. All departments of education are here represented. As yet this association is in its infancy, just having held its fourth meeting, but it promises to be to the Dominion what the National Educational Association is to the United States. See COLLEGES FOR TEACHERS.

School Libraries.—It is recognized throughout Canada that school libraries are a necessity in education. In most of the Provinces grants are made to supplement the grants of trustees. The Northwest Territories has made the most complete provision by making it compulsory for trustees to spend annually a portion of the regular grant in the purchase of books for library purposes.

Coeducation.—A distinctive feature of Canadian elementary schools is the coeducation of the sexes. There are exceptions to this rule in Quebec and in a few leading cities of the other provinces. In all rural communities coeducation must continue to be the practice, and it is doubtful whether there will be any departure from customary procedure in cities and towns. The results morally and intellectually under present conditions seem as satisfactory as in lands where separation of the sexes is considered a necessity.

Courses of Study.—The course of study pursued in the various provinces does not differ very greatly from that followed in other civilized lands, though emphasis may not be placed on the same subjects. Though direct moral instruction is not systematically given in all the Provinces, it is doubtful if anything could be more salutary than the influence of the schools. The high moral standing of the Canadian citizen must be attributed in a measure to the faithful labor and supervision of the public school teacher. In addition to the study of the five central subjects,—language, literature, mathematics, geography, and history,—emphasis has of late been given to manual training (q.v.), and nature study (q.v.). The former branch received prominent notice owing to the liberality of one of Canada's most worthy citizens—Sir William McDonald. The work in nature study is carried on successfully in several of the Provinces and with excellent results. In the cities and towns particularly music and drawing are taught. The play impulse is recognized in the games of the school. In these the teacher frequently takes a prominent part. Though physical exercises are usually conducted for a few minutes each day and serve as a relaxation from mental labor, there is lacking that medical supervision in all things pertaining to bodily welfare, which is so necessary.

It is generally recognized in elementary schools that the method of study, and the mental attitude developed in pupils, are of as much importance as the facts learned. The power for self-direction developed in Canadian youth, is amply proven by the behavior of manhood. The method of classification, even in the large city schools, does not appear to have crushed out the individuality of the pupils. It may have removed idiosyncrasies, but it has still left power for independent action. The ideal of school government in Canada, though not fully realized in many cases, is that of a kindly authority which induces power of self-control. In this, the temper of the Canadian people is expressed. However, in the home as well as in the school, well-meant liberty often develops into license. Intelligence, right habits of thought, and good morals are often noted where manners and good taste are in a marked degree lacking. Yet on the whole the type of life represented in Canadian elementary schools is of a very high order.

Canada may be considered the land of the common school. With the one unfortunate exception already noted, there is nothing in the public school system which recognizes class, race, or creed. The school is the most potent agency for unifying the diverse elements of the population. With the exception of the foreigners who are entering the west, practically all children can read, write and calculate. Nearly all go to school for at least a portion of the school year. Probably for this reason no vigorous steps are taken to enforce the compulsory education clauses of the school acts. See ELEMENTARY EDUCATION; CANADA—SECONDARY EDUCATION; CANADA—HIGHER EDUCATION; CANADA—CATHOLIC EDUCATION. See also the section *Education* in the articles on the different Provinces.

W. A. McINTYRE, B.A.,
Normal School, Winnipeg.

Canada—Secondary Education. The public high schools of the English-speaking provinces have been modeled more or less upon those of Ontario, which was the first (1844) to organize a system of public instruction. As a result, there is a very general similarity amongst them. Quebec, however, which is largely French and Roman Catholic, with an English-speaking Protestant minority, has organized its high, as well as its elementary schools, in accordance with its exceptional conditions.

Secondary education in Canada is provided for in three classes of schools which are well distributed geographically and are known sometimes by different names in the different provinces:

(1) Public high schools, in which secondary education alone is provided for. A few do also the first year or the first and the second year work of the universities.

(2) Public high school grades in connection with the elementary schools. Sometimes such grades are as good as the high schools, and often gradually develop into separate institutions.

(3) A small number of private secondary schools. These have usually elementary grades attached and occasionally do the work of the earlier years of the universities. Their fewness is due chiefly to the efficiency of the public systems, which were organized early in the history of most of the provinces. As, however, the

CANADA — SECONDARY EDUCATION

wealth increases, more of such schools are established, but they are now, and will likely continue to be, comparatively unimportant factors in the education of the Dominion.

The public high schools differ markedly from those of the United States in being organized into one system in each province and in being controlled and supported by the province as well as by the locality. The causes which thus tend to uniformity in the individual systems have in most been reinforced by uniform examinations of the different grades, conducted by the central authority. The State-control is exercised by a minister of education, who is a member of the provincial cabinet, or by a superintendent of education, responsible to the cabinet, or by both. Such controlling officers have associated with them an advisory council, variously constituted, with more or less important powers. The functions of the State are legislative and general. Subject to this oversight, which is exercised directly and through government inspectors, and which prescribes text-books, courses of study, and school regulations, local boards of trustees or commissioners have complete control, appointing the teachers and managing the finances. The boards are thus able to deal with local conditions, while the State connection has secured a measure of uniformity and general efficiency of courses and standards. The State contributes often very liberally to the support of the public high schools, the expense of establishment and the rest of the expense of maintenance being provided for by local taxation. Sometimes small fees are also charged.

The private schools are generally proprietary and of denominational origin; and, as a result, nearly all of them are under denominational control. Although affected in their courses and organization by the denominating public systems, they have no connection with the State, except in the case of a few which are affiliated with State universities, or of some Quebec schools which are subsidized under certain conditions. Except also in Quebec, the public high schools are open to and attended by all denominations. The private schools, on the other hand, are usually sectarian, but the religious training given in most of the Protestant schools is such that they are patronized by the adherents of other churches than those with which they are connected.

All the secondary schools have more or less extended curricula, corresponding to those of the United States high schools; but, as there, the entrance and the leaving standards vary according to the system of organization, the efficiency of the elementary schools, the requirements of the universities, and the wealth and population of the different provinces. The Ontario high schools are the best developed and the most efficient, being, as regards standard, on a par with the best in the United States. Besides providing a general education, the Canadian high schools prepare for university matriculation, for commercial pursuits, and for teachers' non-professional certificates. In one important and far-reaching respect they differ from the high schools of the United States: their teachers must all hold certificates of scholastic and professional competency, authorized by the respective education departments, and varying in standard and character according to the conditions of the system. Such teachers are usually obliged to attend professional schools. Ontario, however, is

exceptional in having a normal college, in the city of Hamilton, with a practice school attached, the former being controlled and supported by the government. Here are trained for one year the highest grade of public school and high school teachers. In the other provinces the normal schools provide the general professional training for all grades.

Following are additional details in regard to each of the provinces:

Ontario.—Here the special secondary schools are of two classes, high schools and collegiate institutes. The principal of each must be a graduate in arts of a university in the British dominions, with at least two assistants for a high school, and three for a collegiate institute. The staff of the latter must be specialists (usually with honor university degrees) in Classics, Mathematics, Moderns and History (including English), and Science, with a specialist in art and in the commercial subjects, some having as many as 20 teachers. Both classes of schools must have good accommodations and a minimum equipment—\$800 for a high school, and \$1,600 for a collegiate institute. The latter must also have a gymnasium, for which each school receives a maximum grant of \$160 a year; a special grant of \$80 a year may also be made to a high school which has one. Besides the separate high schools, there are, in connection with the elementary schools in localities where there are no high schools, fifth forms or continuation classes, which also do high school work of a character sometimes as good and as comprehensive as is done in the high schools. The teachers of these grades must hold first class certificates or other professional certificates satisfactory to the inspector and in accordance with the character of the work undertaken, but many of them are university graduates. Pupils pass from the fourth grade of the elementary (called public) schools (age 12 to 14) into the secondary schools, on uniform examination papers set by the education department and valued by local boards. Just recently, however, city boards have been given the right to set their own papers or to accept, under certain conditions, the promotion examinations of the public school staffs. The standard of entrance in Ontario is at least equal to that of the best United States high schools. Besides the usual courses, these schools may have special art, commercial, manual training, household science, and agriculture departments. These departments are not yet well developed. Already, however, the city of Toronto (q.v.) has a separate technical high school; and there are technical high school departments, with manual training and household science, in six or seven other centres of population. A high school is established by a county (or city) municipal council with the concurrence of the government, and its establishment involves a legislative grant of from \$450 to \$1,600 according to the grade, as well as its proper maintenance by the county and by the municipality in which it is situated. After providing for a minimum grant of \$375 the rest of the legislative grant is distributed on the bases of the attendance, the value of the equipment, the amount of the teachers' salaries, and the character of the accommodations, a system which has greatly stimulated local expenditures and has done much to secure the efficiency of the schools. Some of the boards of

CANADA — SECONDARY EDUCATION

trustees are separate from those of the public schools, and others have charge of both classes of schools as in the United States. In constitution they are peculiar in containing a representative of the Roman Catholic separate elementary school, if there should be one in the municipality (the city of Toronto has two). Until recently, as in the other provinces, the education department held uniform leaving examinations at the end of the course in each form. Now, however, as the consequence of evils associated with so much uniformity, these examinations have been discontinued and the department itself holds only those that are necessary for teachers' certificates. It continues, however, to conduct, through its educational council, the uniform matriculation examinations authorized by the universities of the province. In other matters also the educational policy of Ontario is now one of decentralization. Total number of high schools 138, of which 41 are collegiate institutes and 52 are free. Number of teachers 600, of whom 489 are university graduates (chiefly Canadian), and 368 hold honor degrees or the equivalent. Highest salary, \$3,000; average for principals, \$1,220; for assistants, \$699. Number of pupils, 24,472; total legislative grant, \$112,650; total county grant, \$130,125; total local grant, \$384,401; total fees, \$105,801; total expenditure, \$709,680. Total number of continuation classes (public school and Roman Catholic here separate) 480, of which 65 have each one or more classes doing high school work alone; total number of pupils, 4,864.

The public secondary school system is so efficient and so popular with all classes that there are very few private schools. Of these the chief is Upper Canada College (which, however, is only semi-private), an old historic residential school, at one time under government control, but now under a board of governors partly elected by the "Old Boys," and partly nominated, the State connection being maintained through the minister of education who is an *ex-officio* member. This college has still a small endowment, but is supported chiefly by fees. It does general and university matriculation work for boys, and is attended by pupils from all parts of the Dominion and even from the United States. Besides ladies' colleges which have been established in some of the cities, there are a few other colleges for boys, doing elementary and general work and that for university matriculation. One or two also have mixed classes, the chief being Albert College, Belleville, which was at one time a university but is now affiliated with the University of Toronto (q.v.), providing courses of various kinds and grades, as far as the end of the university work of the first year. With only one or two exceptions all the private schools are connected with denominations.

Quebec.—As has already been stated, the public secondary schools of Quebec differ from those of the other provinces in being denominational, Protestant and Roman Catholic, the latter being French. Of both classes, there are two grades called model schools and academies. The Protestant model and academy courses each extend over three years. On completing the first academy grade, pupils may enter McGill (Montreal) Normal School for teachers, and on completing the academy courses (pass matriculation) they may enter the universities. The Roman Catholic model and academy courses, on

the other hand, extend each over two years and have no classical departments. On completing the four years' courses, pupils enter the Roman Catholic classical colleges to prepare for the universities. These colleges furnish good courses in philosophy, languages and literature, but are defective in science. They confer certain degrees and are a combination of high school and college, attended by boys and young men. Most of them are affiliated with Laval (the chief Roman Catholic) University (q.v.). The model schools of both denominations correspond generally to the United States grammar grades, so that they are not really high schools of the usual type. Occasionally they have grades which overlap the academy and the elementary schools. The Quebec secondary system, although superior in character to its elementary system, is inferior to those of most of the other Provinces, and to the best in the United States. As regards relation to the State, some of the secondary schools are dependent, some are wholly independent, and others are partly so. The dependent schools are controlled and supported similarly to those in Ontario. The independent schools are supported chiefly by fees and are controlled generally by Roman Catholic ecclesiastics; but, when schools of this class follow the authorized courses of study, they are subsidized by the province. Most of the classical colleges have endowments, and some of them are comparatively wealthy. Lay teachers are required to hold professional State certificates; the religious teachers are exempt; but the law in regard to the lay teachers is not well enforced. A model school is established by agreement amongst the school boards of two or more municipalities, and is under the control of the board of the municipality where it is situated. The establishment of an academy (three teachers the minimum) is authorized by the superintendent of public instruction on application of the commissioners of two or more municipalities. Such schools are controlled by trustees appointed from their own members by the commissioners on whose initiative they were established. The principals of the Protestant academies are, with one exception, men, almost all being university graduates. Besides the ordinary model schools and academies, there are certain special secondary schools which do work of a higher character, the Boys' and Girls' High School of the city of Quebec, Stanstead Wesleyan College School, Bishop's College School, Westmount Academy, the High School of Montreal, and one or two others. At the close of the session of the Protestant schools, each grade except the third academy (examined by the university for matriculation) is subjected to a uniform examination on papers prepared under the supervision of the inspector of superior schools.

Of the model schools under control of commissioners, 367 are Roman Catholic, 47 Protestant, and of the academies, 44 are Roman Catholic and 27 Protestant. Of the independent or partly independent schools, 144 are Roman Catholic model schools, 105 are Roman Catholic academies, and 2 are Protestant; there are also 18 Roman Catholic classical colleges. Of 121,126 pupils in attendance, 111,724 are Roman Catholic and 9,402 are Protestant. Of the Roman Catholic lay teachers, 564 hold professional certificates; 109 have none. Of the Protestant lay teachers 306 hold professional certificates, 27

CANADA — SECONDARY EDUCATION

have not. The total number of Roman Catholic religious teachers is 3,242.

Nova Scotia.—There are twelve grades in the public schools of Nova Scotia, grades eight, nine, ten, eleven and twelve being high school. Very many of the rural elementary schools have superior grades which do the first and the second year and even the third year work of the high schools. In the towns and larger villages the high school departments are separate. The law allows one high school, called the county academy, in each county, to share in the \$10,000 which the Legislature grants for secondary education, in addition to the other grants to which they are entitled in common with the high school grades generally; provided the county academy is free to each pupil of the county who passes the uniform departmental entrance examinations. Should, however, the shire town fall below the superior school in equipment and accommodations, the latter may be made the county academy by the council of public instruction. Besides the uniform entrance examinations the education department holds uniform examinations in the courses of all the high school grades, and the universities and colleges of the provinces accept for matriculation the certificate of having passed grade eleven when it indicates a pass in the subjects they prescribe. There are 19 county academies with 59 teachers, of whom 20 are university graduates, class A (the highest) being the necessary professional qualification for the high school teachers of all grades of school. In 1903 the total enrollment was 7,081, of which 822 belonged to grade eleven, and 112 to grade twelve. Of the total attendance about 1,700 belonged to the county academies. Nova Scotia has 16 private schools which report an attendance of 476 as doing high school work.

New Brunswick.—Secondary education in New Brunswick is provided for in grammar and superior schools. The number of the former is 13, with 37 teachers and an enrollment of 1,084. Teachers holding license of the grammar school class receive from the government \$350 a year provided the district also pays the teacher at least an equal amount; but not more than four teachers in any one grammar school can receive this legislative grant. These schools are free to all pupils in the county in grades eight to twelve. Their work is of the usual character. Superior schools may be established in each county, one for every 6,000 inhabitants. The principal must hold a first-class superior license, and receives from the government a grant of \$250 a year. In this case also the trustees must add an equal amount. Superior schools in grades seven and upwards are free to all pupils residing within and belonging to the parish in which the schools are situated. As in the other provinces, many of these schools are high schools in everything except the name, and do the same class of work.

Prince Edward Island.—This province has no high schools proper, but provision for the work has been made in about 30 schools with high school departments, in 34 graded schools, and in some of the best conducted primary schools. In these grades about 1,400 pupils are prepared for entrance into Prince of Wales College and Normal School in Charlottetown (the capital) in a course which corresponds to that of the first two years of a high school. All the schools are supported by legislative aid and dis-

trict assessment, of which the former constitutes about three-fourths of the expenditure. No special grant is made for high school purposes. Whatever is paid extra comes by voluntary vote of the rate-payers of the district.

Manitoba.—In Manitoba, a recently settled province, the high school work is done in intermediate schools, of which there are 46 with 124 pupils, and in collegiate institutes, of which there are three, with 1,160 pupils. The intermediate schools are elementary schools with a high school grade. They do general work and prepare for third and second class non-professional teachers' certificates, but they rarely take up the languages. Such schools receive a special legislative grant of \$300. The collegiate institutes at Winnipeg, Brandon, and Portage la Prairie, in addition to the high school work by the intermediate grades, prepare for first class certificates and matriculation into Manitoba University with occasionally the work of the first year. (See MANITOBA — EDUCATION.) The legislative grant to these three schools is a liberal one, \$8,400 being distributed on bases that recognize their efficiency. Principals of intermediate schools must hold first class certificates; principals of collegiate institutes must in addition be university graduates. The assistants also of both classes of schools must hold professional certificates.

Northwest Territories.—The territories have not as yet developed a high school system. This work is done in grades six, seven and eight of 16 of the elementary schools, with an attendance of 88 in the rural districts and of 493 in the towns and villages. Grade six prepares for third class certificates, grade seven for university pass matriculation and second-class certificates, and grade eight for senior matriculation or the first year examination of the University of Manitoba and for first class certificates. When the languages are taught the principals are university graduates who have had a course of training in a normal school or college. These schools are supported by local taxation and by liberal legislative grants distributed on various bases in accordance with their size and efficiency. A private college has been established at Edmonton (Methodist), that does matriculation and first year work, and there are others at Calgary and Kamloops (both Presbyterian), but as yet these have not developed regular high school courses.

British Columbia.—In this, the most westerly province, there are 8 high schools with 856 pupils and 27 teachers, of whom 17 belong to the high schools at Vancouver and Victoria. (In 1903 two more were established.) These schools do the usual work of the other Dominion high schools. Vancouver high school and college, however, has two divisions which take up the first and second years' courses of McGill University (q.v.) (Montreal) with which this school and Victoria high school are affiliated and which conducts the examinations of the university grades. In cities where high schools are in operation and where the buildings and accommodations are satisfactory to the council of public instruction, a special legislative grant of \$300 is made for each teacher employed. In this province not only is the school system non-sectarian, but no clergyman is eligible for the position of superintendent, inspector, teacher, or trustee. The Methodist Church maintains Columbia College at New Westminster. This college has affiliation relations with Toronto University

CANADA — HIGHER EDUCATION

and does both secondary school work and the work of the first year of the university, the examination papers being sent from Toronto and valued by the university examiners. See CANADA — PRIMARY EDUCATION; CANADA — HIGHER EDUCATION; CANADA — CATHOLIC EDUCATION; CANADIAN UNIVERSITIES; EDUCATION; EDUCATION IN LATIN AMERICA; EDUCATION IN THE UNITED STATES; EDUCATION, CATHOLIC; EDUCATION, SECONDARY.

JOHN SEATH,

Inspector of High Schools and Collegiate Institutes for Ontario.

Canada — Higher Education. The history of higher education in Canada is by no means a homogeneous development in all the provinces. Each province, possessing its own machinery of local government and peculiarities of social and economic condition, has, as might be expected, evolved its own system of higher education. It is, therefore, the more remarkable that the beginnings of university education were almost identical in all the older provinces. This was due to the enlightened policy of the British government, which through the executive heads of the colonies began very early to make provision for future educational needs. In Upper Canada (now Ontario) and New Brunswick this provision took the form of an endowment out of Crown lands for the purposes of higher education. In Nova Scotia, already a self-governing colony, the Legislature was encouraged to devote a special grant of money to establish a university and to make an annual appropriation in support of it thereafter, while the Imperial Parliament endorsed this action by voting much more substantial sums both for establishment and for annual maintenance. In Lower Canada (now Quebec) a proposal was made to create an undenominational state university, but the uncompromising hostility of the Roman Catholic Church to the idea prevented it from being carried out. Thus in each of the four colonies or provinces which at the end of the 18th century made up the settled portion of British North America the policy was inaugurated of establishing State universities, either with large land endowments or with the pledge of support by the provincial Legislature. The next stage was also alike in all the provinces of older Canada except Lower Canada. In these a narrower view prevailed, and the State college in each, when established, discriminated in favor of the Church of England against other religious denominations. It was an attempt to implant in the colonies the English institution of an established Church, but the conditions in Canada were very different from those in England; the Church of England was numerically hardly stronger than the Presbyterian, Methodist, or Baptist bodies separately, and certainly no exclusive right to control the State universities should have been given. The other denominations accordingly, seeing the doors of the State institution closed to their members, or open perhaps but with reservations in favor of a rival Church, established their own institutions of higher education. Thus, instead of a single well-supported university in each province there were several universities of a small calibre, none of them, not excepting the State university, coming up to the standard that had been anticipated when the policy of a single State-supported institution

for each province was framed. In course of time the disadvantages of division became more apparent. The denominational character of the State universities was altered and negotiations for alliance were seriously begun. Up to the present time these negotiations have had no result in Nova Scotia or New Brunswick. But in Ontario a third stage has been reached, and the movement to combine resources has met with partial success. In western Canada the history of higher education is different. Profiting, perhaps, by the experience of the older provinces, the State university in Manitoba has been established under conditions that prevent it from being controlled in the interests of any denomination, and at the same time the foundation of denominational rivals has been guarded against. A State university for the Northwest Territories has just been established by act of the Legislature, and it is probable that it will develop on similar lines.

Nova Scotia.—Taking each province in turn, for a more detailed account, we begin with Nova Scotia, the earliest settled of the English-speaking provinces of Canada. The first attempt at establishing a university was made by act of the Legislature in 1789 incorporating King's College at Windsor, where a seminary had been founded a year before by legislative aid. A grant of £500 for a site was also made and an annual appropriation of £400 for maintenance. In the following year the British Parliament gave £4,000 in further aid of the infant institution. It does not appear that actual university powers were obtained until 1802, when a royal charter was granted. At the same time an annual subsidy of £1,000, which was not discontinued until 1835, began to be made by the British Parliament. The charter gave control of King's College to the authorities of the Church of England in the province, and at the beginning of its career the governing body unwisely restricted to members of that Church the right of entering the college as students, thus completely establishing the sectarian character of the State institution. A majority of the inhabitants of the province were now debarred from sharing in the benefits to which they had looked forward, and agitation began for a freer system. In response to this demand Dalhousie College was founded at Halifax in 1821 out of funds at the disposal of the governor for provincial purposes. Attempts at fusion of the two State-endowed colleges were subsequently made from time to time but without success. It was as a result of the refusal in 1835 of the governors of King's College to surrender their charter and amalgamate with Dalhousie College that the imperial grant of £1,000 was withdrawn. Dalhousie College, though founded in 1821 and soon afterward provided with a building, was not opened for academical instruction until 1838, when sufficient funds had accumulated to enable a beginning to be made. In 1841 university powers were conferred by act of Legislature and control was vested in a board appointed by the lieutenant-governor. But a similar mistake had been made as in the case of King's College, and Presbyterian influences had been allowed to preside at the organization in 1838. The Baptist body, therefore, seeing one of the State institutions avowedly under Anglican control, the other practically Presbyterian, pro-

CANADA — HIGHER EDUCATION

ceeded to establish a college of its own at Wolfville. It was named Queen's College, and was formally opened in 1839. The act of incorporation conferring university powers was not passed however until 1840, and another act in 1841 changed its name to Acadia College, which it still retains, with the alteration of "university" for "college." The Roman Catholic Church, which had always stood apart from any system of higher education under State control, established somewhat later St. Francis Xavier's College at Antigonish, in the year 1855. Under varying conditions higher education in the province continued to be carried on for a number of years by the institutions named, two of them being the recipients of government bounty. Dalhousie College, indeed, for want of funds was closed from 1845 to 1863, and on reorganization at the latter date was given a strictly non-denominational character. But the hope of uniting all the existing colleges in a single State university had not been given up. In 1876 an act of the Legislature established the University of Halifax, which should examine and confer degrees upon candidates sent up by the colleges. The latter, however, gave it no support, and continued to exercise their university functions. In 1881 the Legislature withdrew its financial support and at the same time discontinued the annual grant which had hitherto been made to King's College. University federation in Nova Scotia had proved a failure, and no scheme to that effect has since been proposed. At present Nova Scotia possesses five institutions with university powers, a second Roman Catholic college, Saint Anne's College, in the county of Digby, having been established in 1800. The numbers of members of faculties and of students in the several colleges are as follows for the latest year for which statistics have been issued:

character of the new college was strongly opposed by other religious denominations. In 1842 the Wesleyan Methodists succeeded in establishing an institution of their own, Mount Allison Academy, at Sackville. At first only a secondary school, it received in 1858 university powers, which came into operation four years later. Meanwhile agitation against the existing constitution of the provincial college began to bear fruit. In 1845 religious tests were abolished, and in 1859 reorganization on a non-denominational basis was effected and the name changed to University of New Brunswick. A third university for the province was added in 1864, when the Roman Catholic College of St. Joseph was founded at Memramcook. The latest statistics (1903) for the three universities of the province are as follows:

	Prof. etc.	Stud.
University of New Brunswick.....	7	193
Mount Allison College.....	10	175
Saint Joseph's College.....	10	48

Quebec.—Before the cession of Canada to Great Britain in 1763 the control of all education in the French colony had been in the hands of the Roman Catholic religious orders. Laval, first bishop of Quebec, had established the Grand Séminaire at Quebec in 1663, which is perpetuated as Laval University of the present day. The Grand Séminaire, however, was not a university, but a theological training college for the priesthood. The first suggestion of a university in the province was made in 1789, when a committee of the executive, in reporting on the condition of education in the province of Lower Canada (now Quebec), recommended the establishment of a non-denominational university at Quebec. The opposition of the Roman Catholic bishop prevented the suggestion from being carried out, and though the hope was long cherished that the project would be

New Brunswick.—As early as 1786 an endowment of 2,000 acres near Fredericton, the capital, was set aside for the foundation of a provincial Academy of Arts and Sciences, which became incorporated in 1800 as the College of New Brunswick. In 1805 an act was passed authorizing an annual grant of £100 in addition, which was subsequently increased from time to time up to \$8,844, at which sum it has stood since 1829. In 1828 the provincial charter was surrendered and a Royal charter obtained incorporating the institution under the favorite name of King's College, with university powers. In the following year a suitable building was erected and academical work begun. The Royal charter contained, however, the same provision for Church of England control which had already begun to work so disastrously in Nova Scotia, and almost from the moment of its inception the sectarian

renewed under more favorable conditions, no subsequent proposal to that effect was ever formally made. It was left to private enterprise to establish the first university in Lower Canada. In 1813 the Hon. James McGill of Montreal died, leaving by will a piece of land as a site for a university or college and the sum of £10,000 for maintenance. A Royal charter was obtained in 1820, but the college, bearing its founder's name, was not opened until 1829, and on the day of its inauguration the Montreal Medical Institute was united to it as its medical faculty. For more than 20 years the college had a precarious existence, its expansion being, to a certain extent, hampered by the constitution of its governing board, but a new charter was obtained in 1852 entirely freeing it from official control. The history of McGill University (q.v.) since that time is a record of steady improvement. It is

CANADA — HIGHER EDUCATION

not identified with any religious body, nor is it dependent upon any form of state assistance. It owes its present position as one of the leading universities, not only of Canada but of the continent of America, to the generosity of the merchant princes of Montreal, and to the wise and able guidance of Sir J. W. Dawson, principal from 1855 to 1893, and of his successor, Dr. Peterson.

The second university to be established in the province in the interests of the English-speaking inhabitants was the Church of England institution at Lennoxville, called Bishop's College. It was incorporated in 1843, but a Royal charter conferring university powers was not obtained until 1853. In the previous year, 1852, a Royal charter had also issued to the corporation of the Grand Séminaire of Quebec empowering it to confer degrees and exercise other university functions, under the name of Université Laval. The university thus established remains the sole Roman Catholic university of the province, with faculties of divinity, law, medicine, and arts, having affiliated colleges and seminaries in various towns, and an integral branch of itself at Montreal under the name of "Succursale de l'Université Laval." Other colleges in the province without separate university powers, but carrying on university instruction, are Morrin College at Quebec, founded in 1850 under Presbyterian control, affiliated to McGill University since 1862, and St. Mary's College at Montreal, under control of the Jesuit order, incorporated in 1852, and since 1880 entitled by papal brief to confer the degrees of Laval University. There are numerous Roman Catholic colleges affiliated to Laval University, some of them of considerable antiquity. The oldest are Saint Raphael's College at Montreal, established by the Sulpicians in 1773; those at Nicolet, founded in 1804; Sainte Hyacinthe, in 1812; Sainte Thérèse, in 1824; Sainte Anne de la Pocatière, in 1827; and L'Assomption, in 1832. The higher education given at these colleges is chiefly theological. The statistics for 1903-4 of the three universities of the province are as follows:

1840 the charter for Queen's College at Kingston, the Presbyterian institution, was secured and the college was opened in 1842. In 1841 the Methodist theological seminary already established at Cobourg was reorganized as a university. It was not until after the establishment of these rival institutions that the work of teaching was begun in King's College, in 1843. Continued political agitation against the privileges accorded to members of the Church of England in the state university brought about a complete reconstitution in 1849, when the non-sectarian character of the University of Toronto (see TORONTO, UNIVERSITY OF), as it was then named, was firmly established. The chief result of this overthrow of Anglican control was the establishment in 1852 of a strictly Anglican university, Trinity College, through the exertions of the same bishop who had been instrumental, 25 years earlier, in procuring the charter for King's College in the interests of his communion. The only apparent effect of broadening the character of the state university had been to erect another rival. In 1853 reorganization of the University of Toronto took place again on a narrower basis; the teaching faculties of law and medicine were abolished, and the faculty of arts was constituted a separate corporation as University College, while the University of Toronto itself became, after the pattern of the University of London of the day, a mere examining and degree-conferring corporation. The next 30 years saw five more denominational colleges founded in the province, Albert College at Belleville in 1866 (Wesleyan Methodist); Ottawa College in 1866 (Roman Catholic); Regiopolis College at Kingston in 1866 (Roman Catholic); the Western University at London in 1878 (Church of England); and McMaster College in 1881 (Baptist), the last-named at first a theological college only, but in 1887 given full university powers. In spite of this multiplication of small colleges with university powers, a change of sentiment was gradually coming about. The needs of modern education in science called for considerable expenditure on laboratories and instruments. A

Ontario.—In Upper Canada (now Ontario) an endowment of 500,000 acres of Crown lands was set aside in 1798 for the purposes of higher education in the province, but not until 30 years later, in 1827, was a Royal charter obtained for the establishment of a university upon this endowment. The name of the institution, as in the provinces of Nova Scotia and New Brunswick, was King's College, and the unfortunate example set by the older provinces was also followed in providing for the Church of England control. The Methodist and Presbyterian bodies protested against the terms of the charter, and some modifications were secured in 1837, before actual organization of the college, but the concessions made were not sufficient, and these denominations proceeded to establish colleges of their own. In

strong state university in alliance with the denominational institutions could adequately supply the instruction in scientific subjects for them all, while they in turn might maintain their own faculties for teaching languages, philosophy, history, and theological subjects. The federation idea, as it was called, rapidly gained ground, and in 1887 an act of the legislature was passed reorganizing the University of Toronto once more, this time to broaden instead of to narrow the scope of its activity. The scientific subjects and one or two others were assigned to a teaching faculty of arts, the instruction being free to all students of the federated colleges. These, including the state college (University College), were concurrently to give instruction in languages and literature and certain branches of

CANADA — HIGHER EDUCATION

philosophy and history. Teaching faculties of medicine and law were also established in the university. Under this arrangement Victoria College, the Methodist university, became a federated institution in 1891, renouncing its right to confer degrees in any faculty except divinity; and Trinity College, the Church of England university, has taken similar action within the last year (1903). In pursuance of the policy outlined when the federation plan was under discussion, the University of Toronto has added largely to its facilities for teaching the sciences. In 1901 the School of Practical Science, a provincial school of engineering and applied chemistry, founded in 1878, was incorporated in the circle of University institutions by its staff of teachers becoming the faculty of applied science and engineering of the University of Toronto. The provincial colleges of dentistry, pharmacy, agriculture, and veterinary science have been affiliated, and the University holds examinations and confers degrees upon their students. Colleges of music have also been affiliated, and local examinations are held and degrees conferred in music. The expansion of the University of Toronto since 1887, as outlined above, is the most notable event in the history of higher education in Canada. It has been the justification of the far-sighted policy of the British governors of the colony at the end of the 18th century, when they made provision for a single university in each province to be the head of a state-supported system of education. Within a comparatively few years the University of Toronto has developed into the largest university of Canada and has reached the front rank of universities on the continent of America. Its importance is measured not only by the number of its students, but by the place which they take in the estimation of the academic world.

Victoria College and Trinity College having both federated with the provincial University, there remains independent but one of the three early rival denominational institutions, Queen's University (q.v.) at Kingston. Although still recognized as the Presbyterian university of the province it imposes no religious tests upon professors or students. Of the other denominational colleges founded later, Albert College has resigned its university powers and become affiliated with the University of Toronto, Regiopolis College was closed in 1869, and Ottawa College became the Catholic University of Ottawa in 1889.

The statistics of the existing universities of the province for 1903 are as follows:

with the sole power of conferring degrees in arts, law, and medicine in the province; degrees in divinity may only be conferred by colleges affiliated with the university. Up to the present year the university has been an examining and degree-conferring body only, all teaching being left to the affiliated colleges. Recently, however, a grant of land has been made by the provincial government for the erection of a building for purposes of instruction in the departments of science and for a university library. Three university lecturers in science have already been appointed, so that a new departure in the university system of the province has fairly begun, the further development of which will be watched with great interest. There are at present four arts colleges and one medical college affiliated with the University of Manitoba. Saint Boniface College is a Roman Catholic institution and was established as a small school so early as 1818; Saint John's College (Church of England) was founded in 1866; Manitoba College (Presbyterian) in 1871; Wesley College (Methodist) in 1888; Manitoba Medical College in 1883. All are in Winnipeg except Saint Boniface College, which remains at the town of Saint Boniface, where it was first established. The numbers of members of faculties and students are as follows for 1903:

University of Manitoba — Students registered in Arts, 184; in Medicine, 100; in Law 18.

	Faculty	Students
Saint Boniface College.....	23	187
Saint John's College.....	10	52
Manitoba College	12	177
Wesley College	12	163

Up to the present time no university has been organized in western Canada except the University of Manitoba. Local examinations are conducted in various centres of British Columbia by the University of Toronto and by McGill University. In the chief centres of population in that province denominational colleges and schools are found, such as Vancouver and Columbian colleges, which undertake some teaching of a university course in arts. The legislature of the Northwest Territories passed an act in the autumn of 1903 to establish a territorial university. The constitution of the governing body is much the same as obtains in the University of Manitoba or the University of Toronto. The power to affiliate colleges and to establish faculties is given to the university senate; but this body has not yet commenced its functions. See CANADA — CATHOLIC EDUCA-

Manitoba.—Higher education in Manitoba is of recent date. By act of legislature in 1877 the University of Manitoba (q.v.) was established,

tion; CANADIAN UNIVERSITIES; HIGHER EDUCATION; UNIVERSITIES. JAMES LOUDON, President of University of Toronto.

CANADA — CATHOLIC EDUCATION

Canada — Catholic Education. By the British North America Act of 1867 (see CANADA — CONFEDERATION) it was enacted, "That the local legislature of each province shall have power to make laws respecting education saving the rights and privileges which the Protestant or Catholic minority in both Canadas may possess, as to their denominational schools, at the time when the Union goes into effect." As therefore education belongs primarily to the different provinces, we shall consider each province separately.

Ontario.—One of the earliest tasks undertaken by the United Legislature of Upper and Lower Canada, in 1841, was the improvement of the primary schools. An act was passed in that year providing for denominational schools in both provinces. Taxes were levied uniformly upon all; and these taxes, with the legislative grant, were divided between the two classes of schools in proportion to the number of their supporters. Separate, or parochial, schools were not authorized in towns or cities, where a joint board consisting of an equal number of Catholics and Protestants controlled all schools. To the Catholic section was given full jurisdiction over Catholic schools. This act, on account of the dissimilar educational interests in Upper and Lower Canada, soon proved unsatisfactory. Two years afterward it was repealed, and an act for each of the Canadas was passed, duly recognizing the principle of religious education. The difficulty of adjusting the demands of Catholics, and of legislating for a systematic respect for all concerned, continued for many years with much acrimony, which religious, racial, and political differences tend so seriously to aggravate. A new turn was given the controversy in 1846, when the provincial secretary was relieved of his duties as chief superintendent of education, and a person appointed by the governor of Upper Canada for this position. The first, and indeed only, chief superintendent of education in Upper Canada was the Rev. Egerton Ryerson (see RYERSON, A. E.). The contest was in no way diminished by thus withdrawing the chief from the ministerial ranks and legislative hall. It continued unabated until 1863, when what is known as the Scott Act was introduced and passed. This act, being in operation at the time of confederation, remained the anchorage and basis for parochial education. The following are among the chief benefits of the act: (1) Permitting the union of adjacent rural sections, and allowing any Catholic within three miles of the school to become a supporter; (2) Requiring of lay teachers the same qualifications as for common schools; (3) Giving a share in all public appropriations for elementary education. The schools were at the same time made subject to inspection and to such regulations as the chief superintendent might impose. After remaining unchanged for 14 years some amendments to this act were introduced in regard to the trustees and supporters of the Catholic schools. One important clause was introduced, providing that a "separate school may become a model school for the preliminary training of Catholic teachers." The inspection of separate schools in cities and towns was confided to the high school inspectors, while in rural districts the duty devolved upon public school inspectors. The work of

the former increased so much, and the incompatibility of inspecting schools so different gave no satisfaction. The office of Separate School Inspector was created in 1882, and James F. White appointed. Since that time two others have, on account of the increase of work, been added, so that separate schools are regularly visited and systematically inspected. We quote the following points in regard to the support and teachers' qualifications from 'The School System of Ontario,' by G. W. Ross: "Separate schools are supported (a) by a grant from the provincial treasury, paid upon the basis of average attendance; (b) by a rate levied by the trustees upon the taxable property of the supporters of the school; (c) by fees from the pupils attending separate schools." Practically speaking, no fee is charged. "There are two classes of teachers employed in separate schools: one class, known as lay teachers, who are subject to the same examinations and receive their certificate of qualification in the same way as public school teachers; the other class known as religious teachers—members of religious communities—who are not, by the Separate School Act, subject to any examination." It is just to add that the religious communities are striving earnestly and with marked success to have their postulant and young members qualify in the normal and other technical schools. With regard to religious instruction, the separate schools are supervised by the clergy. "The Department of Education lays down no regulations and exercises no jurisdiction upon the subject."

TABLE OF ROMAN CATHOLIC SEPARATE SCHOOLS FOR THIRTEEN YEARS — 1800 TO 1902

The work of secondary and higher education devolves upon the voluntary institutions conducted by the religious communities. These institutions, chiefly residential, range from the academy and select school to the college and university. Their programme of studies includes a liberal education based upon the programme of studies provided for by public institutions of a similar grade. Throughout Ontario there are 36 academies for young ladies. There is a Catholic university at Ottawa under the direction of the Oblate Fathers. The Most Rev. the Archbishop of Ottawa is apostolic chancellor. At present the Very Rev. Father Emery, D.M.I., is rector. There are faculties in theology, arts, and law, and a commercial department. The Grand Seminary for the Diocese of Ottawa is in connection with the University, as is also Saint

CANADA — CATHOLIC EDUCATION

Joseph's College. It was unfortunately destroyed by fire on 1 Dec. 1903. The new plans (1904) foreshadow a building of exquisite design and magnificent proportions, which, when completed, will admirably fulfil its purpose as an educational institution and be an ornament to the capital of the Dominion. In Toronto, the educational centre of Ontario, is Saint Michael's College, in federation with the University of Toronto. It was founded in 1852, and is under the charge of the Fathers of the Community of Saint Basil. It conducts the course of Catholic philosophy and history as prescribed by the University of Toronto. Its course includes a commercial, a classical, and a philosophical course. The Basilian Fathers also conduct a large college at Sandwich, just opposite Detroit, entitled Assumption College. This institution was first founded in 1855; but it was not until 1870 that it was entrusted to the Basilian Community, under the superiorship of the Rev. D. O'Connor, now archbishop of Toronto. The present rector of the College is the Very Rev. Robert McBrady. The Diocese of Kingston has Regiopolis College, whose history is in two volumes, the first closing in 1869; the second opened in 1896, when, by the provision of the late Most Rev. James Vincent Cleary, archbishop of Kingston, an endowment was secured for its re-establishment. At present the work of the College terminates with the requirements for the honor matriculation examinations in either the University of Toronto or of Queen's University, Kingston. Saint Jerome's College is situated in the town of Berlin, in the county of Waterloo. It was established by the Very Rev. Father Louis Funcken, a member of the Congregation of the Resurrection. Originally it was intended for the education of young men of German descent. Its usefulness has widened, its professors have increased, and its students multiplied. Since its start in 1865 over 100 priests and a large number in the secular professions are counted among its graduates.

Quebec.—Catholic education in Quebec, the pioneer province of the Dominion, clusters around the Seminary of Montreal and the University of Laval at Quebec, whose early foundations are associated with the dawn of civilization and evangelization of Canada by the intrepid religious of France. The former was founded in 1649, and the latter in 1663 as a Grand Seminary, by François de Laval (see LAVAL-MONTMORENCY, F. X. DE). Even before—in 1615—four Recollect Fathers taught an Indian school on the banks of the Saint Charles. And in 1632 the Jesuits established a college in Upper Town (Quebec), which three years after began to receive pupils. The first school for girls in the colony was the Ursuline Convent of Quebec. This was followed in 1653 by the establishment of a convent in Montreal by Margaret Bourgeois, the saintly foundress of the Sisters of the Congregation. These institutions still remain. Progress marks their history—enlarged buildings and commodious show their success and the confidence in which their teachers are held; but the discipline and spirit is much the same, exercising a most beneficial influence of contentment and steadiness in an age of change and restlessness. Their further advance is marked by their multiplication. In 1773 the Sulpicians founded Montreal College, which they first named Saint Raphael's College. The Petit Séminaire of Que-

bec had been founded over 100 years before (1668). This first served as a preparatory school to the Jesuit College, and afterward took its place. Nor should it be supposed that under the French régime primary education was neglected. Chauveau says: "From the very beginning a large number of those who settled in the country had received a fair education, and the old parish registers still preserved at Quebec and Montreal show that a large proportion of the population could write."

At the beginning of the 19th century the number of schools in operation was 1,321, with 36,000 pupils. This does not include colleges, academies, or kindred schools. Garneau gives a total of 57,000. To advance primary education, Lieutenant-Governor Milnes, in 1801, urged the legislature to vote land, the revenue of which should be expended on education. An act was therefore passed, and the government formed a corporation for educational purposes under the name of the Royal Institution. This institution was neither successful nor satisfactory. After a trial of 20 years it proved so detrimental that Lord Dalhousie entertained the idea of forming two distinct Royal Institutions. This idea was not carried out. Eventually, however, but only after many years—in 1875, and when the Council of Public Instruction had taken the place of the Royal Institution—this idea was modified by the council being composed of two committees, one for Catholics and the other for Protestants. In spite of difficulties arising from legislation and from the disturbed state of the country in 1837–8, education advanced through the redoubled efforts of the clergy. The following colleges owe their existence to this period: Nicolet, founded in 1804; Saint Hyacinthe, in 1812; Sainte Thérèse, in 1824; Sainte Anne de la Pocatière, in 1827; and L'Assomption in 1832. Two Catholic normal schools were established in 1857: that of Jacques Cartier at Montreal, and Laval at Quebec. The support of these normal schools is taken partially from the superior education income fund and the common school fund. They are regulated by the Roman Catholic committee of the Council of Public Instruction, with the approval of the lieutenant-governor in council. These regulations include: (1) their management; (2) the terms and conditions upon which students shall be received and instructed; (3) the course of instruction to be followed; (4) the manner in which registers and books shall be kept; and (5) diplomas granted to students. The professors, directors, and principals are appointed or removed by the lieutenant-governor upon the recommendation of the Catholic committee of the Council of Public Instruction. In 1852 the Seminary of Laval enlarged its courtyards by securing a royal charter as a university. Its privileges were further extended in 1876 by Pope Pius IX., who bestowed upon the University canonical status as such, having for its protector at the Holy See the Cardinal Prefect of the Propaganda. The supervision of "faith and morals" is entrusted to a superior council of the University consisting of the archbishops and bishops of the province of Quebec, under the presidency of the archbishop of Quebec, who is the apostolic chancellor of the University. The ordinary council of the University consists of the rector, the directors of the Seminary of Quebec, and the three senior professors of each of the faculties of theology, law, arts, and medicine.

CANADA — CATHOLIC EDUCATION

The superior of the Seminary is *ipso facto* rector of the University; and the visitor of the University is always the Catholic archbishop of Quebec. This council has full authority concerning the government and advancement of the University. It has power to nominate the professors of the faculties of law, medicine, and arts, and, upon sufficient and just cause, to revoke and annul its own nominations. It has the right to propose names suitable for the faculty of theology as professors, but it is the visitor who makes these appointments. The University is maintained by the Seminary of Quebec, which is still obliged to add more than \$10,000 a year in order to make up the University deficit. A Succursal to Laval was established at Montreal some years ago with the same faculties of theology, law, arts, and medicine. The faculty of theology consists of the Grand Seminary of Montreal, which is under the direction of the priests of Saint Sulpice. The functions of the University are, in this question, limited to the granting of certificates after special examinations at the Grand Seminary. "The public schools of the province of Quebec are divided into elementary schools, model schools, and academies. Some of the public schools are said to be 'under control,' the others are said to be 'subsidized.' Schools under control are those whose teachers are engaged and paid by the school commissioners or trustees." The elementary school course consists of four years, and corresponds to the first four or five years of the public schools in the United States. According to the report of the superintendent of public instruction the Roman Catholic schools under control in 1901 contained 176,799 Roman Catholic pupils, and 587 Protestant pupils. Of these 171,446 were French and 5,940 were English. The next higher grade of school is the model school, which may be established by the union of two or more municipalities. In these cases the school is under the control of the municipality in which it is situated. Next to these are ranked the academies, which have their official origin in a petition signed by delegates who are chosen by the chairmen of the boards of trustees desiring the academy. This petition, addressed to the Council of Public Instruction, is, upon the approval of the Catholic committee of the Council, forwarded by the superintendent of education to the lieutenant-governor, with whom rests the final authorization. When established, an academy is under the control of three trustees. To provide for the building and maintenance of an academy a limited amount may be raised by a tax upon the taxable real property of the school municipality. Each academy fulfilling the required conditions is entitled to a share in the legislative grant for superior education. The course includes, besides religious instruction, grammar, composition, algebra to equations of the second degree, bookkeeping, history, political economy as applied to Canada, and elements of philosophy, geology, and botany.

STATISTICS OF ROMAN CATHOLIC MODEL SCHOOLS AND ACADEMIES, FROM THE REPORT OF EDUCATION FOR 1902.

I. MODEL SCHOOLS.

Number of schools under control of school commissioners	367
Number of pupils attending the above schools, 62,314	
Number of schools partly under control and partly independent	7

Number of pupils.....	902
Number of independent schools.....	137
Number of pupils.....	14,957
Total number of schools.....	511

Students in theology	124	300
Students in law	90	108
Students in medicine	108	180
Students in arts	98	48
Students in pharmacy	6	...

Nova Scotia.—There are two means used by Catholic educationists in Nova Scotia for keeping in touch with the public school system. The first method is by ranking an institution as a county academy. "The county academy is that high school within the county which receives a special grant on account of its agreement to admit free any students from the county who are able to pass the county academy entrance examination." The Saint Francis Xavier College at Antigonish and the French College of Sainte-Anne in the county of Digby avail themselves of this opportunity, and function under the law as county academies, receiving therefor a due share of the academic grant. Both these universities have the power of conferring degrees. Saint Francis Xavier College was founded at Antigonish in 1854, and had for its first president the Rev. Dr. John Cameron, afterwards bishop of Antigonish. Its president for 1902-3 was the Rev. Dr. Alexander Thompson. The College of Sainte-Anne was founded in 1890, and in 1892 was incorporated and chartered as a university. The university was destroyed by fire in 1898, but a larger and more commodious has replaced it. The archbishop of Halifax is (*ex officio*) chairman of the board of governors. The fact that the trustees of public schools "can rent the school rooms of denominational schools, gives rise to the second method by which several Catholic schools are affiliated to the public school system. In some districts the due consent of the town councils and school boards in these localities having been obtained, several Catholic schools were thus affiliated, their work acknowledged, and "they participated in the public grant." The chief voluntary educational institutions other than those already mentioned,

CANADA — PUBLIC EDUCATION

are Saint Mary's College, Halifax, of which Rev. Edmund Kennedy is superior; La Salle Academy, Halifax; Convent of the Sacred Heart, Halifax; and Saint Vincent Academy. The following educational statistics in Halifax and Antigonish are taken from the Church 'Directory' for the year 1904:

HALIFAX

College and academies for boys,	2,	students	210
Academies for young ladies.....	4,	students	420
Parochial schools	10,	pupils in the city—	
		Halifax	3,750

ANTIGONISH.

College	1,	students	150
Boarding schools for young ladies	4,	students	610
Parochial schools	11,	pupils	2,700

New Brunswick.—Catholic education in New Brunswick is more the history of devotion and struggle than of an organized system. At the time of the passing of the British North America Act (1867), Catholics had their schools established and maintained in their more thickly settled districts. These received legislative grants in proportion to local contributions. Matters went on quietly and satisfactorily until 1871 when an act was passed taxing all the property of the country for schools of a non-sectarian character. This act aroused a strong feeling among the Catholics, who claimed that to them it meant double taxation for school purposes, that thus their condition was worse than before confederation. The courts were appealed to, the Dominion Parliament asked to intervene, and the Crown petitioned. As a result, although the act was maintained, some concessions were made by the legislature in 1875. "Local trustees in cities and towns were permitted to lease from the authorities of the Roman Catholic Church the buildings in which the separate schools had up to that time been conducted, to open public schools in these buildings, and to employ as teachers in such schools members of religious communities and others having the confidence of the Catholic clergy, provided, however, that all such teachers should undergo examination in the regular way as to their qualifications and receive a license from the Board of Education." Under this arrangement matters, if not altogether satisfactory, quieted down. Schools increased in number and advanced in progress. Large schools exist in most of the missions. Besides 12 academies for the higher education of young ladies, there are two colleges for the classical and secondary education of young men. Saint Joseph's College at Memramcook, under the direction of the Fathers of the Holy Cross, has both a classical and a commercial department, and ranks as a university in conferring degrees. Within the past few years (1899) a college has been opened at Caraquet, conducted by the Eudist Fathers.

Prince Edward Island.—In Prince Edward Island the Catholic institutions of education are all voluntary. They consist of eight academies for girls and several other schools located in various parts of the island. There is one college—Saint Dunstan's—situated at Charlottetown, in charge of the secular clergy. The Sisters of Notre Dame conduct a school in the Magdalen Islands.

Manitoba.—In the early days of Manitoba

the work of Catholic education was as zealously carried on as circumstances would permit. Settlements were sparsely scattered over a vast extent of country; teachers were few, and what few there were shared poverty and hardship, the common lot of all. The first legislation upon education in the province was passed in 1871. So far as Catholic education is concerned, the main features of the act were as follows: (1) The Central Board of Education, in whose power the whole education was placed, was divided into two sections—one Catholic, the other Protestant, equal in number. (2) Between these two sections the annual legislative grant was equally divided. (3) It was arranged that 12 of the school districts into which the province was divided should be Catholic schools, under the Catholic section of the Central Board. This act was denominational in its principle and action. All was reversed by the Act of 1890. Only one school was recognized. The instruction was non-sectarian; and the taxes for the support of these schools were raised from all the rate-payers alike. This change produced a bitter feeling and roused prolonged opposition. The Catholics of Manitoba strove by every legitimate means in their power to effect a change. At length the Federal and Provincial governments agreed to certain measures calculated to diminish the grievances. An ablegate, Mgr. Merry del Val, was sent out by the Holy See to report upon the whole question. After receiving the report the Sovereign Pontiff wrote in an encyclical: "We have no doubt that these measures have been inspired by a love of fair dealing and good intention. But we cannot conceal the truth. The law made to remedy the evil is defective, imperfect, insufficient." The Catholic schools of the diocese of Saint Boniface number 126, attended in all by about 5,000 children. There is at Saint Boniface a large college conducted by the Jesuits, in affiliation with the University of Manitoba.

Northwest Territories.—In the Northwest Territories the principle of separate schools was recognized. The statistics give for 1898, 44 Roman Catholic public schools and 11 separate school districts, with a total attendance of nearly 2,000.

Catholic Industrial Schools.—A great deal has been done for children who are placed in these schools. Provincial help is given in both Ontario and Quebec. Besides these provincial institutions there are many industrial schools for the education of Catholic Indians, conducted by religious, and supported by public aid. See also EDUCATION, ROMAN CATHOLIC; CANADA—RELIGIOUS CONDITION.

J. R. TEEFY, LL.D.,

President of Saint Michael's College, Toronto.

Canada—Public Education. Under the provisions of the British North America Act of Control of public education in Canada is vested in the provincial governments. The position of dissident denominational schools is, it is true, specially safe-guarded under the act (30-31 Vict. c. 3 § 93), and on their behalf the Dominion Parliament may interpose remedial legislation, but with this exception the whole organization, conduct, and maintenance of education lies with the provinces. At the time of confederation the provinces then existing had already in operation a system of free elementary schools, which has since been expanded into the present effi-

CANADA — PUBLIC EDUCATION

cient organization. The figures of the census of 1901 show the high standard obtained in public education in Canada. In a population of 4,728,631 persons over five years old, only 14.4 per cent are illiterate; in the Province of Ontario of the persons over five years old, the illiterates number 8 per cent. There are now nearly 1,000,000 pupils in 19,891 primary and secondary schools of Canada, with about 25,000 teachers. Except in the Province of Quebec all but a small fraction of these schools are government institutions. Throughout the Dominion elementary education is free, compulsory, and co-educational, and the schools controlled (within the scope of provincial statutes and regulations), by locally elected trustees. There are provincial secondary schools everywhere except in the Northwest Territories, and provincial universities in Ontario, New Brunswick, and Manitoba. The following table, compiled from the Statistical Year Book of Canada (1903) and the Annual Provincial Reports illustrates the status of public education in the provinces of Canada:

ing, object lessons, etc. Above these are the public schools of the provinces, whose organization (first placed on a comprehensive basis in 1844 by Egerton Ryerson, superintendent of education), owes much to the educational system of the State of New York. Every township is divided by its council into school sections, and for each section, each incorporated village, town, and city there is a board of trustees. The latter are elected by the rate payers, both male and female. Within the provisions of the statutes of the province, and the regulations of the education department, the trustees appoint the teachers, determine the salaries, and provide and maintain buildings and equipment. The provincial government makes an annual grant of money to each school according to the average number of pupils in attendance. For the rural schools the county council adds an equal grant, the township council contributes \$100 (\$150 for a school with two teachers), and the remaining funds needed are raised from the rate payers. In cities, towns, and villages the legislative grant is supplemented by funds raised by the municipal

Provinces	No. of public (primary) schools	Teachers in public schools	Pupils in public schools	Average attendance	Average salaries of teachers in public schools	Public school expenditure per head of population	Percentage paid by provincial government	No. of high schools, collegiate institutes, academies, and grammar schools	No. of pupils in ditto	Total school expenditure	Grants from provincial governments

* Includes 105 independent Roman Catholic Academies and 2 independent Protestant.

For the organization of education it is necessary to consider the provinces separately. Ontario, the most populous of the provinces and the most advanced in matters of education, having largely influenced the educational systems of the other Protestant parts of Canada deserves the most detailed treatment. The system of public education in Ontario includes, kindergartens, public (primary) schools, high schools and collegiate institutes, and a provincial university, the whole forming an organic unit. Kindergarten schools, admitting children between the ages of four and seven, may be organized at the option of boards of school trustees in cities, towns and incorporated villages. There are at present 120 such schools in the cities and towns of Ontario, with an enrollment of 11,300 pupils. The exercises consist of singing, marching, sew-

council. All the public schools are free, and under an act of 1891, trustees are empowered to supply text books either free or at reduced prices. In the uniform course of study prescribed by the education department chief stress is laid on reading, writing, arithmetic, grammar, geography, and drawing. In the upper forms British and Canadian history and commercial subjects are taught; agriculture is taught in rural schools. Periodic talks are given on temperance and hygiene. Only text books authorized by the education department are allowed. Attendance is obligatory for all children between the ages of 8 and 14 years, not attending separate schools and not under efficient instruction at home. The public schools are strictly non-sectarian, but the schools are opened and closed with the reading of the Lord's prayer

CANADA—PUBLIC EDUCATION

and portions of the Scriptures are read daily. The clergy of any denomination may arrange with the trustees to give religious instruction in the school after the regular hours. Any group of five or more heads of families may, upon giving notice to the municipal clerk, cease to pay school rates, and become supporters of a separate school. This privilege may be used by any religious sect or by persons of color; in actual fact, of the 397 separate schools existing in Ontario all but 6 are Roman Catholic institutions. The course of instruction given in the separate schools is almost identical with that of the public schools, with the addition of special religious teaching. Separate schools share in the legislative grant. For secondary education Ontario has an admirable system of high schools and collegiate institutes; these are almost identical in character, the collegiate having a larger and more highly qualified staff, special facilities in regard to apparatus, etc., and receiving a larger government grant. Any high school may become a collegiate institute on fulfilling the requirements. High schools and collegiate institutes are created by municipal and county councils, and managed by elective boards of trustees. The original cost, and the cost of permanent improvements are defrayed by the local authorities. For current expenditure, the provincial government contributes a yearly grant varying according to situation, attendance, etc., but with a fixed minimum. The grants average from \$500 to \$800. The county contributes an equal amount. The remaining expense is met by the municipality. About one third of the schools are free, in the others the annual fee varies from \$2.50 to \$26. A uniform examination is prescribed for admission. A graded series of four forms leads to the uniform "leaving" examinations (Junior and Senior) conducted by the department, on the results of which certificates are granted for public school teachers. The matriculation examination for the provincial university is almost identical with the junior leaving examination. In 1902 there were in Ontario, 134 high schools and collegiate institutes, with 593 teachers and 24,472 pupils. Coeducation obtains in all of them, 12,843 of the registered pupils being girls. The total expenditure was \$769,680. Special attention is paid in Ontario to the uniform qualification and training of teachers. The lowest grade of public school teachers (third class) must pass the high school primary examination (Forms I. and II.) and attend a county model school. Teachers of the second class must pass the junior leaving and attend the provincial normal school. Teachers of the first class must pass the senior leaving examination, and attend the school of pedagogy in Toronto. To hold a position in a high school a teacher must hold a first class public school certificate, or have passed at least equivalent university examinations. For specialist positions in collegiates, higher university standing is demanded, varying according to the subject. Unless by special permission of the department, only the certificates of the universities in Ontario are accepted. At the head of the system is the minister of education, a member of the provincial cabinet.

The problem of public education in the Province of Quebec, owing to the division of the population between the French and English races, and the Roman Catholic and

Protestant religions is one of peculiar difficulty. The difference of creeds has led to the establishment of a dual system of elementary, secondary, and superior schools. The Roman Catholics of the province, numbering (census of 1901) 1,429,186, have 5,180 schools of all kinds, the Protestant population of 219,712 have 964. At the head of the educational system is a superintendent of public instruction with a council of 35 members, both Protestants and Roman Catholics being represented. Within the council are a Protestant committee and a Roman Catholic committee which control the schools of their respective denominations. Each has its elementary, model, and normal schools and academies. In each parish or township there is a board of school commissioners elected by the owners of real estate. These erect and maintain schools, appoint teachers, and levy the school tax, which falls on real property only. But in any such district a dissentient minority, professing a religious faith different from that of the majority, may organize themselves separately, elect a board of trustees, and conduct a school of their own. In the cities and towns there are separate Protestant and Roman Catholic boards of school commissioners. Real estate is taxed for school purposes according to the religious faith of its owners. Attendance at the elementary schools is free and is compulsory for children between the ages of 5 and 16 years. The cost of elementary schools in 1903 was \$2,270,113, of which \$235,000 was covered by the annual grant of the provincial government, and, \$1,935,113 by local taxation.

In each of the three maritime provinces (New Brunswick, Nova Scotia, and Prince Edward Island) there is a system of public elementary schools, normal schools and academies, grammar schools in New Brunswick), whose organization closely resembles that of the Ontario schools. In each province the executive council, acting through its superintendent of education is at the head of the system. The elementary schools are free, coeducational, non-denominational, with compulsory attendance, placed under trustees elected in each school district, and supported partly by provincial, county, and municipal grants, partly by local assessments. In both Nova Scotia and New Brunswick the annual "school meeting" of rate payers which elects the trustees votes the amount of money to be locally assessed. New Brunswick has separate schools for Roman Catholics in the towns and in some French-Canadian settlements. New Brunswick has a provincial university (see article CANADIAN UNIVERSITIES), whose president is adjoined to the executive council in its capacity of board of education. In Prince Edward Island, the Prince of Wales College at Charlottetown is a secondary school with governmental support.

In Manitoba the executive council, or cabinet, is at the head of public education. There is a minister of education. An advisory board, partly appointed, partly elected by the teachers, aids the government in organizing the school curriculum, establishing teachers' qualifications, etc. The provincial system includes public (primary) schools, a higher grade of which are called intermediate schools, and three collegiate institutes, at Winnipeg, Brandon, and Portage la Prairie. Schools are free and are supported

CANADA — CANADIAN UNIVERSITIES — CANADA — RACIAL POPULATION

by provincial grants, municipal grants, and a local school tax levied by the trustees. School districts are erected by local municipalities, and trustees are elected therein. The whole system closely resembles that of Ontario. For the provincial university see article CANADIAN UNIVERSITIES. The question of separate schools for Roman Catholics was long a subject of acute controversy. Established in 1871, they were abolished in 1890. The agitation in favor of their restoration reached an alarming crisis in 1895. A compromise was made in 1896 whereby religious instruction may be given during the last half hour of the school day, and which permits the Roman Catholic school children of a district, if numbering 25 or more, to have a teacher of their own denomination. British Columbia has a system of free, non-denominational public schools, controlled by the provincial government through a superintendent of education. The expenses of the schools are defrayed by the government, except in the towns of Victoria, Vancouver, Nanaimo, and New Westminster, which supplement the provincial school grant of \$10 per capita by local assessment. There are eight high schools, controlled by local boards of trustees, and a normal school, but no provincial universities. The Northwest Territories have a system of public schools administered by a commissioner of education who is a member of the executive council. The organization is similar to that of Ontario. There is a normal school at Regina, but as yet no high schools.

Canada — Racial Population. The last census of Canada stands for the date of 31 March 1901. In the enumeration count was made of the people by family, sex, conjugal condition, religion, origin or race, nationality, birth-place, citizenship, occupation or profession, education and language. The races of men were classed under the general heads of color and racial or tribal origin, without any attempt at classification by physical types, which is a work for experts. In the instructions given to enumerators, only four colors were recognized, viz., white for the Caucasian race, red for the American Indian, black for the Ethiopian or Negro, and yellow for the Mongolian. "Only pure whites will be classed as whites; the children begotten of marriages between whites and any one of the other races will be classed as red, black, or yellow, as the case may be, irrespective of the degree of color." In making the record of racial or tribal origin, enumerators were told that among whites such origin is traced through the father, but that care should be taken not to apply the terms "American" or "Canadian" in a tribal sense. In the case of Indians, the names of their tribes were required to be given; and persons of mixed white and red blood, usually called half-breeds, were to be described in addition to the tribal name with the

name of the white race infused in the blood. For example, "Cree, f. b." would denote that the person is racially a mixture of Cree and French; and "Chippewa, s. b." would denote that the person is Chippewa and Scotch. "A person whose father is English, but whose mother is Scotch, Irish, French, or any other race, will be ranked as English, and so with any others — the line of descent being traced through the father in the white races."

The census of 1891 omitted the enumeration of the people by races and origins, and to obtain a comparison with 1901 it is necessary to go back to 1881, in which year the population of the Dominion was 4,324,810. The following table gives the classification by color for 1881 and 1901:

Color	1881	1901
White	4,190,486	5,203,806
Red	108,547	127,932
Black	21,394	17,437
Yellow	4,383	22,050
Total	4,324,810	5,371,315

In 1881 the white race was 96.89 per cent of the whole population, the red 2.59, the black 0.51, and the yellow 0.01 per cent. In 1901 the white race was 96.88 per cent of the whole, the red 2.38, the black 0.33, and the yellow 0.41 per cent. The increase of the white population in the 20 years was 1,013,410, of the red 19,385, and of the yellow 17,667, while the black population showed a decrease of 3,957.

The population of the country by principal national or tribal races in 1881 and 1901, and the increase or decrease of each race during that period of 20 years, is shown in the next table:

Race	1881	1901	Increase
English	881,301	1,260,899	379,598
Irish	957,403	988,721	31,318
Scotch	699,863	800,154	100,291
Others of British origin	9,947	13,421	3,474
French	1,298,929	1,649,371	350,442
German	254,319	310,501	56,182
Dutch	30,412	33,845	3,433
Scandinavian	5,223	31,042	25,819
Russian	1,227	28,621	27,394
Italian	1,819	10,834	8,985
Jewish	667	16,131	15,464
Swiss	4,588	3,805	-783
Indian and half breed	108,517	127,932	19,385
Chinese and Japanese	4,383	22,050	17,667
Negro	21,394	17,437	-3,957
Various origins	3,952	24,952	21,000
Unspecified	40,806	31,539	-9,267
Total	4,324,810	5,371,315	1,046,505

* Decrease.

The number of people of the British races in 1881 was 2,548,514, and in 1901 it was 3,063,195, being an increase in the 20 years of 514,681, or 20.19 per cent. The French, who were the pioneers of Quebec and the Maritime Provinces (the old Acadia), numbered 1,298,929 in 1881, and 1,649,371 in 1901, being an increase of 350,442, or 27.75 per cent. In Quebec the French race has grown in the 20 years from 1,073,820 to 1,322,115, in New Brunswick from 56,635 to 79,979, in Nova Scotia from 41,219 to 45,161, in Prince Edward Island from 10,751 to 13,866, in Ontario from 102,743 to 158,671, in Manitoba from 9,949 to 16,021, in British Columbia from 916 to 4,600, and in the Northwest Territories from 2,806 to 7,040. (See CANADA — THE FRENCH CANADIANS.) During the same period the British races grew in Ontario from 1,548,030 to 1,732,144, in Quebec from 260,538 to 290,169, in Nova Scotia from 342,238 to 359,064, in Manitoba from 38,285 to 164,239, in British

CANADA — RACIAL POPULATION

Columbia from 14,660 to 106,403, and in the territories from 2,873 to 85,769. In New Brunswick the number of the British races fell from 245,974 to 237,524, and in Prince Edward Island from 95,916 to 87,883.

A noticeable feature of the five older provinces of Canada is the relative standing of the British races at the beginning and close of the 20 years' period. The English increased from 861,127 to 1,104,602, or 28.27 per cent, while the Scotch only increased from 678,248 to 693,043, or 2.09 per cent, and the Irish decreased from 943,777 to 899,260, or 4.95 per cent. The English increase is mostly in Ontario (165,578); in New Brunswick and Nova Scotia the increase was 42,063. The Scotch increased 26,139 in Ontario and Quebec, but decreased 11,344 in the Maritime Provinces, and the Irish decreased in all the provinces. In Manitoba, British Columbia, and the Northwest Territories the English race increased in the 20 years by 136,123, the Irish by 75,495, and the Scotch by 85,496. An obvious cause of these results in the older provinces is found in this record of population by birthplaces, which is shown for the principal British islands in the following table for the whole of Canada:

Born in	1881	1901
England	169,504	201,285
Ireland	185,526	101,629
Scotland	115,062	83,631
Total	470,092	386,545

There was an increase of 31,781 in the number born in England, but a decrease of 83,897 in the number born in Ireland and 31,431 in the number born in Scotland, and a net decrease of 83,547 in the number born in the three countries. Consequently there was a large falling off during the period of 20 years in the number of immigrants arrived in Canada from the British Islands as compared with years preceding 1881. The growth of the French race in Canada appears to be due almost wholly to natural increase, for the census tables show that in 1881 the number of persons in the country who were born in France was only 4,389, and in 1901 only 7,944. The other races of Continental Europe making up part of the population of Canada comprise German, Dutch, Scandinavian, Russian, Italian and Swiss. In 1881 these peoples together with Jews numbered 208,285, and in 1901 they were increased to 434,839. But to them are to be added for the latter year 18,178 Austro-Hungarians and 2,994 Belgians, which in the table of population by races are included under the head of "various origins." The remaining 3,780 under the same head embrace 1,637 Syrians, 861 Spaniards, 442 Portuguese, 201 Greeks, 225 Flemings, 73 Arabians, 57 Rumanians, 39 Turks, 34 Armenians, 16 Persians, and 9 Bulgarians, and nearly 100 of the minor races.

The Scandinavian race includes 10,594 enumerated as Swedes, 5,324 as Norwegians, 3,161 as Danes, 9,207 as Icelanders, and 2,666 as Scandinavians in general. The Icelandic race is found chiefly in Manitoba, where a colony was established a quarter of a century ago. But there are a few in Ontario and British Columbia and nearly a thousand in the territories, whence they have migrated from Manitoba.

The Russian race is made up largely of the religious body known as Doukhobors, who came to Canada to escape persecution in the closing years of the 19th century. They have settled as

colonies in Manitoba and the territories. Counted with the Russian race also are 5,726 Poles and 1,929 Finns.

The Austro-Hungarian races are composed largely of Galicians, Bohemians, and Slavonians who have settled in the Northwest.

A scientific classification of the European races in Canada's population would no doubt make many changes in the groups as given here, which are arranged generally in the national order. No other arrangement would be intelligible to most of the enumerators employed on the census, and it would happen but rarely that stature, or facial features, or form of the head, or texture of the hair, or spoken language would enable anyone concerned in the work to give or record a scientific answer. In an instance so apparently simple as the determination of race in the descendants of Highlanders who crossed the Grampians to the Lowlands of Scotland a century and a half ago the experts themselves are not infrequently perplexed even on Scottish ground. But much greater the problem becomes in a new world, where climate, environment and other conditions have reconstructed the physical man, in spite of the prepotency of racial characteristics.

The Indian races, including half-breeds, increased in the 20 years from 108,547 to 127,932, or 17.86 per cent. In 1901 there were 93,459 pure Indians and 34,473 half-breeds,—the latter term being officially used to describe a person of Indian and other blood in any degree of strain.

The census record of Indians for British Columbia is not very satisfactory, inasmuch as most of the bands have been described by enumerators by the name of the district they occupy instead of by their tribal names. In the other provinces and territories of the Dominion they have been properly described by tribal names, and the population of the principal ones is given in the following table:

Tribal Name	Population
Abnakis	385
Algonkin	2,360
Amalente	520
Assiniboin	258
Blackfoot	2,193
Chippeway or Ojibway	13,231
Cree	15,279
Dakota	231
Delaware	432
Dog Rib	607
Huron	228
Iroquois	8,608
Micmac	2,177
Montagnais	1,455
Ottawa	1,039
Peigan	513
Salteaux	600
Sarcee	173
Sioux	366
Slave	620
Stoney	435
Total	51,809

This table includes 22 Chippewas and 10 Crees in British Columbia, leaving for that province 25,456 Indians not described by their tribal names. The remaining 16,194 Indians consist of 3,302 in Yukon and 12,153 in the other far northern territories not described by tribal names, and 739 made up of small tribes or bands in the old provinces—among which are Mistassinis, Nipissings, Tête de Bull and Wapenakis in Quebec, Kioways in Nova Scotia, and Mississagas, Munsees, Shawnees, Wyandottes and one 'last of the Mohegans' in Ontario. The Abnakis are almost all in Quebec, and four-fifths of the Al-

CANADA—THE FRENCH CANADIAN

gonkins are in the same province. The Amalecites are in New Brunswick, but a few scattered ones are in Nova Scotia and Quebec. The Chippeways are in all the provinces except Nova Scotia and Prince Edward Island, but 10,126 are in Ontario, 1,035 in Manitoba, and 1,950 in the Northwest Territories. The Iroquois or Six Nations are in Ontario and Quebec,—5,660 in the former and 2,880 in the latter, with a few scattered ones elsewhere. The once powerful Hurons now exist as a small remnant at Ancienne Lorette, near the city of Quebec, but 15 out of the 228 are yet in Ontario. The ruins of their forts and the midden heaps of their camps in the rich farmland that lies between Lake Simcoe and Georgian Bay have been for the last 50 years interesting spots of research for the tireless antiquarian. The Crees are the most numerous of all the Indian tribes in Canada, but four fifths of them are in the Northwest Territories. Manitoba has 1,246, Ontario 585, and Quebec 628. The Montagnais are in Quebec, and the Ottawas and Delawares in Ontario. The last named, a branch of the old Lenapes, were brought to Canada by the Moravian missionaries late in the 18th century, and half a township of fine land was given to them by the government. The Blackfoots, Peigans, and Sarcées are in Alberta, and the Slaves and Dog Ribs in Mackenzie of the Northwest Territories.

The records of half-breeds show the Indians to be crossed with nearly all the races of the country, including Ethiopians and Mongolians, and there are some "breeds" in all the tribes. Following is the number under five classes:

Classes of Half-breeds	Population
English	4,447
French	17,886
Irish	1,132
Scotch	5,931
Other	5,055
Total	34,451

The French "breeds" are the most numerous, for the reason that for more than 300 years the French traders and trappers have been coming and going among the Indians, and occupying posts where business of the kind in which they were employed might be carried on in the easiest and best way. The *courreur de bois* or bush ranger sought trade in all the Indian country from Quebec to the Pacific Ocean, and wherever he went he became a member of a family or was adopted into a tribe. The Scotchman and the Englishman came in later as employees of the Hudson's Bay Company, and they, too, became tribesmen through adoption. As a rule the children did not take up the father's language, but they inherited his vices, and the Indian character was not improved by the new cross of blood. The "breed," however, acquired a few words of French, or English, or Gaelic, which helped him in trading, and so made him a useful means of communication between the white and the red races. But often in the far north it is noticeable by phrase and accent that his English has been learned from a Highlander or an Orkney man.

A few words may be said of the Eskimo race, whose habitat is portions of the mainland around Hudson Bay, in the Territories of Ungava and Keewatin, parts of Mackenzie and Yukon near the Arctic Ocean, and the islands in that ocean comprising Franklin. Their number is not accurately known, for a census of only

a part of them was taken at trading posts and mission stations when the yearly visit to these places was made. The chief occupations of the Eskimos are hunting and fishing, upon which their subsistence depends. They are a square-built folk, powerful and hardy; yet it is rare to find more than four or five in a family. Many of them can read well, and write in the syllabic form, although the census records of the East Main show that their whole time at school ranges only from 3 to 10 days. The same remark also applies to the Indians around Hudson Bay, most of whom can read and write and speak English. Like the Indian, the Eskimo finds his chief social pleasure in telling and hearing salacious stories, over which he will laugh uncontrollably. The mother tongue is Eskimo or Innuvit, and a few proper names of persons in a family will serve as examples:

Nápártók	male	head of family
Evidlak	female	wife
Apáluktak	male	son
Pookta	female	daughter
Kingnaroak	male	son
Kaukelak	female	boarder

The following table gives by provinces the number of the Chinese and Japanese races in 1881 and 1901, but separately only for the latter year:

PROVINCES	1881	1901	
	Chinese and Japanese	Chinese	Japanese
British Columbia	4,350	14,938	4,544
Manitoba	4	206	4
New Brunswick	59
Nova Scotia	106	1
Ontario	22	732	29
Prince Edward Island	4
Quebec	7	1,037	9
The Territories	286	95
Totals	4,383	17,368	4,682

The increase of the two races in the 20 years is 17.667 or 400 per cent, and has been almost wholly by immigration. A capitation tax of \$50 was imposed by the Canadian Parliament on Chinese immigrants in 1886, which on 1 Jan. 1901, was increased to \$100. But neither the first nor the second tax had any effect upon arrivals. On 1 Jan. 1904, the tax was further increased to \$500, and from that date to the end of the fiscal year, 30 June, only one Chinaman landed in the country. This tax does not apply to the Japanese, who continue to come in at a moderate rate. In 1901 they had adopted Canadian citizenship to the number of 1,070 or 22.85 per cent, and the Chinese to the number of 993 or only 5.72 per cent.

Canada has by its constitution two official languages, English and French, and its population five years of age and over is 4,728,631. Of this number 3,709,370 speak English, 1,514,977 speak French, 126,978 English speak English and French, and 529,552 French speak French and English. There are 1,019,261 who cannot speak English, 3,213,654 who cannot speak French, and 160,814 who cannot speak French or English. The third lot comprises many Indians and recent immigrants.

ARCHIBALD BLUE,
Census Commissioner, Ottawa.

Canada—The French Canadian. *Geographical Distribution.*—In 1901, according to the last Dominion census, 1,650,000 inhabitants of Canada, that is, a little more than one third of the whole population, were of French origin.

CANADA—THE FRENCH CANADIAN

Of these, by far the greater part, namely, over 1,300,000, were settled in the province of Quebec, forming 80 per cent of the total population of that province. But considerable numbers were located in some of the other provinces: nearly 150,000 in Ontario, 80,000 in New Brunswick, 45,000 in Nova Scotia, 14,000 in Prince Edward Island, while 16,000 were to be found in Manitoba, 7,000 in the Northwest Territories, 4,600 in British Columbia, and about 2,000 in the unorganized territories, principally the Yukon. Then, according to the last United States census, there were, in 1900, throughout the Union, nearly 400,000 Canadian-born French; and the total number of people of French Canadian extraction in the United States, if local statistics are to be credited, would exceed 1,000,000. From the point of view of physical and social geography, the French Canadian element in North America is made up as follows:

(1) The main body, 1,500,000 strong, extends uninterruptedly over Quebec, eastern and northern Ontario, and northern New Brunswick. The nucleus of this main body is a compact community of farmers occupying the banks of the Saint Lawrence and the valleys of its tributaries. On the outskirts of this central group, over the wooded and rocky highlands, north and south of the great river, but more especially throughout the plateaus of northern Quebec, northeastern Ontario, and northern New Brunswick, farming is largely supplemented by lumbering, and not infrequently by mining; while along the Gulf and sea-coast of Labrador, the Gaspé Peninsula, Chaleurs Bay, and eastern New Brunswick it is more or less superseded by fishing.

(2) Then, hardly separated from these, and from one another, we have, off the extreme eastern limit of this central group, the French-speaking communities of fishermen of Nova Scotia and Prince Edward Island; while, as a projection from the opposite extreme western border, in Ontario, we find, along the shores of the Saint Lawrence and the Great Lakes, a string of small settlements of French Canadian rivermen, boatmen, and woodsmen, forming an almost continuous chain around that province and connecting, as it were, the two large French groups of Detroit River and Georgian Bay with the still larger one occupying the western bank of the Ottawa. Over one third, namely, about 500,000, of the total French element composing this main body and its projections are congregated in villages, towns, or cities, where they make a living through physical labor, trading, the crafts, and the liberal professions.

(3) As distinct outlyers from the above main group, we have, in the first place, the many French-speaking communities of urban population, which, in very large, though fluctuating numbers, are spread throughout the manufacturing towns of the North Atlantic States of the Union, principally Massachusetts; in the second place, smaller and sparser groups of French-speaking farmers (at times woodsmen and miners as well), to be found in the Western country, in Manitoba, Alberta, and in some States of the North Central division of the Union, especially Michigan, Wisconsin, Minnesota, and Illinois; in the third place, still smaller and sparser groups of French Canadian prospectors or miners, spread in the camps and towns of British Columbia, the Yukon, and

some of the States of the Western division of the Union, principally Montana and California. Lastly, French Canadian families or individuals are to be found in every part of the Union, though in the States of the South Atlantic, South Central, and Western divisions they aggregate in most cases a few units or a few hundred only. About 40 per cent of the total French Canadian element in the United States are located in 160 principal cities.

Social Features.—The most widespread, fundamental, and characteristic type of the French Canadian is the habitant, or farmer, of the province of Quebec (q.v.). From a study of his conditions there may be gathered the clearest idea of the capabilities and limitations of the race as a whole. Three main groupings are distinctive of social life in the French Canadian country: the habitant's household, the range, the parish.

(1) The habitant's household normally consists of two families, that of the senior householder, and that of an associate son and heir; it includes generally sisters and younger brothers of the heir, children of the younger couple, and, in some cases, sisters of the senior father of family. We have thus a group of some 10 or more persons, closely bound together, not only by ties of kinship and family love, but by co-operative effort, community of interest and habits of mutual dependence, which extend, in a measure, even to those members of the group who have settled outside of the family circle. The habitant's household is primarily a labor organism, a workshop. Agriculture is its mainstay; but it is of a type neither extensive nor intensive, its scope being narrowed down to the task of satisfying directly the household's needs, and limited by the household's internal supply of labor. The farms seldom exceed 100 acres in area, and outside hired help is resorted to in very exceptional cases only. To avoid this contingency, women and children are called upon to work in the fields, especially in haying and harvesting time. On the other hand, the object being to provide directly, as far as circumstances will permit, for all the requirements of the family, habitant farming is greatly diversified. On almost every farm there are to be found, beside the kitchen-garden and its few fruit trees, small patches of flax, tobacco, potatoes, Indian corn, buckwheat, and barley, while larger areas are given to other cereals, hay, and pasture. Similarly, all kinds of stock are kept on each farm, though seldom any in large numbers or of excellent quality. Various home industries, such as the spinning and weaving of both flax and wool, the manufacture of maple syrup and sugar, carpentry, joinery, cooperage, brush-making, leather-working, etc., are an important factor on many farms. Agriculture is seldom the sole means of living of the habitant, since in the newer settlements the mere gathering of natural products, such as fish, game, wild fruits, and wood is largely resorted to, while in the older and more densely populated sections by-industries are conspicuous. Then again temporary emigration to and employment in the manufacturing, mining, and lumbering centres of Canada and the United States is, in all situations, an occasional means of securing capital to start out in life or of bridging over hard times. The methods of farming of the habitant, his rotation of crops, his processes of retting

CANADA — THE FRENCH CANADIAN

and breaking flax, dyeing wool, making candles, etc., are traditional and have been in use for centuries in certain provinces of France. However, in recent years, the wave of modern progress has been felt, agricultural machinery has come into fairly general use, co-operative butter and cheese factories have been established, and, especially in the vicinity of railways, improved methods and a more specialized type of farming have been adopted. Through hard work and close economy a capable habitant will succeed, with the help of his family, in building up a homestead of sufficient area to meet the wants of the household. Should his acquisitions of land during his lifetime remain within that limit, then the homestead will be transferred in its entirety to the associate son or heir, who in turn will be charged with providing for the whole family, in the same way as the testator would have done. On the other hand, should the acquisitions of the father of family exceed the area required for the support of an ordinary household, the lots in excess are freely used in helping out other sons who, after contributing to the sustenance and welfare of the paternal household in their early life, undertake to make an independent living through agriculture. Girls receive very little aid from the family estate, as it is considered they will be provided for either through remaining as members of the paternal household, or through marrying into some neighboring family. Likewise, sons who are sent to college and enter the liberal professions or the priesthood, receive very little else from their parents. In the management of the family affairs, the influence of the mother is about on a par with that of the father. As a rule she is better educated than her husband, sees to the correspondence and accounts, is consulted in all matters of importance, and leads in the family worship. Through working with their parents on the farm the children acquire a variety of aptitudes, but no particular proficiency in any of the arts, nor any strong desire of attaining eminence in the various walks of life, barring possibly priesthood and politics. Education is reserved for the few who take to the liberal professions and the Church. The style of living is plain, and in many respects old-fashioned. Food is in abundance, though lacking in delicacy. The house, usually of wood and whitewashed, is often rather small for the accommodation of its inmates, but as a rule kept clean and tidy. Homespun, still in use in a few families in isolated sections, is fast being replaced by the cheap cotton and woollen goods supplied by the trade. Births are numerous, but owing to defective hygienic conditions, or to overwork on the part of mothers, this advantage is partially offset by the high proportion of deaths among infants. Amusements are simple, pertaining to the daily work, the family circle, church festivals. Many of the songs and dances are importations or adaptations from Old France. However, here, as throughout the whole range of social phenomena, outside influences are apparent, and features of recent origin are found grafted on old and quaint usages.

(2) The farms are in the shape of long, narrow rectangles, 20 or 30 arpents in length, by 2 or 3 in breadth. The farm buildings are all built at one end of these rectangles, along the public road, which crosses them at right angles, thus giving a close succession of houses and

barns. Not infrequently the buildings of two abutting ranges are situated on opposite sides of the same road, making a double row of almost contiguous houses, somewhat like a village street. The ranges, of which there are four or five in parallel line in every parish, connect with one another and with the village by means of "routes" or transverse roads, along which no buildings are erected; so that each range is isolated from the rest and forms a distinct grouping within the parish. This type of settlement, which differs from that of the isolated homestead to be found in some parts of France and throughout the Anglo-Saxon world, and also from the central village type observed in other parts of France and Europe, is a distinctly French Canadian creation, which the habitant takes with him wherever he settles in numbers. The range seems to have been the outcome of the desire on the part of the habitant, while residing on his own farm (which the village settlement would not allow him to do), to secure the benefit of his neighbor's assistance and company in a more effective way than the isolated homestead would permit. What the habitant cannot accomplish with the help of his family he endeavors to do through the free help of his neighbors. However, while the nearest neighbor, on either side, may be called upon now and then to lend a hand in the ordinary work of the farm, the summoning in numbers of the near-by farmers is resorted to in exceptional cases only, such as the clearing of land, the "lifting" of a barn, or the relief of some destitute family. Each range looks after its poor, by means of voluntary contributions, principally in kind. Each range has its cheese or butter factory, its school house, also its large wooden cross along the highway, in commemoration of some religious revival.

(3) The roads leading from the various ranges all centre toward a village, generally small, comprising a few lodgings, workshops, and stores, besides the priest's house and the church. A community wherein the highest aim of the farmer, the basal element, is to cater to all the needs of his household directly through the labor of his own family and the occasional assistance of his neighbors, does not leave much scope for the development of other social factors. The ambitions and efforts of the most capable being restrained within that limit, equality and similarity of condition is the rule. Commerce, industry, the liberal professions remain embryonic. In the absence of leaders in agriculture, industry, and commerce, learning becomes the standard of distinction. A few wise old farmers, the doctor, the notary, the lawyer, are looked up to; but, on account of the exalted nature of his function, the parish priest is decidedly the dominant factor. Like the family and the range, the parish is primarily an organism for mutual support, both in the physical and moral order. It plays to a certain extent the part of an insurance company, as barns, for instance, destroyed by fire are restored through contributions from all the parishioners in material or labor. On Sundays and feast days the habitant meets at church his co-parishioners, who are all relatives or close acquaintances, the doctor, the notary; he listens to the admonitions of the "curé," to the announcements made by the public crier, and receives the intelligence and impressions which will be his mental

CANADA — THE FRENCH CANADIAN

food for the remainder of the week. To all intents, the parish may be considered as an enlargement of the family, with the parish priest as its patriarchal head. Then, the parish is the main organ of local government in the French Canadian country, the school commission and the municipal corporation, of British origin and of comparatively recent introduction, remaining mere adjuncts, only partially developed, of the parish proper. The revenues of the latter often exceed those of the school commission and municipal body put together. Many localities have no town-hall other than the vestry. In practice the curé is much more the maintainer of the peace and the arbitrator of disputes within the parish than are the mayor, the local magistrates, and court. His powers extend even to a close supervision of family affairs. The law of the province allows him the 26th bushel of all cereals grown by his parishioners within his territory, and his influence over the church wardens and flock generally enables him to obtain from close-fisted farmers the expenditure of comparatively large sums of money on church buildings. His influence is exerted as well over the school commission and municipal council, whose policy and decisions are usually made to conform to his wishes. On the other hand, practically the only check on the curé is the far-off bishop, who visits the parish and inspects the books every third year, and may remove him at will. The school commission and municipal corporation are administered in a spirit of parsimony. School buildings are inadequate, and the teachers, generally girls, receive very little pay and give correspondingly poor results. Illiterates are still in large numbers. As each individual farmer is required to look directly after that part of the public highway which faces his property, and to contribute his share of the labor necessary for the maintenance of the cross-road leading to the village, the municipal council has little to do apart from supervising, in a general way, the repairing of roads or the occasional building or repairing of bridges within the limits of the parish. Similarly, county councils have not acquired in the French country anything like the importance which they have in English sections, and are content with looking after roads, bridges, or water courses common to two or more parishes. On the other hand, Provincial and Federal politics have taken quite a hold on the habitant; but the interest which he takes in them is more the outcome of his inclination for clannish warfare and oratory, and of his craving for the petty favors of officialism, than the result of a desire on his part to insure the proper management of public affairs, which he does not always grasp. These are the prey of organized political parties, whose leaders are recruited mainly from the liberal professions and the cities. Church and politics are, in the mind of the habitant, the only avenues open to those desirous of rising in the world. And this accounts for a rather remarkable development of institutions of classical and literary teaching in a community wherein common schools are markedly deficient and technical and business training neglected.

Evolution.—On the basis of the classification of societies proposed by F. LePlay and his followers, H. de Tourville and the French school of social science, the French Canadian is

a semi-patriarchal or semi-communistic type; that is one in which social organization and life, while swayed by tradition and habits of mutual dependence to a less degree than in the purely patriarchal or communistic types of the Orient, still are not permeated and uplifted by that spirit of private independence and enterprise distinctive of the individualistic or "particularistic" types, as exemplified in the Anglo-Saxon races. His semi-communistic training the French Canadian holds from France. His social ancestors were mainly the Gaul, on the one hand, the Frank on the other. The former, with his clan organization, village life, and neglect of agriculture, was a distinctly communistic type. The particularistic Frank broke up, to some extent, the clannish and communistic spirit and institutions of the Gaul, and gave a strong impulse to agricultural pursuits; but his influence, for reasons which it would be too long to set forth here, was not so lasting nor so far-reaching in France as was that of his duplicate, the Saxon, in England. Thus there sprung up an intermediate type presenting many of the qualities and defects of the Celt, with something of the qualities of the Saxon. A farmer, an artisan, a trader, though generally in a small way and still conserving a fondness for nature and primitive, easy-going occupations; a race lacking ambition and ability to rise in the ordinary callings of life, having for its sole leaders the clergy and the military or civil officers of the Crown; and these leaders, though in many cases sprung from the people, isolated from them by class interests and training and unfit to lead adequately in practical pursuits. Under the trying conditions of New France—the dense forest to clear, the rigorous climate to provide against, the lurking Iroquois to evade—the peasant from north central France, single-handed, made rather slow progress at colonization. Agriculture was neglected, while the more attractive, more remunerative, though deceptive, fur trade became the means of sustenance of both the individual and the colonial government, with a consequent rapid but superficial expansion of the colony and constant warring. The French settler, fond of home and of quiet, evolved into the adventurous and hardy type of the *coureur des bois*. Under British rule, and especially in the course of the 19th century, through the restoration of peace and the advent from Great Britain of a class of business men, the fur trade, carried on by large companies, receded toward Hudson Bay and the Far West, vast lumbering operations were carried on, with a consequent impulse to agriculture, extension of settlements, increase in population; a period of unprecedented prosperity for French Canada. Then, in the latter half of the 19th century, the world-wide evolution of commerce and industry set in, with its marvelous applications of steam and electricity, its powerful machinery and means of transportation, the progress of manufacturing centres; and the French Canadians developed a class of factory operatives, together with a vigorous undergrowth of artisans and traders in the large cities. CANADA—RELIGIOUS CONDITIONS

Canada—Religious Conditions. The religious and ecclesiastical life of Canada cannot be understood without some reference to the sources from which it sprang. The same great forces and influences which molded the history of the Old World re-appear here, but modified in their action and combinations by the new and freer environment in which they work.

General History.—The Roman Catholic Church is the oldest and largest of the ecclesiastical bodies in Canada. It has its chief seat in the province of Quebec. In Canada, under French rule, it was all-powerful. In its origin it was distinctively missionary. The Jesuits were the pioneers and, from the Saint Lawrence to the Rockies, have left an imperishable record. Mgr. Laval (see LAVAL-MONTMORENCY, FRANÇOIS XAVIER DE) in 1674 obtained the erection of the diocese of Quebec and laid the foundations of a regular system of ecclesiastical government. Parishes were established and provision made for the support of the clergy and for the performance of divine worship. The system of tithes was inaugurated in 1663. The Church grew in wealth. Of all the lands, exclusive of islands, granted by the French government previous to the cession to England, at least one fourth came into the possession of the Church. The Jesuits acquired extensive estates, which subsequently became the subject of litigation and political agitation. By the Treaty of Paris (1763) (see PARIS, TREATIES OF) the French Canadians were allowed full liberty "to profess the worship of their religion according to the rites of the Romish Church, as far as the laws of Great Britain permit." This was confirmed by the Quebec Act of 1774, by which also the tithes and rights of the Roman Catholic clergy were secured. The Church in Canada, under the French dominion, was modeled after the National Church of France. The ecclesiastical laws of France were extended to Canada, and with them the so-called Gallican liberties (see GALLICANISM). After the conquest these continued for some time to be more or less observed, along with the assertion of the rights of the sovereign, from which, in France, they had never been separated. It was evidently the intention of the British government to maintain in Canada the previously existing relations between Church and State as defined in Gallicanism, subject only to such changes as the laws of England might necessitate. After many futile attempts to secure some form of concordat with the Papal authorities, it became evident that this Anglo-Gallican policy was impracticable. The more stringent regulations fell into abeyance. In 1806 the Pope appointed M. Plessis (see PLESSIS, JOSEPH OCTAVE) to the See of Quebec, which had been vacant for some time on account of difficulties with the government. From this time the Roman Catholic Church, while richly endowed by the state and practically established by law, was independent in its internal government and as free from state control as other Churches. Besides the political causes which contributed to the failure of the British attempt to perpetuate the Gallican policy, account must be taken of the change within the Church itself by which Gallicanism was rapidly supplanted by Ultramontanism, just as it was in France. The French ecclesiastical law was superseded by the Roman canon law, the Gallican liturgy gave place to the Roman

liturgy, and the attitude of the clergy generally toward the civil power changed greatly. This development was accelerated by the publication of the decrees of the Vatican Council (q.v.) in 1870. In Canada, as in France, Gallicanism is a mere matter of past history. But during the last decade not a few significant indications have appeared of a reaction towards a more tolerant and liberal spirit especially among the laity. In the other Provinces the Roman Catholic Church holds a strong position. In the Maritime Provinces there is a large French population, especially along the shores of the Gulf of Saint Lawrence and the Straits of Northumberland. In Cape Breton and the contiguous districts of Nova Scotia many Roman Catholics from the highlands of Scotland settled. Irish Roman Catholics are numerous, especially in the cities of Halifax and Saint John. In all, there are not less than 300,000 members of the Roman Catholic Church in the Provinces by the Sea. The French Canadians have flowed over the boundary from Quebec into Ontario; and they have emigrated extensively into Manitoba and the Northwest Territories. In all these districts are also found both Irish and Scotch Roman Catholics. In Ontario there are, in all, nearly 400,000 Roman Catholics out of a population of upward of 2,250,000. In Manitoba and the West there are about 110,000. The total Roman Catholic population of the Dominion is about 2,230,000.

The Church of England in Canada may be traced back to the few and scattered settlers who followed the British regiments into Nova Scotia and Quebec in the latter part of the 18th century. It received its first accession of strength in the Loyalist refugees who flocked into Canada in 1783-4, many of whom were attached members of the Episcopal Church. The organized life of the Church began with the consecration of the first bishop of Nova Scotia, Dr. Charles Inglis (q.v.), 12 Aug. 1787. In 1798 Dr. Jacob Mountain was consecrated bishop of Quebec. The diocese of Montreal was set apart in 1850. In 1838 Dr. John Strachan was consecrated bishop of Toronto, with the whole of Upper Canada as his diocese. So far the Church had been chiefly dependent for its support upon the English societies, especially the Society for the Propagation of the Gospel. An important step toward self-support was taken in 1842 by the inauguration of the Church Society of the Diocese of Toronto, for the purpose of collecting and disbursing funds for the support and extension of the Church's work. The year 1851 was signalized by a notable advance in the development of the Church. Hitherto the bishops had been appointed by the Crown and the chief ecclesiastical superintendence was in the hands of the archbishop of Canterbury. Now the Church was given self-government in each diocese, by a synod consisting of the clergy and duly elected representatives of the laity, with the right to elect its own bishops. As the Church grew, the diocese of Toronto was gradually subdivided, until now it comprises within its former limits the five dioceses of Toronto, Huron, Ontario, Ottawa, and Niagara, and also the missionary diocese of Algoma and the greater part of the dioceses of Keewatin and Moosonee. In 1845 the diocese of Nova Scotia was subdivided, and that part of it which now forms the province of New Bruns-

CANADA — RELIGIOUS CONDITIONS

wick was erected into the new diocese of Fredericton.

For many years each diocese was independent; there was no organic connection binding them together, beyond their common relations to the Church in England. In 1861 the Provincial Synod was constituted, and comprised within its jurisdiction all the then existing dioceses of Eastern Canada. But there had grown up in the Far West another distinct organization. In 1820 the Hudson's Bay Company (see CANADA — THE HUDSON'S BAY COMPANY) sent out to Fort Garry the first missionary, who ministered assiduously to the servants of the company and the few settlers, both Church of England and Presbyterian, and made some feeble efforts to evangelize the heathen Indians. Others followed. The work was so far advanced in 1849 that the diocese of Rupert's Land was created. It was, for many years, chiefly a missionary work, sustained by the Church Missionary Society, but the federation of all the Provinces into the Dominion of Canada and the opening up of the vast territories hitherto traversed only by the Indian and the trapper led to the rapid influx of population and gave a strong impetus to the work of the Church. The dioceses of Saskatchewan, Calgary, and Qu'Appelle were created. There were also set apart the missionary dioceses of Mackenzie River and Athabasca, and on the Pacific coast the dioceses of New Westminster, Kootenay, Caledonia, and Selkirk. In 1890 an important conference was held in Winnipeg, the object of which was to adopt a scheme for the unification of the Church throughout Canada. This scheme, with little change, became the basis of the constitution of the General Synod, which first met in Toronto in 1893. The Church of England in Canada, from the Atlantic to the Pacific, was now one organized body, possessed of all the powers of self-government.

The Presbyterian Church of Canada traces its descent to several distinct sources. The attempt made in the 17th century to found Huguenot settlements failed disastrously and few traces remain of their existence. Among the Presbyterian Loyalists who came to Canada at the close of the Revolutionary War there was a goodly number of descendants of Huguenots. In 1740 Protestant colonists were brought into Nova Scotia from England and the Continent, in order to counteract the disaffection of the Acadians. Again in 1755, after the expulsion of the Acadians, many Protestants from Great Britain and older colonies along the Atlantic coast were induced, by the promise of liberty of conscience and of worship, to occupy the vacant lands. Then there was a large influx of immigration from the north of Ireland and from Scotland. Some districts, such as the county of Pictou, were almost exclusively occupied by Scotch Presbyterians. These people naturally clung to the various ecclesiastical bodies into which Scotch Presbyterianism was divided. And accordingly there were Presbyteries constituted with relations to the Kirk of Scotland and the Secession Church in its two subdivisions of Burgher and Anti-Burgher, and also adherents of the Reformed Presbyterians, or Covenanters. The great disruption of the Church of Scotland in 1843 extended to the colonies and added to the existing divisions the Free Presbyterian Church. But in 1861 the process of reunion

began with the union of the United Secession Church (inclusive of both Burgher and Anti-Burgher) and the Free Church of the Maritime Provinces into one synod.

The history of the Presbyterian Church in the Western provinces followed similar lines but with new complications. Soon after the conquest, Presbyterian congregations were organized in the cities of Quebec and Montreal. Among the Loyalists were not a few Presbyterians. But there was scanty provision for their religious needs. Applications for ministers made to the churches in Scotland met with no response for many years. A similar appeal made to the "Associated Reformed Church" in the United States resulted in the incoming of a number of ministers from that country. Other ministers followed from Scotland and Ireland. In 1818 was organized "The Presbytery of the Canadas." In 1831 there was organized a synod in connection with the Church of Scotland. In 1840 the two synods were united into one. But in 1843 the great disruption in Scotland again rent it asunder and two synods resulted, one in connection with the Established Church of Scotland and the other in connection with the Free Church of Scotland. Besides these there were other independent Presbyteries, one at Niagara and the other at Stamford, composed of ministers from the United States, and a third originated by ministers from Scotland and from Nova Scotia, connected with the "United Presbyterian Church." The first two were disbanded and absorbed into the larger bodies. The third, in 1861, united with the Free Church and the combined body received the name of the Canada Presbyterian Church. In 1875 the greater union was consummated by which all the Presbyterian bodies throughout Canada from east to west, were united in one great Canadian Presbyterian Church.

Until the greater union was consummated little had been attempted by the Presbyterians in the evangelization of the Northwest. In 1812 and 1816 a large body of Highlanders had settled in the Red River district, but the only ministers they had were those of the Church of England until 1852, when the Rev. John Black, a devoted missionary, organized them into a congregation. Little more was done until after the federation of Canada and the complete union of the Canadian Presbyterians. In 1881 the General Assembly appointed the Rev. Dr. James Robertson to be superintendent of Presbyterian missions in the Northwest. This remarkable man laid the foundations of Presbyterian organization throughout those vast territories and covered the whole country with a network of Presbyterian missions.

The Methodist Church in Canada traces its origin to two distinct sources, England and the United States. In 1770 Lieutenant-Governor Franklin sought English settlers for the province of Nova Scotia in the East Riding of Yorkshire. Among them were the earliest Methodists of Canada, one of whom was the noted preacher and evangelist, John Black. In 1784 he went to the United States, and his appeal to the Baltimore conference led to the coming of a number of Methodist ministers to the Maritime Provinces. In Quebec the first Methodist preachers were connected with the British regiments. As early as 1778 Methodists

CANADA — RELIGIOUS CONDITIONS

from New York State came to the Eastern Townships and to Upper Canada. The Methodists did a noble work in laying the foundation of religious life and worship in many districts in Canada, especially in the province of Ontario. Until the War of 1812 Canadian Methodism was closely connected with that of the United States. Negotiations were then entered into with the British Wesleyans. Unhappy dissensions followed. While one party was anxious to maintain the American connection, the other insisted that, as loyal British subjects, they should look to the mother land. A compromise was arrived at by which the American connection was to be observed in Upper Canada, while the British missionaries were to be free to enter Lower Canada. This compromise was of short duration; for when, in 1828, the American conference relinquished its jurisdiction over the Canadian conference and the latter was independently organized under the name of the Methodist Episcopal Church in Canada, the British conference decided not to confine its work to Lower Canada. After much controversy, in 1833 a union between these two branches of Methodism was consummated under the name of "The Wesleyan Methodist Church in North America." But, notwithstanding this union, the Methodist Episcopal Church survived in a new form and increased very rapidly.

Methodist missionary work in the Northwest began about 1840. Its annals abound with noble achievements. There now existed in Canada five principal Methodist bodies. In addition to the two main bodies already mentioned, different branches of British Methodism had been brought into the country, namely, the Methodist New Connection, the Primitive Methodist body, and the Bible Christians. All these became firmly rooted in Canada and developed into strong bodies. The need of unification began to be earnestly discussed as early as 1866; but it was not until 1883 that, at a general conference held in Belleville, the union was consummated. Then all the Methodist bodies, hitherto locally or ecclesiastically separated, were brought together; and, from the Atlantic to the Pacific, there is now one great Methodist Church of Canada.

The Baptist Church derived its origin from the American Baptists. From 1760 onward there are traces of individual Baptists in different localities in Nova Scotia. In 1820 the first Baptist association was formed for the Maritime Provinces. The first Baptist Church in Lower Canada was formed in 1794, and consisted chiefly of Loyalist refugees from Connecticut. In 1795 another was organized in Upper Canada. The first Baptist Church in Montreal was not organized until 1830. The Baptists in Canada are chiefly close communion. There is a body of "Free Baptists" which maintains open communion as in Britain, and welcomes all Christians, by whatsoever mode baptized, to the Lord's table.

Congregationalism has never found a strong footing in Canada. A few scattered adherents came from New England to Nova Scotia in 1758. In the eastern townships Congregationalism was founded in 1811 by settlers from Massachusetts, and in Ontario some 10 or 12 years later. Nothing was done west of Ontario until 1870, when work was begun in Winnipeg.

The Lutheran Church in Canada dates from

the middle of the 18th century. The first German Lutheran landed at Lunenburg, Nova Scotia, in 1749. The first Lutheran congregation in Upper Canada was founded in 1775. Others came in with German immigration. In 1853 the Canada Conference of the Lutheran Church was founded.

There are a number of small religious bodies in Canada, none of which exercises any appreciable influence upon the religious life of the country; chief among them are The Disciples and The Brethren. There are a few Unitarians and Quakers. The Salvation Army has acquired a considerable foothold in the larger cities and towns.

There are four paramount considerations which have profoundly affected the whole religious history and development of the country, namely, the relations of the Churches to the state and to education, their beneficent and missionary activities, and the problem of church union.

Church and State.—In the 18th century neither the principles of responsible government nor the special conditions of Canada were rightly understood by its rulers. It was believed that an Established Church was necessary in order to secure the loyalty of the colonists, and it was, without doubt, the intention of the British government to maintain an Anglican establishment in Upper Canada the counterpart of the Roman Catholic establishment in Lower Canada. In 1792 Lieutenant-Governor Simcoe urged upon the home government the necessity of establishing the Church of England in Upper Canada, as the only means of fostering the spirit of loyalty in that Province. There was nothing in the conditions of the country to warrant the monopoly of religious functions and privileges by any denomination, but the Anglicans had the prestige of their relations to the Established Church in England. The Constitutional Act of 1791 reaffirmed the provision of previous legislation, giving the king the right to set apart for the support of the "Protestant clergy" the seventh part of all ungranted Crown lands. This was the origin of the "clergy reserves" (see CANADA — THE CLERGY RESERVES). The ambiguity of the term "Protestant clergy" admitted of a variety of interpretations. The Anglican clergy maintained that they alone were intended by the designation. The few clergy connected with the Established Presbyterian Church of Scotland contended that they had an equal right to it, and their claim was supported by eminent legal authority in England. The Methodists, in general, resisted such an appropriation of the public lands, but the British Wesleyans urged an acceptance of a portion of the "clergy reserves." This, for a time, created a division among them. Their resistance and the disruption of the Presbyterians hindered the carrying-out of the scheme. In 1836 the lieutenant-governor, Sir John Colborne, erected and endowed 44 rectories in Upper Canada. Futile endeavors were made to secure the lands for educational purposes. Acts to that effect were repeatedly passed by the House of Assembly and rejected by the Legislative Council. At last, in 1854, in the face of the protests of Bishop Strachan and other Anglican leaders, the act was passed by the legislature of Upper Canada, by which the lands were handed over to the municipal

CANADA — RELIGIOUS CONDITIONS

corporations of the province for secular purposes, provision being made to satisfy the claims of existing incumbents. In lieu of these claims there was paid over to the Church of England the sum of \$1,103,405; to the Church of Scotland, \$509,739; to other Presbyterians, \$8,962; to the Wesleyan Methodists, \$39,074; and to the Roman Catholics in Upper Canada, \$83,731. The Anglican Church was thus delivered from what threatened to be its ruin, and the people of the Province released from a grievous injustice and a source of political discontent and strife.

The representatives of the Churches of England and Scotland, especially the former, had a certain status accorded to them, denied to other denominations. The Methodists were most unjustly charged with disloyalty, to which their connection, in origin and government, with the United States gave some color of plausibility. Until 1830 the Methodists and other dissenters had no right to hold land for places of worship or for the burial of their dead, nor had the Methodists and their ministers the right to solemnize matrimony, even among their own people. It was only after long and bitter controversy that laws were passed authorizing the various religious bodies to hold land for churches, parsonages, and burial grounds, and empowering their ministers to celebrate marriages. The struggle in the other provinces was less acute, but of a similar character. The Northwest was singularly free from these difficulties. The outcome of this controversy throughout Canada was the complete separation of Church and State, with the exception of the peculiar position held by the Roman Catholic Church in Quebec, secured by treaty and the terms of British occupancy of that province.

The Church and Education.—So long as France held Canada, education was entirely in the hands of the Roman Catholic Church. The Jesuits, Franciscans, and other orders laid the foundations of the colleges and seminaries which hold an important place in the education of Lower Canada. Thus the system of education was entirely ecclesiastical. Under British rule the attempt was made to establish free schools common to the whole population and unsectarian in character. This was found to be impracticable. With the union of the two provinces in 1841 separate schools had to be conceded to the Protestants in Lower Canada because the public school system was essentially Roman Catholic; and when, in the same year, the first attempt at a general system of public schools was made in Upper Canada, the Roman Catholics there secured the concession of separate schools, but in a very limited way. This, for many years, was a subject of controversy, political as well as religious, the Liberal party demanding the abolition of separate schools and the Roman Catholic authorities seeking the complete control of the education of their children. Finally, on confederation in 1867, the separate school system was bound upon the province of Ontario; although, as is noteworthy, there are more Roman Catholic children in the public schools of Ontario than in the separate schools. In the Maritime Provinces and in northwestern Canada there are no separate schools.

While public school education has been removed from the control of the churches (except in Quebec) the great body of the people

are anxious that it should not be divorced from the sanctions and influences of religion. In the Province of Ontario, the public schools are, with few exceptions, opened daily with prayer and the reading of the Scriptures. In not a few, the Bible is carefully taught. But much depends not only upon the character of the teachers, but also upon the disposition of the school trustees, to whom the law gives a large discretion in this matter. There is a strong feeling growing in the community at large and expressed by resolutions of the different church legislatures that there is urgent need of more ethical and Biblical teaching in the schools and that it is possible to secure it upon lines acceptable to the great majority of the people and with proper regard for the conscientious convictions of those who may differ from them.

Sectarian jealousies greatly hindered the development of higher education in all the older provinces. The struggle in Ontario occupied a very large place, both in the politics and the religious life of the province. The attempt to create a national university was for a long time prevented by the exclusive policy of the Anglican authorities, who used public funds for the establishment of King's College in 1843 (the charter was obtained in 1827) upon an exclusively Anglican basis. In 1849 King's College was secularized and became the University of Toronto, upon a broad undenominational basis, but not until the Church of Scotland, shut out from King's College, had established Queen's University, and the Methodists founded Victoria University, afterward federated with the University of Toronto. Other denominational colleges sprang into existence. After the secularization of King's College, Trinity University was established by Bishop Strachan, upon an exclusively Anglican basis. The leaders of the broader policy had been broad-minded Anglican laymen, and it was laymen of the same type who, in 1877, established Wycliffe College, federated with the University of Toronto and upon a distinctively evangelical or "Low Church" basis, as opposed to the High Church position of Trinity University. The latter has not realized the expectations of its founders, and now, in 1904, has abandoned its position of isolation and connected itself with the University of Toronto as a federated college. The result is that, in Ontario to-day, there are Church of England, Presbyterian, Methodist, and Roman Catholic colleges federated with the Provincial University; while, apart from it, there still stand the Presbyterian University of Queen's, the Baptist University of McMaster, and several Roman Catholic institutions. In Montreal, McGill is virtually a Protestant university, and has affiliated with it Presbyterian, Methodist, Congregational, and Anglican schools of theology. In Quebec, Laval University is a Roman Catholic institution and the oldest in Canada. In each of the provinces of Nova Scotia and New Brunswick a university was founded under the name of King's College and sustained by means of land and money from the public treasury, but upon an exclusively Anglican basis. The one in Fredericton was remodeled and became the University of New Brunswick, upon a broad, undenominational basis; the other, in Windsor, Nova Scotia, ceased to receive provincial support but remained an Anglican university and theological college. Dalhousie University, in Halifax, while unde-

CANADA—RELIGIOUS CONDITIONS

nominal, has not the status of a provincial university. The Presbyterians have a theological college in connection with Dalhousie. The Baptists have a university in Acadia, Nova Scotia; and the Methodists a university and theological college in Sackville, New Brunswick.

The Work of the Churches.—The Roman Catholic Church carries on a great variety of charitable work in asylums, houses of refuge, and reformatories. In the Province of Quebec all the provincial institutions are under Roman Catholic control. In the cities the Protestants have distinct institutions controlled by boards representative of the chief Protestant churches. In Ontario, the Roman Catholics are upon the same footing with Protestants in the provincial institutions. In many cities and towns the former have their own hospitals and reformatories, which receive provincial aid in proportion to the number of patients treated. This plan also prevails in the other provinces to a less extent. In other cases, special provision is made for Roman Catholic religious services in addition to the Protestant services.

The charitable work of the Roman Catholic Church is carried on by the various religious orders, many of which are specially devoted to the relief of the poor, the sick, and the fallen.

The work of home missions within the Dominion in connection with the different churches reaches out to every corner of the land, and to the Indians and Eskimos. Foreign missionary work is prosecuted with great vigor by all denominations. Among other good works of an undenominational character may be mentioned the Bible Society, the Religious Tract Society, the Evangelical Alliance, the Young Men's Christian Association, the great Christian movement organized by Mr. Mott among university students, the Young People's societies, such as the Christian Endeavor, the Epworth League, and the Saint Andrew's Brotherhood. The organization of women in the home and foreign missionary work of all the churches and in various other associations has greatly stimulated religious life and work. The reverent observance of the Lord's Day throughout Canada has been a marked feature in its religious life. Church attendance has, on the whole, been well maintained. The laws against Sunday excursions and other violations of the Sabbath rest are effectively enforced. The Lord's Day Alliance has the co-operation of the labor unions as well as of the churches in the protection of the Lord's Day. The Protestant churches in Canada exercise a very strong influence upon legislation, education, and the press. While not unaffected by modern controversy, their attitude generally has been, on the whole, conservative, while the general tone is more liberal and less aggressive than in the past.

Many old prejudices have passed away. A noteworthy illustration of this is furnished in the public worship of the Presbyterian Church, one section of which refused to use anything except the metrical version of the Psalms, regarding even the use of the paraphrases as a serious and hurtful innovation. Now all are united in the use of a hymn book which contains hymns of all sections of the Church of Christ. In many cases the worship has become

more liturgical even in non-liturgical churches. Old controversies have passed into oblivion. Greater liberty both in action and in thought is found in all communions.

It is more than possible that with this enlargement and liberty, there has been a corresponding diminution in the intensity of the religious spirit and a growing laxity within the churches which many regard with apprehension. Family worship is not observed as it once was, the children are not as familiar with the Scriptures as were their parents, and many things are tolerated in professedly Christian families which would a generation ago have been rigidly excluded. It is a time of unrest and transition. But in the midst of much change, the churches in the main hold firmly to the fundamentals of the Christian faith, and in all are found devoted men and women who earnestly follow after the ideals of truth, purity, and righteousness.

Among the Anglicans, while the Oxford or Tractarian movement has exercised considerable influence, especially among the clergy, it has seldom reached the extremes seen in England. The majority of the laity have only been slightly affected by it, and they have continued decidedly Protestant. The Presbyterians have exercised a strong influence upon the national ideals of righteousness, and have set a high standard in the education of the ministry. The Methodists have been leaders in Christian liberality and in benevolent enterprises. The Baptists and Congregationalists have borne consistent testimony to the supremacy of the individual conscience and the independence of the Church from state control. Thus each denomination has contributed essential elements to the general religious well-being of Canada, each has in its own sphere accomplished a good work and manifested distinctive excellences, the value of which is coming, more and more, to be recognized by all.

Church Unity.—The general tendency among the Protestant denominations has been toward the unifying of the Christian churches, and this appears the more remarkable when the present religious condition is compared with that of 100 or even 50 years ago, with its polemics and antagonisms. There has been a breaking down of barriers and a marked diminution of the jealousies and rivalries of the past. The old sectarian spirit has, to a large extent, disappeared and a cordial spirit of good-will has manifested itself even in those bodies which special privileges or exclusive theories had tended to separate from others. This is seen in the increasing co-operation in good works, in the frequent inter-denominational comity, and in the general attitude of the churches toward each other. It is remarkably manifested, as we have seen, in the changed attitude of most of the churches in regard to higher education. Federation of denominational colleges in a common state university has been accepted by many who were once strenuously opposed to it, as the best solution of our educational problems. In the three chief Protestant churches of Canada, the Methodist, the Presbyterian, and the Anglican (they are named in the order of their numerical strength), which are each now a unit throughout the Dominion, the tendency is toward a still larger union. Negotiations are at the present time (1904) in progress, looking toward the union of the Methodist, the Presbyterian, and the

CANADA — MILITARY EQUIPMENT

Congregational churches in Canada, and there is a reasonable possibility of some substantial result flowing from them. The very fact of the consideration of such proposals by the different bodies concerned is a striking proof of the strong tendency that exists toward the unification of the Protestant churches of Canada.

JAMES P. SHERATON, D.D., LL.D.,
Principal of Wychffe College, Toronto.

Canada — Military Equipment. The military defense of Canada, so far at least as a resident garrison is concerned, is entrusted entirely to Canadian troops, with but two exceptions, to-wit, the Imperial forces stationed at Halifax and Esquimaux, and the reason for their employment in the Dominion is found in the fact that these two ports are important British naval bases, and as such of joint importance to Canada and the motherland. In both stations the resident militia drill each year with the British regulars, so that they may form a well-trained auxiliary force to the latter if attacked. In the case of Esquimaux the Canadian government bears one half the annual expenditure for maintenance, under an arrangement with the home government. Up to this date, 30 June 1904, the end of the Canadian fiscal year, there has been practically no naval defensive force in the Dominion, the strength of the country in this respect being confined to a small number of fishery protective service and customs craft, for while the old Militia Act made certain provisions for a naval service, nothing had been done to convert the paper force into an actuality. The government of the day, however, has decided entirely to separate the land and naval militia hereafter, and a bill will shortly be introduced by the Minister of Marine and Fisheries which will be the starting point for a real defensive force operating upon Canadian waters. With regard to the land forces a very important bill has been introduced, and will this session become law; we cannot do better than deal with some of its provisions to show the present legal status of the Canadian army, and the liability of citizens to service therein.

The command in chief is vested in the king, and will continue to be exercised by His Majesty, or by the governor-general as his representative. The actual military command, however, may be given to an officer who shall hold rank not below that of a colonel in the militia or in His Majesty's regular army, subject to the regulations and under the direction of the minister of militia. Here we find a change in the law which opens the door to the highest command for officers of the Canadian militia; formerly only officers of the regular army were eligible. The new bill also gives power to appoint an inspector-general, to be charged with the general inspection of all the military forces in the country. We thus have a continuation of the old power to appoint a general officer commanding, and with it a new power as to an inspecting general, in the latter case following the recent change in army administration in Great Britain.

The general supervision and administration of the military affairs of the country is entrusted to the Minister of Militia and Defense, who must be a member of Parliament, and responsible to

that body. Power is taken in the new act to appoint a militia council to advise him in this once again following British precedent in the establishment of an army council there. This body will consist of four military and three civil members, including the Minister, who will be chairman, and will sit at the capital for the transaction of business.

All the male inhabitants of Canada from 18 to 60 years of age, the former only inclusive, are liable to military service. To this general rule there are some few exceptions, for example, judges, clergymen, professors in colleges, policemen and firemen in permanent employ as such, etc. The exempted classes would not muster more than a few thousand men in all, so this provision practically gives the males of 6,000,000 people as a supply to the militia. More than this—in cases of great emergency a *Levee en Masse* may be ordered, when all male inhabitants capable of bearing arms can be called out. Those ordinarily liable to service are divided into four classes. (1) Those 18 years of age to 30, unmarried, or widowers without children; (2) 30 years of age to 45, unmarried, or widowers without children; (3) 18 to 45 who are married, or widowers with children; (4) 45 and upward but under 60. It is in this order the male population may be summoned to the colors.

The active militia of Canada, by which is meant those actually equipped and enrolled, consists of about 42,000 men. Of these a little more than 1,000 constitute a permanent force, the main duty of which is to provide instructors for the balance of the militia in the different arms of the service at a number of schools located in various parts of Canada. On account of the rapid growth of population, especially in the West, this permanent portion of the militia is soon to be doubled in strength, the government having given formal notice of its intention in this regard. The non-permanent portion of the active militia may be called out each year for drill, for a period not exceeding 30 days; as a matter of fact, the usual annual term of instruction is 12 days. A new establishment for the militia has recently been authorized. Under this scheme the peace establishment will be greatly increased, as far as the number of officers and non-commissioned officers is concerned, and while the total number to be drilled annually will still be under 50,000 men, provision will be made to increase that number at short notice to a war strength of 100,000, as a first line of defense, with a second line of equal strength organized on paper for a somewhat slower mobilization. The increase in the peace strength of officers and non-commissioned officers above referred to will be sufficient for the war strength of the first line, with enough in excess to form the basis of the second line. In connection with this point we may state that the militia may be sent on active service "anywhere in Canada and also beyond Canada for the defense thereof," and when in time of war the "militia is called out for active service to serve conjointly with His Majesty's regular forces, His Majesty may place in command thereof a senior general officer of his regular army."

Since the conclusion of the South African war the government has been actively promoting rifle shooting throughout Canada. Rifle clubs are formed under government regulation, the members enrolling therein doing so on the

CANADA — THE ACADIAN REFUGEES

condition that in "case of emergency" they shall at once become members of the active militia. At present the membership in these clubs has passed the 20,000 mark. They are steadily growing in numbers, and as suitable locations for ranges are found these are provided. The government supplies a limited number of rifles to each club, with a fair proportion of free ammunition. It is confidently expected that in a few years these clubs will have a sufficient membership to fill the active militia to war strength.

For a similar purpose, that is, to serve as a feeder to the militia proper, the formation of cadet corps in the schools is being vigorously fostered. The boys in these organizations are given the rudiments of drill, and are instructed as far as possible in rifle shooting, miniature ranges being employed for this purpose. This movement, like that of the rifle clubs, is steadily growing. Since matters of education are under the control of the Provincial governments, the work can be carried on only with their assistance and consent; so far they have very willingly co-operated with the Dominion government. The supply of modern rifles at present in Canada is barely sufficient to arm the militia on a peace footing. To provide for the expansion of war time the government has entered into contracts for the purchase of more arms, and has even succeeded in inducing British capitalists to establish a rifle factory at the city of Quebec. This manufactory has a capacity of 12,000 rifles a year, or double that number if working night and day. Already the first of these weapons are being turned out; they are proving satisfactory. To meet the increased demand for ammunition consequent upon the extension of rifle shooting, and to provide a supply in case of war, the Dominion arsenal has been largely extended, its capacity now being six-fold what it was three or four years ago.

With a rural population very large in proportion to the whole, and chiefly engaged in farming pursuits, Canada has perhaps the best supply of material for mounted troops that can be found in any country containing an approximate number of inhabitants. Knowing this, and recognizing that numbers can, so to speak, be multiplied by speed, the government has recently converted several infantry regiments into mounted corps, and in the formation of new bodies this principle will not be lost sight of.

With the large demands which a new and expanding country always makes upon a national treasury for public works and the increase of transportation facilities, it is impossible to spend large sums upon military development. This being the case, the question arises as to how best to spend the moneys available for defense purposes. It has been felt that the solution is in establishing and perfecting, as far as possible, those more technical and scientific branches which it would be absolutely impossible rapidly to improvise. As a consequence, much attention has been devoted of recent years to the establishment of the subsidiary services. To this end the engineer corps have been increased in number and perfected in equipment, and an establishment thereof added to the permanent force. An excellent army medical corps has been created; schools of signaling are now in course of preparation; an army service corps is in being and well under way; an intelligence branch, with a thoroughly organized corps of

guides, is on the establishment; an ordnance corps has displaced the civil administration of the stores department, and a school of musketry, modeled upon the British institution at Hythe, is doing excellent and rapidly increasing service.

For complete professional training the Royal Military College at Kingston, founded in 1876, has proved of immense usefulness. While this seat of military learning is used chiefly for the instruction of cadets, long courses are also held in connection with it for officers of the militia who desire to perfect themselves in a technical knowledge of their work. Officers of the permanent force in its various branches are sent to England for courses there which the limited military resources of Canada would make it impossible to obtain in the latter country.

In conclusion, we may summarize by saying that the last decade has witnessed a very marked advance in the strength and technical training of Canada's military forces, while everything seems to point to a still further and constant improvement in the future, since the national revenues are increasing by leaps and bounds and the spirit of the people demands that a fair proportion shall be devoted to insure the safety of the country.

ANDREW T. THOMPSON, M.P.,
Lieut.-Col. Canadian Militia.

Canada — The Acadian Refugees. After the conquest of Acadia in 1710—the first and only fruit of Samuel Vetch's grand design for the conquest of Canada,—the Treaty of Utrecht (see *UTRECHT, PEACE OF*) provided for the free exercise of the Roman Catholic religion by such of the French inhabitants as were willing to remain there, but also stipulated that any who should choose might remove within a year. Nearly all remained; but, under various excuses, in the hope of a return of French power, they postponed taking the oath of allegiance to the British crown until 1730. In 1745 war broke out again, and in 1749 the founding of Halifax (q.v.) by several thousand British emigrants excited the jealousy of the officials of Canada and priests of Acadia. The people were a simple and densely illiterate peasantry, taught to obey their missionaries in everything. These missionaries were chosen and directed by the bishop of Quebec and the governor of Canada as agents of French policy, and hence a very difficult position existed, both for the English and for the Acadians. Through the promptings of the fanatical Abbé Louis Joseph Le Loutre (q.v.), and the duplicity of Governor La Jonquière of Canada and the court of France, the Indians were encouraged to murder English settlers and commit other outrages, some of the Acadians even taking part in these crimes. These charges are proved by the citations from French secret documents given in Parkman's 'Montcalm and Wolfe'; and have not been effectively answered. Le Loutre, who was vicar-general of Acadia and missionary to the Micmacs, even paid 100 livres each for English scalps in time of peace; and the money was reimbursed to him by the intendant of Louisbourg. He held constant threats of Micmac massacre over the Acadians themselves, compelling them to acts antagonistic to the English, and moving many of them from their farms and possessions to suit his plans. Yet his inhumanities were evidently justified in his own warped heart and intellect

CANADA — THE ACADIAN REFUGEES

as services to his Church and country. The people, as a whole, would have been quite content to live in peace, being very well treated. In 1751, La Jonquière issued a proclamation commanding all Acadians to enroll themselves in the French militia. A claim was put forward that only a small part of the province was "Acadia," as ceded to the British under the Treaty of Utrecht, and consequently that all the rest was still under the rule of the French. The latter now conceived the definite design of reconquering the province; but the English, obtaining exact information through the spy Pichon, struck first by capturing Fort Beauséjour, on the neck of the Acadian peninsula, on 16 June 1755. Fort Gaspereau, 12 miles distant, then surrendered, and the French fort at Saint John being burnt and abandoned on the approach of an English force, the whole country was left under British control. This entire plan of re-establishment was due to the forethought of Governor Lawrence, aided with due vigor by Governor Shirley (see SHIRLEY, WILLIAM) of Massachusetts.

The chief interest in the Acadians will always, however, be centered in the incidents of the famous dispersion, which were now about to begin. The projected French invasion had aroused the apprehension of the small British population and authorities, an apprehension deepened by the Indian outrages of Le Loutre and the fear of the neighboring stronghold of Louisbourg. The whole of the Acadians also persistently refused the oath of allegiance. In this state of affairs, which not only seemed a great danger but appeared to imply a great ingratitude, after the mild treatment and privileges of property and religion so long extended to them, it was determined by Governor Lawrence that the only safety lay in removing the Acadian population and replacing them by New Englanders. That view had been held for some time by Governor Shirley of Massachusetts and others. Lawrence had complained bitterly to the Lords of Trade before the capture of the French forts "that this lenity has had so little effect, and that they still hold the same conduct, furnishing them [the French] with labor, provisions, and intelligence, and concealing their designs from us." On the capture of Beauséjour, Lawrence exacted an unqualified oath of allegiance from the Acadians; and in response two successive deputations came to Halifax, representing together nine tenths of their entire population. Both absolutely refused to take the simple pledge of fidelity and allegiance to the British sovereign. The governor and council therefore resolved that it was necessary to deport their people, and in order that they should not strengthen the enemy, they were to be distributed among the English colonies. Lawrence now ordered Colonels Moncton and Winslow and Major Handfield,—at Beauséjour, Basin of Minas, and Annapolis, respectively,—to seize the inhabitants, and if necessary to burn their houses. The principal scenes of the expulsion took place under Winslow at Grand Pré and Fort Edward, in the Basin of Minas, just after completion of the harvest at those fair and populous settlements. At Grand Pré all the males over 10 were ordered to the parish church, where Winslow read them the order of removal and detained them as prisoners. They were kept several weeks before deportation, and the

year was nearly ended before all were gone. Tragic scenes of lamentation and distress accompanied the leaving, although it was carried out as humanely as possible. The whole number removed from the province is usually stated as a little over six thousand, although Richard and others place the figures much higher. Some took refuge in the forests or fled to the French territories. Lawrence sent the ships deporting them to the different colonies from Massachusetts to Georgia, where they became a charge on the people and their gradual departure was connived at. Many in the South eventually reached the French settlements of Louisiana, where their descendants are still found in certain parishes and were estimated at 40,000 a few years ago. The sorrows of the dispersion were great, and the death rate considerable. It is regrettable that those who reached Canada and the French West Indies suffered perhaps the most terrible miseries of all from neglect and ill-treatment. Most of the refugees at length found their way back to Nova Scotia and were progenitors of the greater part of the present French population. Their woful story was told in an idealized form in the pages of Haliburton, from whom, passing through a medium of feminine sentimentality in the pages of a lady writer, it reached Longfellow and was immortalized in his 'Evangeline.' The unhappy facts were afterward the subject of heated recriminations, especially by French writers such as Abbé Casgrain and Rameau, against the New Englanders, whose leading defenders are Parkman and Hanney. Edouard Richard in his 'Acadia' ascribes all to Lawrence personally. The dispassionate view would seem to lie in fair allowances for the difficult situation and training of the actors on both sides. In this light the Acadian population must be remembered as a densely ignorant people. Without some education, the measure of natural shrewdness they possessed could not be expected to clear up for most of them the moral problems connected with allegiance to the British crown, and the political problem of the ownership of Acadia as it was represented to them. Most of them were undoubtedly trying to be loyal to France and ready to return the country into its possession, and duplicity did not seem to them improper. This is not only deducible from all the events but plainly set forth in the petition of 3,500 Miramichi refugees to Governor de Vaudreuil in 1756.

For the Indian atrocities, to which some of them gave support, we cannot hold the people as a whole responsible. In view of these considerations the Acadian people must be regarded as unfortunate and misled, and their condition as a conquered people, torn from their compatriots and coreligionists by the fortune of war, as they hoped only temporarily, must be considered. As in the case of ignorant populations generally, it is chiefly their leaders and advisers—Le Loutre, Jonquière, and the bishop of Quebec—who must be held responsible. Regarding Le Loutre, although his character of the peculiarly savage and relentless fanatic led him into acts which place him among the class of murderous criminals, his guiding motives appear to have been a distorted patriotism and allegiance to his religion. These are in a different class from the mean duplicities and false quibbles of La Jonquière and the French ministry, who were well aware both of the untruth

CANADA — THE QUEBEC ACT

of their pretensions concerning the extent of Acadia, and of the dangerous position in which they were placing the Acadian people. When we examine the motives of the British side, we have to deal with practically only Lawrence and his council at Halifax. A state of war existed, and in their judgment desperate measures were necessary for the safety of the little British colony. The British settlers were greatly outnumbered and held but a small part of the country. Le Loutre and the French authorities were pursuing a treacherous course of savage murder against them, with Acadian participation. The entire people absolutely refused to take a simple oath of allegiance, although repeatedly and plainly warned of the consequence. In Lawrence's judgment no other course than deportation then seemed safe; and although a harsh measure, like its modern analogue, Reconcentration, it proved effectual in removing all doubt respecting the security of the colony. Harsh and drastic as his measures were, he is entitled to be judged, in part at least, as a military man bound to perform a duty; and his freedom of discretion at a difficult juncture must be respected even if it may have been badly used. On the side of France, two instances of a similar deportation policy are cited in defense — the proposal of Governor de Callières, endorsed by the French king in 1689, to seize the Province of New York and deport all the Protestant population (Doc. Hist. N. Y., Vol. I, pp. 285-297); and the actual deportation of the English settlers from the Island of St. Kitts in 1666, to the number of 2,500, an occurrence marked by the striking of a medal by Louis XIV., inscribed "Ang. Ex Insula St. Christoph Exturbat."

Canada—The Quebec Act. From the capitulation of Montreal in 1760 down to the ratification of the Treaty of Paris in 1763 Canada was without any form of civil government, the affairs of the colony being administered by the officer in command of the British armies of occupation. But with the conclusion of peace and the definite cession of the colony to the British Crown this tentative arrangement came to an end and in the autumn of 1763 a royal proclamation decreed the establishment of a civil government in the newly-acquired colony, promising that as soon as circumstances would permit, representative assemblies would be convened. In the meantime the laws of England were to be in force. In virtue of this arrangement General James Murray (q.v.) was appointed to the gov-

ernorship of the colony and a council of eight members was nominated to assist him in the work of administration. For the time being, justice continued to be administered by the military courts at Quebec, Three Rivers and Montreal but in September 1764 a proclamation was issued by the Governor-in-Council establishing a court of King's Bench for the trial of all causes, both civil and criminal, agreeably to the laws of England which the royal proclamation of the preceding year had declared to be in force. At the same time a court of Common Pleas was established for the trial of actions which had arisen before the publication of the proclamation of 1763 and in regard to which the old French law had to be applied.

The immediate result of this change was to inaugurate a régime of utter judicial chaos, for the new judges were completely at a loss to apply the principles of English common law to the causes which came before them, especially where questions of real property were concerned. Accordingly, the Governor-in-Council during the month of November 1764 issued a further proclamation declaring that "in all actions relative to the tenure of land or the rights of inheritance, the French laws and usages shall be observed as the rule of decision." But in all other civil cases and in all criminal cases the common law of England was to be applied. This change improved matters but slightly for the new English judges were slow to master the intricacies of French law and applied it very imperfectly where they endeavored to make it apply. To the application of the English criminal law the French inhabitants of the province made no great objection, although for the time being many of them failed to take kindly to the institution of trial by jury; but there was a widespread demand for the extension of French law to all civil causes. Complaints were likewise made that the judicial officers of the colony were for the most part ignorant of the French language; that they were often dishonest and that the legal fees charged the inhabitants were exorbitant. For all of these complaints there seems to have been considerable foundation and in fact the law officers of the Crown in England reported a recommendation that the French language should be restored in judicial proceedings and that the old French law should be extended to all civil cases.

Matters rested as they were until the appointment of General Sir Guy Carleton (q.v.) to the post of Governor in 1767. The new Governor was not long in grasping the situation and in deciding that the restoration of the whole fabric of French civil law would be advisable. To this end he had the *coutume de Paris* of the old régime carefully re-edited by several colonial jurists of acknowledged ability and the revised text at once became the acknowledged source of law in all cases of land tenure and inheritance. Carleton pressed his proposal on the home authorities and in 1770 went to England to urge its adoption. There he managed to secure the appointment of a commission to examine into the merits of the whole matter and the report of this body, although it was not presented until the closing days of 1772, was on the whole in favor of the Governor's recommendation. In the meantime, however, there was a growing demand among the British inhabitants of the colony for the establishment of a

CANADA—THE ASHBURTON TREATY

representative assembly in accordance with the promise made in the proclamation of 1763. At meetings of the British inhabitants resolutions calling upon the Home authorities to take steps in this direction were passed and forwarded to England. But to the adoption of such a step there was grave difficulty, namely, the decision of the question as to whether Roman Catholics would be permitted to sit in the new Assembly. The disabilities of Roman Catholics had not been removed in England at this time and it was hardly to be expected that Parliament would extend to Roman Catholics in a colony privileges which it denied them at home. On the other hand, an assembly from which Roman Catholics were excluded would be very far from representative in a colony where nine-tenths or more of the population professed that religion. This difficulty, together with the fact that the position assumed by the representative assemblies in the British colonies on the Atlantic seaboard at this time was not calculated to inspire the Home authorities with a favorable regard for popular colonial representation, seems to have determined the Ministry in its decision that Canada, for the time being, should not be trusted with an assembly representing the people. On some other points, however, the home authorities evinced a desire to meet the wishes of the colonists.

On 2 May 1774 a bill, popularly known as the Quebec Bill, was introduced into the House of Lords where it passed with little opposition. In the House of Commons the measure was vigorously opposed by a strong minority, but with some amendments was eventually passed, and towards the end of June received the royal assent. By the provisions of the Act the boundaries of the Province of Quebec were extended to include all ancient Canada, including Labrador, and all the territory lying north of the Ohio and west of the Mississippi. Roman Catholics were released from all penal restrictions; the obligation of the tithe was reimposed in favor of the Church, and all classes, with the exception of the religious orders were confirmed in the full enjoyment of their proprietary rights. French law was hereafter to be applied in *all* civil cases while the law of England was retained for the decision of all criminal causes. Both, however, might be modified by ordinances of the Governor and Legislative Council. Inasmuch as it was "inexpedient to call an Assembly" the Act provided for the establishment of a Legislative Council to consist of not less than 17 nor more than 23 members nominated by the Crown. To this body in conjunction with the Governor was given a limited power of internal administration including the right to levy internal and local taxes. But Parliament expressly reserved to itself the right of external taxation and every ordinance passed by the Council was to be transmitted to England where it might be disallowed if the home authorities deemed advisable.

In the New England colonies the passage of the Quebec Act was bitterly resented, partly because of the privileges which it granted a French and Roman Catholic population but more especially because it placed under the almost complete control of the British authorities the vast expanse of territory west of the Alleghanies in the conquest of which the seaboard colonies had borne a heavy share. In Quebec the French inhabitants, while many regretted that provision

had not been made for the establishment of a popular assembly open to Roman Catholics, for the most part welcomed the substantial concessions which the Act conveyed. There is little doubt that these concessions served in some measure to assure the British authorities of at least their neutrality during the turbulent days of the next few years. The British inhabitants of the province, on the other hand, were naturally disappointed but the course of events during the next half-decade was such as to preclude any important manifestation of their feelings. Under the provisions of the Quebec Act the administration of the province was carried on for the ensuing 17 years.

Canada—The Ashburton Treaty. The Ashburton Treaty (also called Treaty of Washington), a treaty between the United States and Great Britain, signed 9 Aug. 1842, is chiefly important for its settlement of the Northeastern boundary question. The boundary between Massachusetts (subsequently Maine) and British North America had been in dispute since 1783. The treaty of that year (Art. 2) had made the following provision: "And that all disputes which might arise in future on the subject of the boundaries of the said United States may be prevented, it is hereby agreed and declared, that the following are and shall be their boundaries, namely, from the northwest angle of Nova Scotia, namely, that angle which is formed by a line drawn due north from the source of the Saint Croix River, to the Highlands; along the said Highlands which divide those rivers that empty themselves into the river Saint Lawrence from those which fall into the Atlantic Ocean, to the northwesternmost head of the Connecticut River; east, by a line to be drawn along the middle of the river Saint Croix, from its mouth in the Bay of Fundy to its source, and from its source directly north to the aforesaid Highlands which divide the rivers that fall into the Atlantic Ocean from those which fall into the river Saint Lawrence." The article was doubtless drawn in good faith, but owing to the imperfect knowledge of the geography of the territory concerned, its meaning was soon involved in doubt. The identity of the river Saint Croix, the location of the Highlands referred to, and the ownership of the Passamaquoddy Islands became matters of dispute. The identity of the Saint Croix was settled by a commission in 1798, appointed under the Treaty of 1794. Under the Treaty of Ghent (see GHENT, TREATY OF) (1814) a commission was appointed which settled the Passamaquoddy question by compromise (1817). But the demarcation of the inland boundary seemed long impossible of solution. The American claim located the "northwest angle" at the point where the line due north from the source of the Saint Croix met the Highlands between the rivers flowing into the Saint Lawrence and those flowing into

CANADA—THE ASHBURTON TREATY

the Atlantic; this established the angle in question "at a place about 144 miles due north from the source of the River Saint Croix, and about 66 miles north of the River Saint John" (United States commissioner, 4 Oct. 1821). The extreme British claim (at any rate after 1814) placed the angle "at or near the mountain or hill called Mars Hill, distant about 40 miles on a due north line from the source of the River Saint Croix, and about 37 miles south of the River Saint John" (note of British commissioner 4 Oct. 1821). In each case the boundary proceeded westward and southward along the Highlands to the head-waters of the Connecticut. Between the two there thus lay a disputed territory of 12,000 square miles. After fruitless negotiations a convention of 27 Sept. 1827 referred the boundary to the arbitration of the king of the Netherlands. His award, however, in 1831 was rejected by the United States.

Meantime the district of Maine had become (1820) a State, and was eager in the defence of its claim to the disputed region. The progress of settlement naturally led to conflict and disturbance on the border line, known as the "Aroostook War." By the year 1840 matters had reached an apparent deadlock in which the adoption of a conventional line seemed the only solution. In addition to the northeastern boundary, various other matters of controversy were outstanding between the two nations. The English claim of a "right of search" for the suppression of the slave trade created a standing difficulty. The destruction of the *Caroline* (q.v.), an American vessel, by a party of Canadians during the revolt of 1837 had led to a demand for redress. The British government had met this claim by asserting that the destruction of the vessel was a legitimate act of war, the *Caroline* having carried supplies for the insurgents. A Captain McLeod, a Canadian, accused of participation in the affair, was arrested and brought to trial in New York; in all probability nothing but his acquittal prevented actual hostilities. A further complication had arisen in the case of the *Creole*, a slave ship on which the negroes had revolted (1841), and which they had carried to a British port in the West Indies, where they were allowed to go unmolested. There was also in question the boundary of Oregon. To settle these various points at issue, Lord Ashburton (see ASHBURTON, ALEXANDER BARING, LORD) was sent to Washington (April 1842) and in conjunction with Daniel Webster, secretary of state, arranged the treaty commonly known by his name. Ashburton, formerly Mr. Alexander Baring, a prominent financier, and for nearly 20 years a member of the House of Commons, had previously resided in America, where he married a daughter of Senator Bingham. His known desire for a good understanding between Britain and America rendered his relations at Washington most cordial. He was widely entertained, and is said to have "spread a social charm over Washington, and filled everybody with friendly feelings toward England." With Webster his relations were especially amicable, and their negotiations assumed an altogether informal character. (See Schouler, *History of the United States*, Vol. IV., ch. xvii.) To this fact has been partly due the impression ever since prevalent in Canada that the inter-

ests of that country were sacrificed to the expansiveness of Lord Ashburton's feelings. Under the terms of the treaty, the northeast boundary was settled thus (Art. I.): "It is hereby agreed and declared that the line of boundary shall be as follows: Beginning at the monument at the source of the River Saint Croix, as designated and agreed to by the commissioners under the fifth article of the treaty of 1794, between the governments of Great Britain and the United States; thence north, following the exploring line run and marked by the surveyors of the two governments in the years 1817 and 1818, under the fifth article of the Treaty of Ghent, to its intersection with the River Saint John, and to the middle of the channel thereof; thence up the middle of the main channel of the said River Saint John into the mouth of the River Saint Francis; thence up the middle of the channel of the said River Saint Francis, and of the lakes through which it flows, to the outlet of the Lake Pohenagamook; thence southwesterly in a straight line to a point on the northwest branch of the River Saint John." This locates the main part of the boundary; for details of the further extension of the line, the text of the treaty may be consulted ('Treaties and Conventions,' Washington 1889; 'Annual Register,' 1842). The treaty provided further for the survey and permanent marking of the boundary, which was completed in 1847. Of the disputed territory the United States received about seven twelfths and Canada five twelfths. Rouse's Point, on Lake Champlain, was also declared to belong to the United States, the government of that country binding itself to pay to Maine and Massachusetts \$300,000 on account of the relinquished territory. The right to carry timber down the Saint John River was granted to the United States. By Article 8 of the treaty, it was agreed that each country should maintain on the coast of Africa a sufficient naval force, carrying not less than 80 guns for the purpose of enforcing, separately and respectively, the laws, rights, and obligations of each contracting party for the suppression of the slave trade. The treaty passed over the *Caroline* and *Creole* cases (see CREOLE CASE), but declared (Art. 10) that "each party, on requisition from the other, shall deliver up to justice persons charged with murder, assault with intent to murder, piracy, arson, robbery or forgery, upon sufficient proof of their criminality." The question of the Oregon boundary was also omitted.

The boundary award of the treaty met with great dissatisfaction in Canada. It was currently believed, and the belief largely persists, that the interests of Canada had been unduly sacrificed. The Canadian view of the case is presented in Dent's 'Last Forty Years of Canada' (1881), and in more extreme form in Coffin's 'Quirks of Diplomacy' (1874). The supposed sacrifice of Canada by Lord Ashburton has become a commonplace of Canadian political discussion. Later investigation, however, is strongly in favor of the American claim. The whole subject of the boundary has recently been exhaustively treated in an admirable paper by Dr. William Ganong of Smith College ('Proceedings of the Royal Society of Canada,' 2d series, Vol. VII., 1901). Dr. Ganong, though a Canadian, decides that Maine was right and New Brunswick wrong in the

CANADA—THE CLERGY RESERVES

northwest angle controversy. He bases his decision on the text of the treaty of 1783, on the maps of the time, on the admissions of Governor Carleton and others, and on a petition of the New Brunswick legislature of 1814, virtually admitting the American claim. The Mars Hill boundary line was not advanced, he says, until 1814. In the controversial discussions of the treaty the episode of the "red line" map has played a considerable part (see 'North American Review,' April 1843, and Winsor's 'America,' VII. 180). This was a map found in the French archives and supposed to have been given to Vergennes by Franklin in connection with the treaty of 1783. A boundary line favoring the English claim was marked upon it in red ink. A copy of this map was in Webster's possession during the negotiations but was not shown by him to Lord Ashburton. It was shown by him to the Maine commissioners; played some part in securing their assent to the Ashburton Treaty." But it is not proved that the marking of the map was by Franklin, and it is also possible that it was wrongly marked with intent to deceive (see Hinks, 'Boundaries Formerly in Dispute,' 1885). To offset this map, the original of which has disappeared, there is still in the British Museum an English map favoring the American claim. Canada—The Clergy Reserves. The clergy reserves were lands set apart, by virtue of the constitutional act of 1791, for the maintenance of the Protestant clergy in Upper and Lower Canada. The intention of the act was to reproduce in the colony an episcopal establishment similar to that of Great Britain, to whose primate it was to be subordinate. The provincial governors were directed under the act to reserve one seventh of the land for the support of the Protestant clergy. The reserved blocks of land were to be distributed among those granted to settlers. In Upper Canada a full seventh of all the land was to be granted. In Lower Canada reserves were to be made only in proportion to new settlement and not in respect of lands already occupied. No reservations were made in the latter province until 1796. Reservations were made each year until 1838 (except in 1813). The total reservations made in Lower Canada amounted to over 930,000 acres: in the Upper Province to about 2,400,000 acres. The crown was also empowered to authorize the lieutenant-governor of each province from time to time to erect parsonages, to endow them with a portion of the reserve lands and to present incumbents to them (constitutional act, Secs. 38, 39, 40). The operation of the system thus established was not at first felt as a serious grievance. Land being still plentiful, the reservations remained unsold and were leased at extremely low rentals (10 shillings for 200 acres during first seven years). With the progress of settlement however the rentals constantly rose. The question of the clergy reserves became a subject of increasing complaint. The members of the Church of England were in a decided minority, not only in the Lower Province, but in Upper Canada itself. The ques-

tion early arose whether the wording of the act,—"allotment and appropriation of lands for the support of a Protestant clergy"—could not be construed in favor of the Presbyterian and Dissenting denominations. The matter being referred to the home government, the law officers of the crown decided (November 1819) that the Scotch Church had a claim for a share of the rentals, but that no other denominations had a claim at all. The irritation thus caused rendered the question one of acute difficulty during the succeeding thirty years, and has been designated by Dr. Bryce, the Canadian historian, the "Thirty Years' Religious War in Upper Canada." The distribution of the population of Upper Canada among the different denominations in 1839 was as follows: Church of England, 79,754; Methodists, 61,088; Presbyterians, 78,383; Roman Catholics, 43,029; Baptists, 12,968; others, 57,572. The claims of the Church of England were stoutly upheld by the Rev. John Strachan, subsequently Bishop of Toronto (1839). Egerton Ryerson (see RYERSON, A. E.), a young Methodist minister, strove with equal zeal on behalf of the Methodist Church.

In 1827 the assembly of Upper Canada asked the crown to devote the reserves to the creation of schools and of churches of all denominations. The same request was repeated in each of the three following years with considerable popular agitation. Meantime the endowment of rectories as provided by the act of 1791, was authorized by instructions from the crown in 1825. The excited state of public feeling delayed for some years the execution of this project, but in 1836, 54 rectories were endowed with 400 acres each. The discontent thus caused helped to precipitate the rebellion of 1837. With the suppression of that movement the question of the clergy reserves still earnestly demanded solution. An act of the legislature of Upper Canada in 1839, proposing to re-invest the reserves in the crown, was disallowed by the home government. In the following year the legislature passed an act for the sale of the reserves, one half of the proceeds to go to the Churches of England and Scotland, and the other to be divided among the other religious denominations. This again was abortive, the British judges, on question by the House of Lords, deciding that the provincial legislature had exceeded its authority. The Imperial Parliament now intervened and passed an act (7 Aug. 1840) for the settlement of the question. Part of the reserves had already been sold by authority of a statute of 1827. The proceeds of these sales were to be divided between the Churches of England and Scotland, the former receiving two thirds: the unappropriated lands (1,800,000 acres) were to be sold, and the amount realized to be invested, one half of the interest being given to the two above churches, in the proportion already mentioned, the other half to be applied by the governor and executive council for public worship and religious instruction. The income thus accruing was divided in the ensuing years among the churches of England and Scotland, the Wesleyan Methodist, Roman Catholic and Synod Presbyterian churches and the United Synod Presbytery. The question was still far from settled. It was claimed that the lands were sold by the crown at insufficient prices, and Bishop Strachan led an agitation for the sharing up of the lands themselves. The assembly refused to petition the

CANADA — SEIGNIORIAL TENURE

crown to this effect, but demanded the repeal of the act of 1840. The Imperial Parliament complied by a statute of 1853, which placed the reserves in the control of the Provincial Parliament (the two Canadas being now united). The Canadian Parliament elected in 1854 strongly reflected the general public feeling in favor of secularization. A statute to that effect was passed. A lump sum of £188,342 was paid to the Church of England, representing the guarantee of stipends then charged on the reserve fund, called for by the imperial act. The reserved lands were sold and the proceeds given to the municipal authorities for education and local improvements. Consult: Lindsay, 'The Clergy Reserves' (1851); 'Memoir of Bishop Strachan' (1870); Ryerson, 'Story of My Life' (1883).

STEPHEN LEACOCK,
Lecturer in Political Science, McGill University.

Canada — Seigniorial Tenure. The system of Seigniorial Tenure was that system of public and private relations based upon the tenure of land which the French government undertook, during the course of the 17th and 18th centuries, to introduce into its North American colonies, and more especially into the colony of New France, now Canada. The system of feudal—or as in its later stages it came to be called—seigniorial tenure, was deeply rooted in France, and it is easy to understand how its introduction into the colonies appealed to Richelieu as a means of providing estates for many of the landless aristocrats of France. Moreover as feudalism was now so far advanced in decay as to be no longer a menace to the central power, it is easy to see how the system appealed to the Bourbon monarchs as likely to permit, in the colonies, of that centralization of authority which characterized France at this time.

As regards Canada, the seigniorial system had its origin in 1627 when the French King granted to the Company of New France, more commonly known as the Company of One Hundred Associates, the whole of the French possessions in North America as one immense fief with full power to sub-grant it in seigniories to settlers. During the whole 35 years of its existence, however, this Company devoted almost its entire attention to the development of the lucrative fur trade; very few settlers were sent out to the colony, with the result that while over 60 *in extenso* grants of seigniories were made, almost none at all were ever taken possession of by the grantees. But in 1663 the Company was compelled to surrender its charter and extensive territorial rights, the Crown taking into its own hands the supervision of colonial affairs and providing New France with a royal government corresponding roughly to that established in the French provinces at home. From this time on settlers came in increasing numbers; power was given the colonial Governor and Intendant to make grants of seigniories subject to royal ratification, and during the last quarter of the 17th century these were made freely. In no case were grants made to absentees; each applicant for a seigniorial grant had to prove himself a *bona fide* colonist. Large numbers of the settlers were sent over at the royal expense and once in the colony, every inducement was given them to remain. Even the detachments of French regular troops sent out to the colony

were disbanded there and both officers and men were encouraged, by liberal grants both of land and money, to become permanent residents of New France.

As to the size of the seigniories granted, there was no fixed rule: they varied from small plots containing a few square *arpents* to huge tracts ten by twelve leagues in area. Much depended on the position occupied by the settler before his immigration to the colony and upon the available means which he had for the development of his grant. But whatever the area of the grants, they almost invariably assumed the same shape,—that of a parallelogram with the shorter end fronting on the river. On receiving his grant the new seignior was under obligation to repair at once to the Château de St. Louis in Quebec, there to render his fealty and homage to the Governor as the representative of the Crown. Within the next forty days he was required to file with the Registrar-General his *aveu et dénombrement*, or statement showing clearly the location, extent and nature of his seignior. A similar statement containing full information regarding the development of the holding was required every time the seignior changed owners. No payment was exacted from the seignior in return for the original grant, but an exaction known as the *quint* became payable on each mutation of ownership by sale, gift, or inheritance other than in direct succession. This amounted to one fifth of the estimated value of the seignior, but of this amount it was the custom of the Crown to give a rebate of one third. As the seigniories increased in value very slowly this burden was never an onerous one. In making the grants, the authorities usually reserved the right of taking, from the granted seigniories such locations as might at any time be found necessary for the construction of fortifications or other public works, such oak and pine timber as might be found suitable for use in the royal shipyards and the right to a share in all mines and mineral deposits found in the seignior.

In France the seignior was under no obligation to sub-grant the lands within his seignior, but by a series of royal edicts,—more notably the Edict of Marly (1711), this obligation was imposed upon the seigniors of New France in the interest of colonial development. From 1711 onwards it was incumbent on all seigniors in Canada to sub-grant portions of the unoccupied lands of their seigniories to any settlers who applied for such grants, on whatever terms were customary in the neighborhood without exacting any bonus or *prix d'entree*. If the seignior refused to do this, power was given the Governor and Intendant to step in and to make the grant, the seigniorial dues in such case to become payable to the Crown. Furthermore, from time to time various edicts revoked or curtailed the grants made to such seigniors as did not seem to be showing sufficient zeal in having their lands granted to settlers. In this way every seignior was compelled to become, after a fashion, the immigration agent of the colonial authorities, and it was this particular feature which serves most prominently to differentiate the seigniorial system in Canada from its prototype at home.

Grants made by the seigniors to settlers were called grants *en censive*. These likewise varied

CANADA — SEIGNIORIAL TENURE

considerable in size, but almost invariably assumed the same shape as the seigniority within which they lay. Over them the seignior retained a variety of rights, some financial, some judicial, and some merely ceremonial or honorary in their nature. Among the former was the annual payments known as the *cens et rentes*, the former payable in money, the latter usually in produce. The *cens* was a very small due, amounting usually to a few *sous* per superficial *arpent* and valuable to the seignior mainly as establishing his claim to other and more important rights. The *rentes* was payable annually in grain, cattle or poultry but might be commuted by agreement of the parties into a fixed money payment. Then there was the *lods et ventes*, a mutation fine payable at every change of ownership. This amounted to one twelfth of the mutation price, and of it the seignior usually remitted one fourth, although he was under no legal obligation so to do. To guard himself against loss of his proper *lods et ventes* through sales of *en censive* holdings at less than their actual value, the seignior possessed the *droit de retrait* by virtue of which right he might pre-empt any holding thus sold by payment to the purchaser of the mutation price, within forty days from the date of the sale. Then there was the *droit de banalité* or the exclusive right of the seignior to erect a grist mill within the limits of his seigniority and to compel his *censitaires* to have their grain ground there and not elsewhere on pain of confiscation. The amount of toll receivable for this service was fixed by a royal edict at one fourteenth of the grain ground. During the greater part of the French régime this incident bore more heavily upon the seignior than upon his *censitaires*, for except in the more populous seigniories, the amount of toll received rarely sufficed to pay expenses. At the same time the colonial authorities compelled the seigniors to provide mills in their seigniories on pain of losing the right for all future time. Finally, there was the much-detested *corvée*, or right of the seigniors to exact from their *censitaires* a certain quota of labor on the seigniorial lands without compensation. The amount allowable varied in different seigniories but as a rule the *censitaires* were permitted to commute it into a fixed money payment. An ordinance of the Superior Council in 1716 forbade the exaction of *corvée* during seed time and harvest. In addition to the foregoing main rights the seignior ordinarily reserved for himself the privilege of taking from the lands of the *censitaires* such wood and stone as might be found necessary in the erection of the seigniorial manor house, mill or church, and in some cases the right of taking wood for fuel. In many cases he likewise reserved the right of claiming a share in all the fish caught by his *censitaires* in the waters of the seigniority.

Most of the seigniors possessed certain judicial rights. These, however, were not inherent in the ownership of a seigniority, but were specifically granted by the Crown. This grant might convey merely the right of *basse justice* in which case the seignior was empowered to deal with minor causes in which the amount in dispute did not exceed a few *sols*. The grant of *moyenne justice* gave him a large jurisdiction, while the grant of *haute justice* gave full judicial power in all cases except those such as

treason and counterfeiting in which the Crown was directly concerned. As a rule all three degrees of judicial power were conferred on the seignior. But in every case an appeal lay to the royal courts of the colony. As the exercise of his judicial powers brought the seignior very little profit the seigniorial courts never became a very important element in the colonial judicial system.

The remaining rights of the seignior were merely honorary and afforded him no financial return. He was entitled to the fealty and homage of his *censitaires*, to a front pew in the parish church, to certain precedence at the Sacraments, to the erection of a Maypole at his door each Mayday and, in general, to the respect and deference of his dependents. A number of seigniors who showed zeal in the development of their holdings received patents of nobility but it must be borne in mind that the possession of a seigniority in New France did not of itself give noble rank. Herein Canadian feudalism again differed from its prototype in France. The French seignior was always a noble; the Canadian very rarely.

At the close of the French régime nearly eight million *arpents* of land had been granted out to be holden under the seigniorial tenure. The system had become so deeply rooted in the colony that the English authorities, after the Conquest, did not venture to take the drastic step of supplanting it in favor of the English system of tenure in free and common socage. The old system was allowed, therefore, to remain intact but as the colony became more thickly settled, many of the seigniorial exactions became burdensome. The *droit de banalité* became especially so. Moreover, the new English courts failed utterly to afford the *censitaires* that protection against the seigniors which the authorities of the old régime had given. From time to time the Legislature of Lower Canada sought to deal with the growing complaint that the operation of the system was retarding the development of the province but found it extremely difficult to devise any plan which would be satisfactory to the tenants and at the same time protect the vested interests of the seigniors. In 1825 an Act was passed giving to the parties concerned the right to commute all seigniorial dues into a lump sum by mutual agreement but very few took advantage of the legal permission thus accorded. It was not until 1854 that by the Seigniorial Tenures Abolition Act a general scheme for the compulsory commutation of all seigniorial obligations received the assent of the Canadian Legislature. This Act provided for the establishment of a Special Court to determine just what seigniorial claims were justifiable and on a basis of its decisions each seignior was awarded a certain indemnity for the loss of his rights. Part of the amount was paid him from the public treasury; the balance became an annual rent charge on the lands of the tenants, which annual charge, again, might be commuted into a lump sum if the tenant so desired. In any case all lands formerly holden *en seigneurie* or *en censive* were thereafter to be holden in fee simple. Thus by one stroke of legislation the whole system of territorial law in Lower Canada was revolutionized and the last vestige of Canadian feudalism disappeared.

Canada — The Hudson's Bay Company.*

This great trading company has been in operation under its present charter for two and one third centuries. Its charter, which is a very generous one, was given by easy-going Charles II. The company owes its origin to the adventures in the New World of two French Huguenots, Pierre Esprit Radisson and Medard Chouart (afterward Sieur de Groseilliers, or familiarly "Mr. Gooseberry"). It is claimed that in 1662 these daring spirits reached James Bay, the southern lobe of Hudson Bay. This is entirely improbable, as in that year they are known to have been in Lac des milles Lacs, now northern Minnesota. (See the discussion on this matter in the author's 'Remarkable History of the Hudson's Bay Company.') Persecuted in French Canada, the adventurers fled to New England and thence to England, where they had an audience with the king, and through the influence of Prince Rupert (see RUPERT, PRINCE), the king's cousin, a strong company was afterward formed, being created by royal charter. The first expedition to Hudson Bay was made for the adventurers in the ship *Non-such* Ketch, Capt. Zachariah Gillam, a New England mariner. Arrived at the destination, a fortress was erected on James Bay (lat. 51° 20' N., lon. 78° W.), called Charles Fort. On the return of the vessel to England the charter was granted (1670). Prince Rupert was made the first governor, and the vast territory covered by the charter became known as Rupert's Land. He was followed by the king's brother, James, Duke of York, and the third governor was the famous Duke of Marlborough, who has left his family name on Fort Churchill. England's great rival, "La Belle France," immediately began to lay claim to the bay as a part of Canada. Several expeditions were sent out to drive off the English, the most notable being that under Pierre Le Moyne d'Iberville. See IBERVILLE, PIERRE LE MOYNE D'. He achieved so great a naval victory that the whole bay fell into French hands, comprising at that time seven forts, of which Charles, Nelson, Moose, and Albany were the chief. The territory under dispute was restored to England by the famous treaty of Ryswick, 1697. Up to the time of the French forays rich dividends had been declared by the partners, that of 1690 being 75 per cent of the original stock, and the king's share was rendered in guineas instead of pounds. The com-

pany, which included many distinguished men, such as the Duke of Albemarle (Gen. Monk), (see MONK, GEORGE), and Sir George Carteret (see CARTERET, SIR GEORGE) was very influential. Prince Rupert presided at the London meetings, and a sub-committee met regularly to buy and sell, went to Gravesend to see the goods shipped, the men paid, and the like, in the good ships *Prince Rupert*, *Wyvenhoe*, or *Bark Craven*, which sailed around the north of Scotland and thence to Hudson Bay. Every year, about 1 June, for more than two hundred years, one ship at least has cleared for its northern port on the bay, latterly generally *York Factory*. How small the beginnings of trade were may be seen in the inventory of goods sent out in 1672: "Two hundred fowling-pieces, and powder and shot; 200 brass kettles, size from 5 to 16 gallons; 12 gross of knives; 900 or 1,000 hatchets." In October the ship returned with its valuable cargo of furs, which was sold in London, often by auction.

The second period of Hudson's Bay Company history is that involving the local opposition in England to the traders. Between the treaties of Ryswick (1697) and Utrecht (1713), the menaces of the French destroyed the fur trade, but after the latter treaty, from which time the bay has remained continuously English, the affairs of the company improved. This roused the envy of a number of merchants, a leader among them being an Irish gentleman named Arthur Dobbs. He advocated an expedition to explore the Northwest Passage, raised by subscription a large sum to send out a ship to rival the company, and though his expedition did not accomplish much, yet the Hudson's Bay Company was disturbed, was put on its mettle, and the struggle as recorded in the Government bluebook of 1749 became very interesting. A more serious movement, however, began in French Canada. The charter of the company gave it the trade of all the lands and streams within "Hudson's Streights," with one most important limitation, namely, except those "which are not now actually possessed by any of our subjects, or by the subjects of any other Christian prince or state." Long before the Hudson's Bay Company penetrated Rupert's Land, the French ascended the Great Lakes, and 20 or 30 years before the English had reached the Saskatchewan River from Hudson Bay, explored the river system of Rupert's Land and came in sight of the Rocky Mountains. This feat was accomplished by Sieur de la Verandrye, who in 1738 caused a fort to be erected on the site of the present city of Winnipeg, and took possession of the country for the king of France. The conquest of Canada by Wolfe put an end to this French occupation, but as later discussions show left it a part of Canada. Soon after the conquest of Canada, however, a critical movement took place in the effort of the Hudson's Bay Company to penetrate the interior from the bay, on whose shores for nearly a century it had lain in slumber. This advance was under the leadership of one of the captains of exploration, Samuel Hearne, a Hudson's Bay Company officer, sometimes called the "Mungo Park of Canada." Hearne discovered the Coppermine River and followed it to its mouth on the Arctic Sea. He, too, first of white men saw Great Slave Lake. But, also, shortly after the transfer of Canada from France to England,

*The charter of this company is given to the "Governor and Company of Adventurers of England trading into Hudson's Bay." From this it has been usual to employ the title "Hudson's Bay Company," using the possessive form of the name of Hudson, the discoverer. The bay itself, as in the case of Hudson River, has its name spelt by the geographers without the apostrophe and s.

CANADA — THE HUDSON'S BAY COMPANY

Scottish traders from Montreal began to ascend the waterways of Canada, and to pass from Lake Superior on to Lake Winnipeg and the Saskatchewan River, the very centre of Rupert's Land. Alexander Henry (1760), Thomas Curry, James Finlay, and the brothers Frobisher, traders from Montreal, led the way and reached the Saskatchewan. Hearne from Hudson Bay heard of the Canadian traders having built a fort at Sturgeon Lake, and two years later (1774) accepted the gage of battle, and built Fort Cumberland alongside of his rivals on the Saskatchewan. The war of the giants had now begun, and for well-nigh 50 years it raged with increasing rancor and bitterness. Out of the movement of the Scottish merchants named, from Montreal, grew the union of traders (1783-4) known as the North-West Company. Its leading traders were Frobisher, Mackenzie, McLeod, McGillivray, Grant, Cameron, and greatest of all Simon McTavish — familiarly called "Le premier," and the founder of the North-West Company. The magnates of this great company Washington Irving has characterized as the "Lords of the Lakes and Forests." Their trade was enormous and extended to the coast of the Pacific Ocean itself. Toward the end of the century (1795-9) one year's production of furs was 106,000 beavers, 32 martens, 11,800 mink, 17,000 musquash — counting altogether 184,000 skins. At this time the North-West Company employed besides officers and partners, 50 higher clerks, 71 interpreters and clerks, 1,200 canoemen, and 35 guides. But the Hudson's Bay Company was not to be beaten. They were able to carry goods from the sea-coast of Hudson Bay to the inland parts of Rupert's Land earlier in the season, even in the Red River districts, than the Nor'-Westers were able to do by the long river and lake route from Montreal. They duplicated all the forts of the North-West Company. The confusion became worse confounded when the North-West Company divided (1796) into two rival factions, the rebels forming themselves into the "New North-West Company" or "Alexander Mackenzie and Company," more familiarly, however, known as the "XY," the name being from the letters of the alphabet following the initials of the old company NW. The young company was intensely active, and about this time, but only for a short period, the introduction of dangerous amounts of strong drink took place among the Indians. After eight years of unprofitable trade the two sections were reunited as the "North-West Company."

Early in the 19th century a new problem arose. A Scottish nobleman, the Earl of Selkirk, obtained control of the stock of the Hudson's Bay Company and proceeded to settle up the fertile lands along the Red River, bringing his colonists chiefly from Scotland by way of Hudson Bay. This invasion of the fur-country (1812-15) by farmers the Nor'-Westers strongly resented. They several times drove out, or inveigled away many of the Highland settlers, who were beginning to till the soil within two or three miles of the site of the present city of Winnipeg. Two forts represented the opposing parties — Fort Gibraltar, the North-West Company fort — Fort Douglas, the Lord Selkirk stronghold. The descendants of the Nor'-Wester French voyageurs, whose mothers were Indian women, were now becoming numerous and went

by the name of Metis (Halfbreeds) or Bois-Brûlés (Charcoal faces). They were chiefly in the employ of the Montreal company, while the servants of the Hudson's Bay Company, largely Orkney-men, were called by their opponents "Les Orcanais." Attacks on the forts were begun by the hostile factions, and in 1816 Gov. Semple and 20 of his officers were killed by the Bois-Brûlés, and Fort Douglas was captured. In the next year Lord Selkirk arrived supported by a band of several hundreds of discharged mercenary soldiers who had fought in the war of 1812-15 in eastern Canada. These his lordship had hired and with their aid Fort Douglas was retaken and the colonists re-established in their farms. About the year 1811 John Jacob Astor of New York engaged a number of men who had been in the North-West Company and with these established Astoria, a trading post, on the Columbia River. This movement took place by way of the Cape Horn route and the rendezvous was in what was known as the Oregon region. The Nor'-Westers taking advantage of the state of war between Great Britain and the United States seized Astoria and employed the greater number of the Astorians in their posts in New Caledonia, as the region of British Columbia was then called. The conflicts of the various companies in different parts of Rupert's Land, the Mackenzie River district, and New Caledonia well-nigh destroyed the fur trade. Now arose a man who was to be the pacificator and leader of all the fur-traders. This was a young Scottish clerk in the Hudson's Bay Company — George Simpson (See SIMPSON, SIR GEORGE.) On the union of the worn-out companies in 1821, Simpson was made chief officer and in time he became "Emperor" of the fur country. For 40 years he built up the united company, and spent a portion of his time at Fort Garry, the chief point in Rupert's Land, as it was also the capital of Assiniboia, as the Selkirk colony was legally called. In Assiniboia a community of 12,000 grew up, 5,000 Metis, 5,000 English-speaking or locally called Scotch halfbreeds, and some 2,000 whites. Not only in this chief settlement, but from Labrador in the Atlantic Ocean to Vancouver Island on the Pacific did the little despot rule. Great forts were scattered over this wide domain, such as Fort Victoria on the Pacific shore, Fort Simpson in the Mackenzie River district, Fort Chipewyan on Lake Athabasca, Fort Edmonton on the Saskatchewan River, old Fort Cumberland on the same river, Norway House on Lake Winnipeg, York Factory, and Fort Churchill on Hudson Bay, Fort William on Lake Superior, Sault Sainte Marie, between Lakes Huron and Superior, the king's posts on the lower Saint Lawrence River, and Rigolette in extreme Labrador. From Lachine, his residence, Sir George Simpson dictated law throughout this vast extent of country, and compelled order and industry. The company quoting its charter-rights was from the first repressive in dealing in its territory with traders other than its own. The usual metaphor for describing Rupert's Land was that it was "surrounded by a Chinese wall." After a revolt of the Metis in 1849 this largely ceased to be the case. The company always retained the confidence of the Indians, and with practically no police or military, maintained a fair state of law and order. The fertile plains of Rupert's Land were visited by several exploratory expeditions shortly after

CANADA — THE WASHINGTON TREATY

the middle of the 19th century. Some of these were that of Palliser and Hector, 1857, of H. Y. Hind in the same year, and of Milton and Cheadle a few years afterward. A famous parliamentary investigation took place in London in the year of Palliser's expedition. Canada was at this time becoming alive to the importance of the Northwest. Negotiations took place between the British and Canadian governments which culminated in 1868-70 in the virtual decision that Rupert's Land, and the Northern and Western territories which were leased to the Hudson's Bay Company, should become Canadian. Unskilful dealing on the part of the Dominion Government with the people of Red River Settlement led, however, to the Riel rebellion, 1869-70. A military expedition of British troops and Canadian volunteers was sent by the old fur traders' route to Red River, but the rebels disappeared before the arrival of the troops. In 1870 the sum of \$1,500,000 was paid by Canada to the Hudson's Bay Company to satisfy its claims, the new province of Manitoba was formed by the Canadian Parliament, and thenceforward the West as far as the Rocky Mountains became a part of Canada. Several years afterward British Columbia came into the Dominion as a province.

The Hudson's Bay Company, though shorn of all political power, still survives, and is vigorous. It still seeks for furs in the far North, and is the largest land company in Canada, owning one twentieth of every new township, which the government surveys. This serves to give the Hudson's Bay Company a strong interest in building up and developing the newer portions of the country. In addition to this the company has largely devoted itself to conducting large shops in the leading business centres of western Canada. The largest of these is the store in Winnipeg. This with its different departments does an enormous trade not only in Winnipeg, but in supplying by the use of the mails the needs of all parts of the country. Important stores are maintained by the company in Portage la Prairie, Rat Portage, Fort William, Calgary, Vancouver, Edmonton, and Prince Albert. The present governor of the Hudson's Bay Company is the predominating figure, Lord Strathcona, the Canadian commissioner in London. As the writer has elsewhere said, "for the last 15 years the veteran of kindly manner, warm heart, and genial disposition, Lord Strathcona and Mount Royal (q.v.), has occupied this high place. The clerk, junior officer, and chief factor of 30 hard years on the inhospitable shores of Hudson Bay and Labrador; the commissioner who, as Donald A. Smith, soothed the Riel rebellion, and for years directed the reorganization of the company's affairs at Fort Garry and the whole Northwest; the daring speculator who took hold, with his friends, of the Minnesota and Manitoba Railway, and with Midas touch turned the enterprise to gold; a projector and a builder of the Canadian Pacific Railway; the patron of art and education, and the patriot who sent out at a cost of between \$1,000,000 and \$2,000,000 the Strathcona regiment of horse to the South African war has worthily filled the office of governor of the Hudson's Bay company, and with much success reorganized its administration and directed its affairs." DISCOVERY; and CANADA — COMMERCE, TARIFFS, AND TRANSPORTATION.

GEORGE BRYCE,
Author of 'History of the Hudson's Bay Company.'

Canada — The Washington Treaty.

The Treaty of Washington, between the United States and Great Britain, was signed on 8 May 1871, and had reference to the Alabama claims (q.v.), the fisheries question, the lake, river and canal navigation, the bonding privilege, and the Vancouver water boundary question. In the years immediately following the Civil War several causes of acute friction existed between the two countries. Of these the principal was the question of indemnity for the depredations committed by the Alabama and other southern cruisers, whose construction in England was claimed by the United States to be a violation of neutrality. The second main cause of contention was the question of the coast fisheries. Under the Reciprocity Treaty of 1854, the fishermen of each nation were admitted to the in-shore coast fisheries of the other. With the expiration of the treaty in 1866 the rights of American fishermen on the Atlantic coast of Canada were limited to the privileges secured under the convention of 1818, with a modification of 1845 admitting them to the Bay of Fundy. By this they were excluded from taking fish within three marine miles of any coasts, bays, creeks, or harbors of British North America, except in special parts of the Newfoundland and Labrador coast, and off the Magdalen islands. The proper interpretation of this three mile limit had been a standing subject of controversy. It was claimed by Great Britain that the terms of the treaty precluded entrance into the bays: by the United States that it merely forbid a nearer approach to the shores of the bay than a distance of three miles. This left in dispute the right to fish in the Bay of Chaleur and other important places. (See Cushing, 'Treaty of Washington,' ch v.) As a temporary expedient since 1866, the Canadian government had sold licenses to American fishermen for a nominal fee. This scheme had proved abortive, for the raising of the license fee in 1868 had resulted in an almost complete cessation in their use, only 25 being taken out in 1869. The Dominion government, in consequence, by an order in council (8 Jan. 1870) abandoned the system of licenses and equipped cruisers to protect its claims in the coast fisheries. The Alabama claims and the fisheries had been for some time a standing subject for negotiations. A treaty of January 1869 (known as the Johnson-Clarendon Treaty) was rejected by the Senate. Negotiations were renewed under President Grant and, at the suggestion of the British government, it was finally decided to appoint a joint high commission to meet at Washington to settle outstanding matters of dispute. The commissioners for the United States were Hamilton Fish, secretary of state; Gen. Robert Schenck, Judge Nelson of the Supreme Court, Ebenezer Hoar, and George H. Williams. The British commissioners were Lord de Grey, Sir Stafford Northcote, Sir Edward Thornton, Professor Montague Barnard, and Sir John Macdonald, prime minister of Canada. Their deliberations lasted from 27 Feb. until 6 May 1871. Of the different points in the treaty agreed upon the most important is that in reference to the Alabama

CANADA — JESUIT ESTATES ACT

claims, on account of its bearing upon international law. The matter at issue here was the extent to which Great Britain had been guilty of a breach of neutrality. The Alabama had been built in Birkenhead. The purpose of her construction had been a matter of general notoriety. The British government had refused to listen to any representations that fell short of being technical evidence. Even when the American consul at Liverpool furnished the needed proof, the dilatory action of the government permitted the cruiser to depart unmolested. The question was whether, in reference to the Alabama and other Confederate cruisers, the government of Great Britain had shown the diligence demanded of a neutral power (see 42d Congress, 2d Sessn. Senate Exec. Doc. 31 November, pp. 146-51). The commission decided that the claims thus arising "shall be referred to a tribunal of arbitration to be composed of five arbitrators," one to be named by the President of the United States, one by Her Britannic Majesty, one by the king of Italy, one by the president of the Swiss Confederation, and one by the emperor of Brazil. The questions considered were to be decided by a majority. Article 6 of the treaty declares: In deciding the matters submitted to the arbitrators they shall be governed by the following three rules, which are agreed upon by the high contracting parties as rules to be taken as applicable to the case, and by such principles of international law not inconsistent therewith as the arbitrators shall determine to have been applicable to the case: A neutral government is bound: First, to use due diligence to prevent the fitting out, arming or equipping, within its jurisdiction, of any vessel which it has reasonable ground to believe is intended to cruise or to carry on war against a power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted, in whole or in part, within such jurisdiction, to warlike use. Secondly, not to permit or suffer either belligerent to make use of its ports or waters as the base of naval operations against the other, or for the purpose of renewal or augmentation of military supplies or arms, or the recruitment of men. Thirdly, to exercise due diligence in its own ports and waters, and, as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties." The tribunal thus arranged met at Geneva (December 1871) and in September 1872, rendered its decision "that the British government had failed to use due diligence in the performance of its neutral obligations," and awarded an indemnity of \$15,500,000 to the United States. In regard to the fisheries, the treaty practically re-established the status under the Reciprocity Treaty of 1854, throwing open the inshore fisheries of the Atlantic coast north of latitude 39° to the fishermen of both nations (Art. XVIII., XIX.). It also established reciprocal free trade in fish and fish oil (Art. XXI.) and decided that commissioners should be appointed to determine what extra compensation, if any, should be paid by the United States for the privileges thus acquired. A compensation of \$5,500,000 was subsequently awarded by the Halifax Fisheries Commission (1878). The location of the north-western boundary (see NORTHWEST BOUNDARY

DISPUTE) which under the treaty of 1846 was declared to follow the 49th parallel "to the middle of the channel which separates the continent from Vancouver's Island and thence southerly through the middle of the said channel and Fuca Straits to the Pacific Ocean," was left (Art. XXXIV.) to the decision of the German emperor. It was further agreed (Art. XXVI.) that the navigation of the river Saint Lawrence shall forever remain free and open for the purpose of commerce to the citizens of the United States. The United States in return declared the Yukon, Porcupine and Stikine open to British commerce, (Art. XXVI.) granting also to British subjects the right of navigating Lake Michigan, the use of the Saint Clair Flats Canal on terms of equality with inhabitants of the United States. The bonding privilege (Art. XXIX.) was mutually conceded. The fisheries provisions were not to go into effect until the "laws required to carry them into operation" should be passed by the British and Canadian Parliaments, the legislature of Prince Edward Island, and the Congress of the United States. The entire treaty was to remain in force for 10 years, after which certain articles—the fisheries arrangement, the right of navigating Lake Michigan, and the bonding privilege—might be terminated on two years' notice from either party. The fisheries clauses of the treaty were subsequently renounced by the United States, and after due notice, expired 1 July 1885. For further details the work of Cushing (mentioned above) may be consulted. The text of the treaty is in 'Treaties and Conventions of the United States' (1889). For the part played by Sir John Macdonald (q.v.) in the negotiations and their relation to Canadian politics, see Pope, 'Memoirs of Sir John A. Macdonald,' Vol. II., ch. xix-xxi. See also UNITED STATES—FOREIGN AFFAIRS, 1861-1904; TREATIES OF THE UNITED STATES WITH FOREIGN NATIONS.

STEPHEN LEACOCK,

Lecturer in Political Science, McGill University.

Canada — Jesuit Estates Act. This measure passed by the legislature of Quebec in 1888, gave rise to an agitation which occupied public attention throughout all parts of Canada during the following year and for a time threatened to bring about a reconstruction of political parties. Under the French régime, which ended in 1763, the Jesuits had owned considerable landed estates at various points in the valley of the Saint Lawrence—particularly at Quebec, Montreal, and Laprairie. After the conquest of Canada by the English the religious orders were permitted to retain the property which they held under grant from the French crown or by other legal title, with the exception of the Jesuits. This order had been banished from France, 1767, and was suppressed generally by the papal brief *Dominus ac Redemptor* (1773). Although Gen. Amherst brought influence to bear upon the government to secure for himself the estates of the Jesuits in Canada, his efforts proved unsuccessful. Despite personal pressure and the papal brief the "black robes" at Montreal and Quebec were not immediately molested by the British authorities, who refrained from taking over their property until the death of Father Casot, the last remaining member of the society. This event occurred in 1800. Once possessed of the Jesuits' estates the Crown had to determine what should

CANADA — GEOGRAPHY

be done with them, and after a certain amount of indecision it was decided that their income should be used for the support of education in the province of Lower Canada. In vain the Roman Catholic bishops maintained the legality of the Church's claim to the property. The government stood its ground and appropriated the revenues.

From having been originally assigned to Lower Canada, the Jesuits' estates passed at Confederation (1867) into the hands of the province of Quebec. It was found, however, by the local government that their actual value was impaired by the ecclesiastical claims which stood against them. The bishops did not cease to protest against their retention by the state and the Jesuit order, revived under papal warrant, defended the justice of its own title. Had these lands been situated in a Protestant community the representations of bishops and Jesuits might have carried little weight, inasmuch as they could not be vindicated by an appeal to the courts, but where the mass of the population was Catholic the reiterated claims of the Church had their effect upon the market. After Confederation the rent of the property decreased until it became almost negligible in comparison with the valuation, and when the government sought to effect a sale no purchaser could be found. In 1887, after the question had been put off by several preceding administrations, Mr. Mercier, a French Nationalist of pronounced views, endeavored to effect a final settlement of it. Whatever the motives which actuated him, to criticize them would be to raise a matter of opinion. He introduced a bill which gave \$400,000 to the Roman Catholic Church as compensation for the property which the Crown had seized in 1800. This sum was, for the moment, to constitute a special deposit which eventually should be distributed by the Pope in return for a relinquishment of all claims to the Jesuits' estates that had been advanced by the bishops or by the Jesuits themselves. As a matter of fact the Pope divided the money between the Jesuits, the bishops, and Laval University, but in the meantime this recognition of his right to allot what were considered public funds among members of his own Church, drew forth cries of remonstrance from a large number of Protestants. A simultaneous grant of \$60,000 to Protestant schools in Quebec did not allay the feeling of hostility.

It should be observed that two distinct questions were raised by the agitation which proceeded from the Jesuits' Estates Act. The first had its root in the opposition of religious systems; the second was due to the federal character of the Canadian constitution. In 1888, Col. O'Brien, a Protestant member of the House of Commons, proposed that the Dominion Parliament should disallow the action of the Quebec Legislature in appealing to the Pope and setting aside \$400,000 as a subsidy to Roman Catholic institutions. The debate which followed was marked by a series of able and aggressive speeches from all quarters of the House. The chief supporter of Col. O'Brien's motion was Mr. Dalton McCarthy, while against him were ranged the premier, Sir John Macdonald, and Mr. Laurier, the leader of the Opposition. On the one side an appeal was made to the alleged political misdeeds of the Jesuits throughout the whole course of their history and to

their expulsion from the chief countries of the civilized world. On the other, it was maintained that the Dominion Parliament could not, without extreme danger, disallow provincial legislation and that "the subject-matter of this act was one of provincial concern, only having relation to a fiscal matter entirely within the control of the legislature of Quebec." The vote of 188 to 13 against Col. O'Brien's motion conveys but a faint idea of the public interest in this debate and in the issues which lay behind it. The fundamental claim of the extreme Protestant party was that recognition of papal authority and the encouragement of the Jesuits were direct blows at British freedom; while the leaders of both parties united to point out the constitutional dangers which would accompany disallowance.

Outside the House of Commons the agitation caused by the Jesuits' Estates Act led to the formation an "Equal Rights" party, which was recruited from the ranks of the more pronounced Protestants. It proved impossible, however, to break down existing political lines by giving central importance to an anti-Catholic movement. Despite many public meetings and an active campaign in the newspapers, the attack upon the Jesuits' Estates Act has left no lasting trace upon party organization in Canada.

CHARLES W. COLBY,

Professor of History, McGill University

Canada — Geography. I. GENERAL.—*Area and Boundaries.*—With the exception of Alaska, Greenland, Newfoundland, and the two small islands of Saint Pierre and Miquelon, all the northern half of the North American continent is comprised in the Dominion of Canada. Alaska, the great peninsular projection at the northwest corner of the continent, with a narrow strip of coast depending from it southward, belongs to the United States; Greenland, a huge island at the northeast corner, is Danish; Newfoundland, another island blocking the mouth of the Saint Lawrence estuary on the east coast, is British, and Saint Pierre and Miquelon, lying off Newfoundland, are French. To the north of the continent there is a cluster of large islands, divided from the mainland and from one another by comparatively narrow channels. All of these form part of Canada and are included in its area, but as yet they have been only partially explored, and their exact dimensions are not known. The official estimate, as nearly accurate as it can be made at present, gives the total area of Canada, including the great fresh-water lakes wholly within its boundaries, as 3,745,574 square miles. The boundaries separating Canada from its only continental neighbor, the United States, are to a great extent meridians of longitude or parallels of latitude. Between Canada and Alaska, beginning from the north, the boundary follows lon. 141° W. from the Arctic Ocean to Mount Saint Elias, within 20 miles of the Pacific, from which point it is an irregular line running about parallel with the coast round the heads of all bays and inlets of the sea at a distance of 20 to 30 miles inland. It reaches tide-water again at the head of Portland Channel, down which it passes, terminating in the Pacific Ocean. All the islands of the coast south of lat. 54° 40' belong to Canada as far as the southern extremity of Vancouver Island,

CANADA — GEOGRAPHY

The international boundary begins again in Juan de Fuca Strait. It takes a devious course from Vancouver Island to lat. 49° on the coast of the continent, and then follows the 49th parallel as far east as Lake of the Woods. A water boundary here begins, up Rainy River and its head-water series of lakes, cutting across the height of land to another chain of small lakes and following Pigeon River to its mouth in Lake Superior. From this point the boundary is the chain of Great Lakes and the Saint Lawrence River to its intersection with lat. 45°. The line now follows a more or less arbitrary course along the 45th parallel for some distance, then rising irregularly to the north almost to lat. 47° 30', then down the upper course of the Saint John River, then due south to the head-waters of the Saint Croix River, which it follows to its final termination in the Bay of Fundy.

The areas of the individual provinces and territories are as follows:

	Land	Water	Total
Nova Scotia	21,068	360	21,428
New Brunswick	27,911	74	27,985
Prince Edward Island .	2,184	2,184
Quebec	341,756	10,117	351,873
Ontario	220,508	40,354	260,862
Manitoba	64,327	9,495	73,822
British Columbia . . .	370,191	2,439	372,630
Assiniboua	88,270	600	88,870
Saskatchewan	103,846	3,772	107,618
Alberta	101,521	362	101,883
Ungava	349,109	5,852	354,961
Keewatin	456,997	13,419	470,416
Athabasca	243,160	8,805	251,965
Mackenzie	532,034	29,548	561,582
Yukon	196,327	649	196,976
Franklin (estimated)	500,000	500,000
Total	3,619,818	125,756	3,745,574

Main Physical Features.—The four principal surface divisions are: (1) The Appalachian region, forming the extreme southeastern corner; (2) the Laurentian plateau or peneplain, with its fringes and outliers of lowlands, comprising the remainder of the eastern half of Canada; (3) the central plain; and (4) the mountain region to the west. Each of these divisions represents, on the whole, a different geological formation and has its own peculiar physical features. I. The Appalachian region of Canada is the northern extremity of the system of parallel ranges of mountains pushed up, as it were, from the southeast against the great archæan, or Laurentian, area. The ranges all run from southwest to northeast, the Nova Scotian peninsula being without a corresponding extension in the United States. The hills are composed of older rocks, rising out of the carboniferous strata which once overlay the whole district, but of later formation than the Laurentian plateau to the north. They are much weathered and the river valleys have been comparatively well eroded. II. The Laurentian plateau or peneplain which covers about half the entire area of Canada is, geologically speaking, the nucleus of the continent. It presents a shield-shaped surface of archæan rocks, broken into on the north by Hudson Bay, and extending south to the Saint Lawrence River. As is implied by calling it a peneplain, it is a much-weathered surface, nowhere rising to any great height, but maintaining a fair elevation

above the sea-level, except along the west shore of Hudson Bay. It is a country of hard, crystalline rocks, everywhere scored by glacier action, and sparsely covered with soil in which pine, spruce, and other northern trees grow more or less densely, giving place in the higher latitude to mosses and lichens. As a result of the melting of the glaciers which covered this region in the last geological period, the whole surface is a net-work of small lakes and streams. The latter have been unable to wear down the hard rocks to any appreciable extent, and consequently present all diversities of level with many falls and rapids in their course. The western limit of the plateau is marked by a series of great lakes, from Great Bear Lake in the north to Lake Huron near the southern extremity. Adjoining the Laurentian plateau on the north and south there is, as it were, a fringe of later geological formations. Most of the large islands north of Hudson Bay and of the mainland west of it appear to consist chiefly of older sedimentary rocks in undisturbed arrangement, but the partial glaciation of these islands has hitherto prevented any detailed geological or other survey. South of the Laurentian plateau again occurs a lowland area, consisting of the valley of the Saint Lawrence River and the peninsula enclosed by the three lower members of the chain of great lakes. It is small in extent, but of great importance in the history of Canada, because the first European settlements were established mainly within its limits and it still contains the greater part of the population. III. The central plain is of vast extent, reaching from the Arctic Ocean to the Gulf of Mexico, so that only its northern portion lies in Canada. It is the elevated bed of a carboniferous sea, and from a breadth of 800 miles at the international boundary it is gradually narrowed toward the north by the westerly trend of the Laurentian plateau and broken into by subsidiary ranges of the Rocky Mountains. Still farther north, where it terminates at the Arctic Ocean, it again expands to a width of about 300 miles. There are three steppes of different elevations in this great plain, rising from east to west, and the general slope is from the southwest downward to the east and north. IV. The fourth great region, the mountain belt, is also of vast extent, being traceable in greater or lesser width from the Tierra del Fuego, at the extremity of South America, to the farthest western point of Alaska. In Canada this mountain, or Cordilleran, region attains a breadth of about 400 miles, the greatest average elevation being in the southern portion. The Rocky Mountains, the most easterly range, are paralleled by a succession of smaller ranges, the most westerly of which is represented by the mountains of Vancouver Island and the Queen Charlotte Islands. The geological age of this division is more ancient than that of the central plain, and the changes in the crust have been violent and recent, resulting in the upheaval of the Rocky Mountains, the youngest of the ranges of the Cordilleran System.

Altitudes and Slopes.—The greatest altitudes in Canada are in the Saint Elias range of mountains, a small group near the Alaska frontier, not far from the Pacific Ocean. Mount Logan is the highest of these and is estimated at 19,539 feet. The next greatest elevations are

CANADA — GEOGRAPHY

in the southern portion of the Rocky Mountains and the parallel ranges immediately to the west, where several peaks exceed 13,000 feet, although only one, Mount Columbia, possibly reaches 14,000. The height of the ranges west of the Rocky Mountains becomes less and less as they approach the Pacific Ocean, and in Vancouver Island the highest peak is under 7,500 feet. The next greatest altitudes are in the extreme east of the Laurentian plateau, in northern Labrador, where a range of hills occurs, bordering on the Atlantic Ocean, which attains a height of 6,000 feet. Elsewhere in Labrador the Laurentian plateau seldom exceeds 1,800 feet, and on the west side of Hudson Bay the Laurentian area is lower and gradually merges in the central plain. The Appalachian region contains ranges of low hills nowhere exceeding 4,000 feet, which is only reached in the extremity of the Gaspé peninsula. The central plain rises in three steppes from the valley of the Red River, about 800 feet above sea-level, to the foothills of the Rocky Mountains, where it has an extreme elevation of 4,200 feet and an average elevation of about 3,000 feet. The Saint Lawrence lowlands are nowhere much higher than 1,000 feet, or about 500 feet above Lakes Huron and Erie, and sink gradually with the Saint Lawrence River to its mouth.

Water Ways.—The distribution of land and water in Canada has rendered the interior continental area peculiarly accessible. The Gulf of Saint Lawrence is a large arm of the sea affording ready means of entrance from the east, and leads to the broad estuary of the Saint Lawrence River. Exploration naturally followed this highway. No mountain barriers occur to obstruct or divert approach by the rivers Saint Lawrence and Ottawa to the chain of great lakes that extend to the very centre of the continent. The length of continuous waterway from the Atlantic Ocean at the Straits of Belle-Isle to the head of Lake Superior is 2,388 miles. Similarly Hudson Bay, a huge landlocked sea, communicating with the Atlantic by Hudson Strait, reaches even farther west than Lake Superior to the south of it. It was by way of Hudson Strait and Hudson Bay that the English explorers arrived at the great interior plains, just as the French *voyageurs* penetrated to the same region by the Saint Lawrence and the Great Lakes. The first systematic attempt at settlement of what is now the province of Manitoba, where the prairies begin, was by way of Hudson Bay, when Lord Selkirk established his colony of Highlanders at the junction of the Assiniboine and Red rivers in the first years of the 19th century. Two great waterways are found in the central area leading up from Hudson Bay and from the Arctic Ocean to the very base of the Rocky Mountains. These are the Nelson-Saskatchewan and the Mackenzie-Athabasca river systems, both of which were well-traveled highways for *voyageurs* and fur-traders long before settlements along the Saint Lawrence Valley had reached the Ontario peninsula. In the Appalachian region there is one river of considerable length, the Saint John, which flows across the ranges into the Bay of Fundy. The mountain region possesses its great rivers in the Columbia, the Fraser, and the Yukon, all of which originate at the western base of the Rocky Mountains and empty into the

Pacific. But the rivers of this region are obstructed by numerous and fierce rapids and have not afforded the same facilities for navigation as the rivers of the central and eastern areas. In recent years, however, the Yukon has become a great highway leading to the gold-fields of Alaska and the Yukon Territory.

Climate and Vegetable Productions.—The climate of Canada has the usual characteristics of a continental climate in its extremes of heat and cold, but the presence of vast bodies of water, Hudson Bay and the Great Lakes, in the very heart of the continent, has introduced modifications of temperature which differentiate Canada from other great continental areas. Thus, the Laurentian lowlands enjoy a temperate and fairly equable climate, and are wholly free from periods of drought. The central prairies, moreover, though subject to extremes of temperature, obtain sufficient moisture for growing wheat, except in the extreme southwest portion. Here an area of about 20,000 square miles forms part of the semi-arid region which has so great an extension south of the international boundary. The grassy plains are liable to frosts in the early and late summer, perhaps in consequence of the general slope down toward the Arctic Ocean, with no intervening chain of mountains. It has been found, however, that where the ground has been broken up for agriculture over considerable areas these unseasonable frosts do not occur, and at the same time there is a marked tendency to an increase in the average precipitation. The western portion of the central plain enjoys milder winters than the eastern, and this contrast is even more marked in the north than in the south of the area. In the mountain region great variations are presented both in temperature and humidity. The islands and the coast of the mainland up to the crest of the first range of mountains upon it have a very mild and very moist climate. The western slopes of the ranges farther inland also receive abundant rainfall and are clothed with dense forests. But the interior plateau receives very little moisture, and its altitude and dryness combine to give it extremes of temperature in summer and winter. The northern part of the Laurentian plateau on either side of Hudson Bay is, for climatic reasons, uninhabitable. The forests that clothe the southern portion of the same plateau give place to grasses, sedges, and mosses, and ice remains in the rivers and lakes throughout the brief summer. This tundra region, some of which has not yet been explored, covers an area of perhaps 200,000 square miles west of Hudson Bay, where it goes under the name of "the Barren Grounds," and half as much east of Hudson Bay, in the Labrador peninsula. The climate of the Appalachian region is influenced by its proximity to the Atlantic Ocean, and presents no peculiarities. There are three well-defined belts of vegetation in eastern and central Canada. The southern part of the central plain is a region of treeless, grassy prairies, once the home of countless buffalo. In the extreme north, on either side of Hudson Bay, are the Arctic tundras, the Barren Grounds, where only mosses and other lower forms of vegetable life can exist, affording food to enormous herds of caribou and a smaller number of musk-oxen. Between these two treeless regions is the great forest belt

CANADA — GEOGRAPHY

which covers the whole of eastern Canada and extends across the central plain to the mountains, verging continually north in consequence of the decreasing severity of the winters, until in the valley of the Mackenzie River it reaches beyond the Arctic circle. In the northerly latitudes the forest is composed chiefly of pine, spruce, tamarack, and aspen poplar, but in its southern extension, and especially in the Saint Lawrence lowlands and the Appalachian region, deciduous trees, such as the maple, beech, and ash, are mingled with the conifers and even replace them in the river valleys. Before the advent of the white men, a dense growth of forest covered the Appalachian region and the Laurentian lowlands, which have since been cleared to a great extent and agriculture introduced. The process is still going on, settlement is pushed farther and farther north, and forest is giving place to farms wherever the soil is suitable. The prairie region is being rapidly converted to agricultural uses, even the semi-arid corner being capable of cultivation by the aid of irrigation. The mountain region, throughout almost its entire extent, is heavily wooded near the coast and on the western slopes of the inland ranges. The enormous height and girth to which trees of some species, such as the Douglas fir and western cedar, may attain are well known. The river valleys and alluvial flats of the southern portion are suitable for agriculture, but the interior plateau does not receive enough moisture and is given over to ranching.

II. THE PROVINCES.—[For the sake of convenience and completeness, the physical features and topography of the provinces comprising the Dominion are here briefly treated. The articles in this work on the individual provinces should be consulted for further information.]

Nova Scotia.—The province of Nova Scotia, the most southerly member of the Appalachian region in Canada, consists of a peninsula about 250 miles long and 100 at its greatest breadth, and its continuation, the island of Cape Breton, which is separated from Nova Scotia proper by a narrow strait, the Gut of Canso. More or less parallel to the length of the peninsula run ranges of low hills, which near the Atlantic become mere ridges of rock. The country on this, the southern side of the province, is wild and rocky, covered with forests and dotted with small lakes. Agriculture is confined to the alluvial land along the river valleys, and the villages and towns for the most part are situated on the coast at the heads of the numerous bays which here indent it. The north shore of the peninsula is of a totally different aspect. The extended ridge of trap which forms the southern shore of the Bay of Fundy is broken into in a few places only, and long narrow bays are thus formed, into which the tide rushes with great force. The chief agricultural district of the province is behind this protecting wall of trap, and the hills beyond are covered with fertile soil and clothed to their tops with dense hardwood forests. The marshes formed by the enormous tides of Minas Basin and Chignecto Bay, the two heads of the Bay of Fundy, have been reclaimed and diked, and form a rich pasture country. The orchards of the sheltered valleys on this side of the peninsula are celebrated. The chief region of mining and industrial development is the northeast por-

tion, facing Northumberland Strait and the Gulf of Saint Lawrence. Here coal and iron are extensively worked; gypsum also occurs in large quantities and is exported principally from the district around Minas Basin. Gold, on the other hand, is found in the wild rocky region along the southern or Atlantic coast, and is mined on this side from one end of the peninsula to the other. The fisheries of Nova Scotia have always been an important industry, carried on from every harbor of the province. Cape Breton Island, of irregular shape, about 100 miles long by 80 broad, forms part of the province of Nova Scotia. An arm of the sea, entering from the northeast, almost divides the island in two; actual division is accomplished by a canal across the narrow neck of land. A great part of the island to the north is a high forest-covered table-land, and the centre about the Bras d'Or channel is the most picturesque district in the province. At the east side occur the coal and iron ore deposits which are making Sydney, its chief town, one of the industrial centres of Canada.

New Brunswick.—The second in importance of the maritime provinces is New Brunswick, occupying the centre of the Appalachian region of Canada. It forms an irregular square of about 200 miles in extreme length and breadth, bounded on the north by the Bay of Chaleurs and the province of Quebec, on the east by the Gulf of Saint Lawrence and Northumberland Strait, on the south by Nova Scotia (at the isthmus) and the Bay of Fundy, and on the west by the State of Maine and the province of Quebec. Two lines of hills traverse the province; one follows the coast-line of the Bay of Fundy, the other, starting from the same southwestern angle, runs diagonally across the province to the northeast. Between the two lies a triangular low-lying plain, sloping down to the east coast, and beyond the diagonal range of hills the northwest region of the province is a rolling country, fertile and well suited for agriculture, but at present covered with forests. New Brunswick is a country of fine rivers, which have cut broad valleys through the soft rocks of the interior and afford access from the sea-coast to the innermost recesses of the province. The Saint John River flows south from the extreme northwest angle, entering the Bay of Fundy not much more than 50 miles from the international boundary. The Saint Croix, forming the boundary, also falls into the Bay of Fundy. The Restigouche, flowing into the Bay of Chaleurs, the Miramichi into Miramichi Bay in the Gulf of Saint Lawrence, and the Richibucto, into Northumberland Strait, are the other large rivers. A dense forest, chiefly spruce, still covers most of the province, and lumbering is the principal industry. The fisheries are second in importance. Agriculture follows the river valleys mainly, but the marsh lands at the head of the Bay of Fundy have been converted into rich pastures, and new land in the interior is continually being brought under cultivation. In time, no doubt, the whole of the level area in the centre of the province will be devoted to agriculture, when the forest wealth has been exhausted in that region. The mineral resources of New Brunswick have not yet been developed to any extent.

Prince Edward Island.—Prince Edward Island, the smallest province of the Dominion,

CANADA — GEOGRAPHY

is an island in the Gulf of Saint Lawrence, 145 miles long, with an extreme breadth of about 30 miles, separated from New Brunswick and Nova Scotia by Northumberland Strait, which varies from 9 to 30 miles in width. The curving coast on the north side of the island is broken by a deep bay with a narrow entrance, and terminates in long, narrow points. The south coast is very irregular, presenting a succession of bays and inlets. The island has a uniform, gently undulating surface, everywhere fertile, and for the most part cleared of woods and brought under cultivation.

Quebec.—The oldest province, Quebec, formerly a French colony, is still largely inhabited by French-speaking people, although in the extreme south a group of counties, commonly known as the Eastern Townships, were settled almost exclusively by English-speaking colonists. The province of Quebec is one of the largest in Canada. It extends north and east into Labrador, bounded in the latter direction by the strip along the Atlantic coast which belongs to Newfoundland. Its extreme northwest corner touches James Bay, from which its western boundary runs due south to the Ottawa River. The southern boundary is irregular, consisting of the Ottawa River nearly to its mouth, then the 45th parallel of latitude, and the rest of the international boundary eastward as far as New Brunswick, and finally the Restigouche River and the Bay of Chaleurs separating it from that province. The island of Anticosti and the Magdalen group in the Gulf of Saint Lawrence belong to Quebec. The whole of the valley of the Saint Lawrence River, from a short distance above Montreal, lies within its boundaries and constitutes, with the Eastern townships, the chief agricultural district. The valleys of the principal affluents of the Saint Lawrence are also cultivated, and two new agricultural districts, that watered by the upper Ottawa and the country about Lake Saint John, out of which flows the Saguenay River, are receiving a great influx of settlers. Except for the area in the extreme northwest of the province, which drains into James Bay, all the rivers empty into the Saint Lawrence River or Gulf. From the north come the Ottawa, the Saint Maurice, the Saguenay, and many others of less note farther east, while from the south the only ones of importance are the Richelieu, flowing from Lake Champlain, and the Saint Charles, emptying nearly opposite the city of Quebec. The general slope of the country is thus apparent. The southern edge of the Laurentian plateau, which runs not far from the Ottawa and Saint Lawrence rivers, comes quite down to the coast of the Gulf. South of the Saint Lawrence River the fertile lowlands are bounded by the ranges of the Appalachian system, which approach ever nearer to the river until, in the Gaspé peninsula, they also reach the water's edge. Next to agriculture the chief industry of the province is lumbering. The immense extent of the forests on the Laurentian plateau provides a source of supply that is virtually inexhaustible, and the recent development of the manufacture of pulp-wood has given new value to the smaller and softer trees such as the spruce. The mineral wealth of Quebec is not so great as that of Nova Scotia, but it is considerable, nevertheless. Asbestos of the best quality is found in the southeastern part of the province,

and virtually constitutes the world's sole supply of the mineral. Mica is also extensively mined, and gold, copper, and iron to a lesser extent.

Ontario.—The province adjoining Quebec on the west, Ontario, is the most populous and wealthy of Canada. It extends from the province of Quebec to Lake of the Woods; its northern boundary is the Albany River, which flows from west to east into James Bay, and its southern limit is the international boundary from Lake of the Woods to Lake Superior and the chain of Great Lakes and the upper Saint Lawrence. The whole of the province is thus to the north of the great waterway, but as both the lakes and the river in its upper course lie at the very southern limit of the area which they drain, Ontario contains all the tributary rivers of the Saint Lawrence system as far down as the Ottawa River. These, however, are not as numerous as might be expected, for the height of land between the Hudson Bay and Lake Superior slopes runs very near to the lake. Almost all the northern part of the province, therefore, drains into James Bay by the Albany and Moose rivers and their tributaries. The Nipigon, issuing from Lake Nipigon, flows south, exceptionally, into Lake Superior. In the extreme west a corner of the province belongs to the Lake Winnipeg drainage area. There are no ranges of mountains in Ontario. The Laurentian plateau includes the northern half of the province, while the rest is part of the Saint Lawrence lowlands. The lowlands, and especially their western extremity, the peninsula between Lakes Huron, Erie, and Ontario, are the chief agricultural district. The peninsula is favored with an excellent climate and soil, and its southern portion is the principal fruit-growing district in Canada, the chief products being peaches, grapes, strawberries, and apples. Hops, tobacco, and flax are also cultivated successfully in this part of Ontario. The northern part of the province beyond Lakes Huron and Superior has recently begun to be opened up, and its agricultural possibilities are being developed with great rapidity. Lumbering has always been an important industry, but the available timber limits producing pine have begun to show signs of exhaustion. The increasing demand for wood-pulp has however given new value to the great northern belt of forest, which is mainly spruce and practically inexhaustible. Ottawa is the chief centre of the manufacture of lumber; its situation on the Ottawa, the great log-carrier of two provinces, and the magnificent water-power of the Chaudière Falls, utilized for operating the saw-mills, give it advantages over all competitors. The mineral resources of Ontario have begun to be turned into account. Gold is found in various places, chiefly in the Lake of the Woods or Rainy River district. Iron is found in many different localities but the ore is principally mined in the Algoma district, northeast of Lake Superior. The water-power of the rapids in the Saint Mary River connecting Lakes Superior and Huron has been utilized, and great iron and steel manufactures have been established at the town of Sault Ste. Marie. The Sudbury district north of Lake Huron is rich in copper and nickel, the latter metal being found in quantity only there and in New Caledonia in the Southern Pacific Ocean. In the western part of the Ontario peninsula petroleum wells have long been worked.

CANADA — GEOGRAPHY

Manitoba.—The next province westward is Manitoba, a square of 270 miles to a side. It has Ontario and Keewatin to the east, Keewatin and Saskatchewan to the north, Saskatchewan and Assiniboia to the west and the international boundary on the south. The southern part of the province is at present the chief wheat-growing district of Canada. It consists of a perfectly level plain, the alluvial bed of a former lake, through which winds the Red River. This first prairie steppe is bounded on the east by the Laurentian plateau which covers all the eastern part of Manitoba beyond Lake Winnipeg. Westward, an escarpment, nowhere rising higher than 500 feet above the level of the first steppe, runs in a northwesterly direction and marks the beginning of the second prairie steppe, which presents a more undulating surface. More than two thirds of Manitoba is thus prairie land, for the northern belt of forest only covers a small corner of the province. The area covered by water is considerable. Lake Winnipeg, a very large lake, is mainly within the boundaries of Manitoba, as are also Lake Manitoba and Lake Winnipegosis, with others of smaller size. The chief river of the province is the Red River which enters Manitoba from the south and empties into Lake Winnipeg. As far north as the city of Winnipeg it is navigable and was in former days the only means of communication between the prairie settlement and the rest of the world. At Winnipeg the Red River is joined from the west by the Assiniboine, which with its affluents waters all the western part of the province. The Winnipeg River which discharges the waters of Lake of the Woods into Lake Winnipeg, flows across the Laurentian plateau and therefore, from its swift current and many rapids, it is useless as a means of communication.

Northwest Territories.—The Territories of Assiniboia, Saskatchewan, and Alberta, which form a belt 430 miles wide extending from Manitoba and Keewatin to the Rocky Mountains, constitute an administrative unit like one of the provinces and are conveniently treated together. With the exception of the northeastern corner of Saskatchewan which trenches upon the Laurentian plateau, the whole area of these territories is part of the great central plain. All of Assiniboia and the southern half of Alberta, with a considerable part of Saskatchewan, are treeless; the northern part of the latter two is within the forest belt. The second prairie steppe, which begins in Manitoba, extends over about half of Assiniboia. It is bounded there by another escarpment running northwest, which is the edge of the third prairie steppe. From an elevation of about 2,000 feet above the sea, this third division of the prairie rises gradually to its highest level, 4,200 feet, at the base of the mountains. It is much more irregular in its surface than the second steppe, and certain portions of it, forming small isolated plateaus, stand as much as 2,000 feet above the surrounding country. The Saskatchewan river, in its two branches, the North and the South Saskatchewan, flows through the entire length of the Territories from west to east, and empties into the northern part of Lake Winnipeg. The south branch passes through the western part of Assiniboia, and then turns north into Saskatchewan. The eastern part of Assiniboia is watered by the upper course of the Assiniboine and some

of its tributaries. Across Alberta flow the upper waters of both branches of the Saskatchewan, and also in the northern part the Athabasca and other streams belonging to the MacKenzie River basin take their rise. Manitoba and the Northwest Territories together contain the greatest continuous expanse of agricultural land in Canada, and the larger half of it is in the Territories. The whole of eastern Assiniboia and the southern part of Saskatchewan consists of the fertile prairie. Western Assiniboia and southern Alberta constitute a semi-arid district, not suited for agriculture except by the aid of irrigation, but are excellent pasture land. Most of Saskatchewan, with the northern part of Alberta, is wooded country, broken by prairie openings, with abundant streams and small lakes. It is well adapted for mixed farming and stock-raising. Alberta is pre-eminently a ranching country. From the proximity of the Rocky Mountains the rainfall is small but the winters are mild with very little snow. Irrigation is now being introduced to promote agricultural settlement. Besides agricultural possibilities the Territories have a valuable asset in their extensive coal fields. Coal is mined for local use in southern Assiniboia, where seams are exposed in many of the valleys. It also crops out frequently in North Saskatchewan, and in Alberta the coal-measures which are known to underlie the whole surface yield abundant supplies of fuel, varying in quality from lignite to anthracite. This great source of wealth has as yet been scarcely touched.

British Columbia.—The largest of the provinces is British Columbia, occupying the whole of the mountain region from the international boundary to lat. 60°. It also cuts off a portion of the central plain, where the eastern boundary of the province leaves the Rocky Mountains and runs north along long. 120°. Vancouver Island and the other islands off the mainland are included in the bounds of the province. West of the broad chain of the Rocky Mountains, which form the eastern boundary, three older ranges run approximately north and south and are thus confined to the southern part of the province, being extinguished northward by the more recent upheaval of the Rockies, whose axis inclines to northwest. These smaller and lower ranges are, in order from east to west, the Purcell, the Selkirk, and the Gold ranges. Near and parallel to the Pacific coast another broad mountain system, the Coast Range, extends northward into Yukon Territory and Alaska, where it reaches its greatest elevation. Between the Coast and Gold ranges there is the interior plateau, about 100 miles in breadth and from 2,000 to 3,000 feet in elevation. To the north it is cut off by transverse ranges of mountains. Vancouver Island and the Queen Charlotte islands are the unsubmerged remains of a subsidiary mountain range west of the Coast Range. The rivers and lakes of British Columbia occur in deep valleys between the ranges. The Columbia River and its chief affluent, the Kootenay, take a remarkable course through the valleys between all the eastern ranges, running north and south in great loops. The lake-like expansions of both rivers form the chief navigable inland waters of British Columbia. The Fraser River which rises in the Rocky Mountains flows at first north, but soon turns westward round the head of the Gold Range, and finally runs almost due south cutting

CANADA — AGRICULTURE

a deep channel in the interior plateau. It breaks through the Coast Range and reaches the sea not far from the international boundary. Its chief affluent is the Thompson. Both are very turbulent streams and form an additional obstacle rather than an assistance to inland communication. The northern half of the province is still very imperfectly explored. In a central elevated plateau many rivers take their rise, some flowing south to join the Fraser, others, such as the Liard, east into the Mackenzie basin, others again like the Skeena and Stikine westward into the Pacific Ocean. What British Columbia lacks in a system of navigable inland waterways is more than made up by its deeply indented coastline, where many magnificent harbors for sea-going vessels of any draught are available, from Port Simpson at the north to Burrard Inlet at the south extremity. The coast of Vancouver Island is also well supplied with harbors. British Columbia, although so mountainous, is not without its agricultural industries. The interior plateau forms a good ranching country, and in the sheltered valleys, where irrigation can be introduced, fruit farms are very successful. Lumbering is one of the great industries of the province, and the mineral wealth is very great. Gold has been found in many localities from the international boundary to Atlin district on the borders of Yukon Territory. Placer mining alone has been carried on in most of these places, but in the Kootenay district in the extreme south, where communication by railway and water is easy, scientific treatment of ores has been practised for some years. The metals, besides gold, produced by this method are silver, lead, and copper. The exceedingly heavy growth of timber has added to the difficulty of making roads and even of prospecting. Iron ore has been found both on the mainland and on Vancouver Island, but is mined principally on Texada Island in the Strait of Georgia. Coal is obtained chiefly on Vancouver Island at Nanaimo and Comox and in the Rocky Mountains at Crow's Nest Pass. Another great industry of British Columbia is the salmon-fishery, which is carried on chiefly at the mouth and in the lower reaches of the Fraser River. Canneries are also established at the mouths of the Naas, Skeena, and other rivers.

Unorganized Territories.—The population of Canada is almost entirely contained in the provinces which lie along the southern boundary. The vast extent of habitable and also uninhabitable country to the north of these is divided into territories, which (except the Yukon Territory) are directly administered by the government at Ottawa. Their respective positions in relation to each other and to the provinces south of them have already been given. Of the six territories, which together make up nearly two thirds of the total area of Canada, the most promising for settlement or industrial development are the three furthest west, Athabasca, Mackenzie and Yukon. The Mackenzie River Valley, contained within the limits of the two former, is fertile and covered with trees almost to its very mouth in the Arctic Ocean. The climate is not so severe as the high latitudes would seem to imply; the summers, though short, are hot and the summer days long, and vegetables and some cereals have been raised by Hudson's Bay Company's agents at most of their posts in the district. Coal moreover occurs and

possibly petroleum. The fur trade, which is still a considerable industry, is carried on over the whole area covered by the sub-Arctic forest, and Athabasca and Mackenzie will remain the home of many species of fur-bearing animals as long as that forest remains to shelter them. Yukon as a mineral country is famous through the discoveries of gold in the Klondike Valley. As in British Columbia, the southern portion of the same mountain district, the ranges are highly metalliferous, and doubtless in course of time copper and other metals will be mined as well as gold. The mountains are much lower than in British Columbia and are far less formidable obstacles to exploration and communications. The Yukon River flows through the Territory from south to north and is navigable for most of its course. Timber grows in the valleys and on the lower hills.

The southern portions of Keewatin and Ungava may yet attain importance in the development of Canada on account of the many waterfalls and rapids which occur on their rivers within easy reach of Hudson Bay. The opportunities these afford for cheap development of electrical energy may yet be turned to account for manufacturing purposes, especially if it is found practicable to make exports by way of Hudson Bay. But the northern portions of both Keewatin and Ungava, as well as the east part of Mackenzie, must remain a hunting country only. They are barren and rocky and their streams, lakes and harbors are ice-bound for most of the year. The crystalline rocks of the Laurentian plateau contain no valuable ores or minerals. A scanty population of Indians and half-breeds will continue to subsist by hunting and trapping, and to sportsmen the pursuit of Barren Ground caribou and musk-oxen will always prove attractive. The former at least are in no danger of extinction. Vast herds of them are seen by every explorer and hunter that penetrates this country. Franklin, the last of the northern territories, has at present only a sentimental value. The series of daring British explorers who, in their search for a northwest passage, discovered the various islands and claimed them for British territory, are commemorated in the names given to the islands themselves and to the principal bays, straits and headlands, and the whole has been named after the most distinguished of them all, who met his death on Canadian soil while still pursuing the search. As most of these islands lie outside the area of Laurentian formation, it is possible that they may contain mineral wealth, but whether climatic conditions will permit of commercial exploitation of such wealth is questionable. For ordinary purposes and for men of the white race they are utterly uninhabitable.

H. H. LANGTON,

Editorial Staff, 'Review of Historical Publications Relating to Canada.'

Canada — Agriculture. Fish and furs were the earliest products of Canada. Agriculture, however, in time became the chief industry of the people, and to-day far outweighs the other three great natural products, furs, fish, and minerals. Canada possesses a unique record of national growth in the various census enumerations that cover nearly two and a half centuries. The earliest is that for 1665. Students of statistics will find the successive records from 1665 to 1871

CANADA — AGRICULTURE

in Vol. 4 of the Census of Canada for 1871. The following table has been compiled from the last three census takings, and, while valuable for reference as to the main items in the agricultural industry, it is also a statistical statement of 20 years' growth.

DOMINION OF CANADA — CENSUS STATISTICS OF AGRICULTURE.

ITEMS	1881	1891	1901
Acres occupied.....	45,358,141	60,287,730	63,422,301
Acres improved.....	21,899,181	28,537,242	30,163,496

Cheese, pounds.....	63,901,152	114,981,514	220,833,269

Having given the above totals for Canada as a whole, it may now be interesting to give details by provinces. The following tables compiled from the same sources as the preceding will enable the reader to compare the various provinces. The following conclusions may be drawn; farms west of Lake Superior are more than twice as large as those east of the lake; from eighty to ninety per cent of the farms of Canada are owned by the occupiers; Ontario possesses nearly one half of the farm wealth of Canada; while mixed farming is followed in Ontario, the live stock industry is paramount and far exceeds that of all the other provinces combined; Manitoba has become the chief wheat-producing province of the Dominion.

The agricultural growth of Canada has far outstripped its increase in population. The confederation of provinces took place in 1867. The following table gives the year by year exports of agricultural products taken from the Trade and Navigation Returns wherein they are arranged under two groups; animals and their products, and field products. These totals can be

given only for Canada, not by Provinces. In the Government returns the exports are entered under the provinces whence they are shipped. Students are cautioned against considering these as the provinces of production. For example, as Montreal (Quebec) is the main port of export for Ontario, most of the Ontario agricultural exports are entered in the Blue Book as shipped from Quebec Province.

TOTALS OF EXPORTS — FIELD PRODUCTS AND ANIMAL PRODUCTS. 1868-1903.

	Animals and products of	Field products, etc.	Total
1868.....	\$ 6,893,167	\$12,871,055	\$19,341,387

1901.....	55,495,311	24,781,486	78,630,060
1902.....	59,161,200	37,152,688	94,517,010
1903.....	69,817,542	44,624,321	114,441,863

In the above table the years end 30 June; they are fiscal years, not calendar years.

Having given the totals as showing the steady upward movement in surplus products, it will next be in order to give some details that we may see the causes of the main increases. The following table shows that in field products the increase is due mainly to wheat and flour, and the recent increase of wheat farming on the prairies of Manitoba and the North West Territories is the key to this. The export of live animals has not changed much in the past twenty years. In animal products, cheese, bacon and butter largely account for the increase. The total of the exports of these three products in 1891 was \$10,701,907, whereas in 1903 the total was \$47,122,735. When it is considered that these are concentrated products, the result of higher agricultural skill, the secret of Canadian agricultural prosperity in recent years may be readily understood.

The Minister of Agriculture for Canada is a member of the Dominion Government and Parliament. He has under his control a well-organized department with specialists in charge of the various branches. The transportation and marketing of farm products is a matter that comes particularly under his

care. The starting of various lines of work in the newer provinces, such as dairying and stock raising, has received special attention, the practice being to hand this work over, when successfully going, to the local Provincial Departments. The Dominion Department has a well arranged series of experimental farms. The central farm is at Ottawa, Ont.; the branches are at Nappan, N. S.; Brandon, Man.; Indian Head, N. W. T.; and Agassiz, B. C. All are under the control of one Director and each farm is interested in carrying on experiments profitable to the Province in which it is situated.

Ontario.—The settlement of Ontario began in 1784, when several thousand Loyalists, mainly from New York and New Jersey, moved in at the close of the Revolutionary War. They were of mixed nationality and took up land on the frontier from Detroit in the west to the present eastern limits of the Province on the St. Lawrence a few miles above Montreal. In the clearing away of the forests timber and potash were the two marketable farm products. As the cleared land increased wheat became a surplus product. The over-sea immigration began in 1816 after the close of the Napoleonic wars, became quite large about 1825, and continued

down to the middle of the century. Up to this time the population was mainly rural; the following statement of population, therefore, will fairly indicate the growth of the farming population.

1784.....	about 10,000	1841.....	about 500,000
1812.....	about 75,000	1848.....	about 726,000
1824.....	about 157,000	1851.....	952,000

The middle of last century was the "growing time" in Ontario, and at that time wheat was king. This branch of farming received a remarkable impetus during the Crimean War, 1854-6 and at the same time the Reciprocity Treaty between Canada and the United States permitted the interchange of the natural products of the farm. (See CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES.) This period of inflated prices was prolonged by the Civil War in the United States and continued down to 1865. The year 1866 marks a new era in Ontario agriculture. The Reciprocity treaty was discontinued and a tariff wall erected in its place. European grain prices had come down and wheat growing in Ontario suffered as a consequence. The British settlers that had been coming in a steady stream across the Atlantic during the pre-

* This list does not include Furs, as they are not agricultural products. This accounts for the totals of this table being somewhat less than those of preceding.

vious two decades had introduced a new element — they brought with them an acquaintance with and love of high class stock of all kinds. Dairying, sheep breeding, the rearing of pure bred beef animals and of heavy horses, now brought some relief to the farmer. Gradually he built up also a big barley trade that was temporarily very profitable but ultimately ruinous to the farm lands. The competition of the rich cheap farm lands of the Western States now began to tell upon Ontario farming and the struggle was acute. Here and there a bright year intervened. The 6th of October 1890 started a new era, apparently worse than the preceding, for then the McKinley Tariff came into operation and at one sweep the agricultural trade with the United States completely disappeared. Barley, eggs, butter, mutton, poultry, horses and many other products that had been shipped to the South, dropped in value and the farmer was face to face with the most serious situation he had known since the days of pioneer hardship.

The tale as told in figures is interesting. In the three years prior to the McKinley Tariff (1888, 1889 and 1890), the Canadian Agricultural exports to the United States amounted to \$46,500,000; in the three years following the same, (1892, 1893 and 1894) they amounted to only \$20,400,000. There is, however, another side to the story and this is an interesting part of Canadian history. In the three years, 1888, 1889 and 1890, Canada's exports to Great Britain averaged \$20,000,000 a year; for the three

years, 1900, 1901 and 1902 they averaged \$71,500,000. The loss in the United States market has thus been made up over and over again in the British market. This forced seeking for a new market has brought about a very important change in Ontario farming, and the progress made in the past six years is most remarkable. The following statement briefly tells the story. It is taken from the annual reports of the Ontario Department of Agriculture.

PRODUCTION OF ONTARIO FARMS.

	1896	1902	Increase
Beef	\$12,000,000	\$23,000,000	\$11,000,000
Bacon and pork....	10,000,000	20,000,000	10,000,000
Cheese	9,000,000	15,000,000	6,000,000
	\$31,000,000	\$58,000,000	\$27,000,000

If we add other products, we may state that in 1902 and 1903 the farm products of Ontario were worth from \$35,000,000 to \$40,000,000 more than they were six to ten years ago. In other words, the average income of the 175,000 farmers in 1903 was at least \$200 more than six years ago. As it cannot be supposed that all farmers have participated equally in this gain, it will be seen that the increased profits of the more progressive among them must have been very great. Therein is the explanation for the continuance of good times in Ontario down to the middle of 1904, when this article is being writ-

CANADA — AGRICULTURE

ten. The steady increase in the numbers of live stock kept on Ontario farms has resulted in a steady improvement in the production of grain and forage crops, but these have not been marketed as crude products but have been turned into beef, bacon, and cheese. The above table, in brief, represents the greatest and most important factor in the Ontario agriculture of recent years.

Fuller details cannot be given here, but those who may desire a more minute study of this question will find full information in the annual reports issued by the Ontario Bureau of Industries, the statistical branch of the Department of Agriculture, Toronto, Ont. The breeding of pure bred stock is an important part of Ontario agriculture. Clear air, clean water in abundance and good pasture are there found, while as stated above a large number of the farmers have come from the British Isles where live stock breeding and feeding form so important a part of farm work. Fruit growing is steadily increasing in the Province. The most southern point of Ontario is in the same latitude as Chicago and Boston, and Southern France and Central Italy. The Great Lakes have a modifying and controlling influence on the climate. The consequence is that while apples grow to perfection in nearly all parts of the Province, cherries, plums, pears, peaches and grapes are very profitably grown along the borders of the lakes. As a rule the fruits of Ontario are of high flavor. Probably the greatest surprise that comes to a stranger in making a personal study of Ontario is the finding of such a wide range and great abundance of sub-tropical fruits of large size and fine flavor. As an outcome of this there are many extensive fruit canning plants in Ontario. Dairying has for many years been a leading industry. Butter making in creameries has not been so extensive as cheese making in factories. In 1883 there were 635 cheese factories: in 1902 the number was 1,127. The output in the same time increased from 53,500,000 lbs. to 146,800,000 lbs. Most of these factories are conducted on the co-operative plan. The improvement in agricultural methods and the increasing production of concentrated high class products should show an effect in increasing farm values. The following table is therefore interesting as summing up in a condensed form the farm progress of the past few years. It is compiled from the annual reports of the Provincial Department of Agriculture.

ganized along all lines of agricultural work having, under the Deputy Minister, specialists in charge of the various branches. Through it is directed the Agricultural College and Experimental Farm at Guelph; Farmer's and Women's Institutes, that hold about one thousand meetings every year; three dairy schools at Guelph, Kingston and Strathroy; thirty instructors who give instruction at the cheese factories and creameries; six live stock associations that are interested in the breeding and exporting of pure bred stock and the holding of Winter Shows at Guelph and Ottawa; the direction of twelve fruit experiment stations; the superintendence of 300 Agricultural Societies; and many other lines of work. The Department prints and publishes all the bulletins and reports prepared at the Agricultural College and by the various Societies and Associations, and also collects, compiles and publishes annually bulletins and reports on crops and farm statistics.

Quebec.—The rural population of Quebec consists of two classes or nationalities. The original settlers from France were located as tenants on the seigniories along the Saint Lawrence River; while the English-speaking settlers from Vermont, New Hampshire, and other northern States, coming in by way of Lake Champlain, settled in the district adjacent to the Lake, still known as the Eastern Townships. These two classes carry on agricultural work of an entirely distinct nature. The French Canadian farms are long and narrow; their houses and outbuildings are peculiar; their cattle and horses trace back to Norman and Breton types, and their methods of work are characteristically French. The English-speaking farmers of the Eastern Townships make specialties of live stock and dairying and their style of farming is quite similar to that of Ontario.

The Minister of Agriculture at Quebec has a department to carry out his work. He is assisted also by a representative Council of Agriculture. Agricultural Societies exist in all the counties. There is a vigorous Provincial Dairy Association, having supervision of a Dairy School at Saint Hyacinthe. There are agricultural schools or colleges in various parts of the Province conducted by religious orders that are assisted by the government.

Nova Scotia.—This Province has 172 agricultural societies with about 10,000 members. Through these societies pure bred animals are imported and distributed. Dairying is increasing,

VALUES OF FARM LANDS, BUILDINGS, IMPLEMENTS AND LIVE STOCK.

The public direction of agricultural work in Ontario is by the Provincial Department of Agriculture at Toronto, presided over by the Minister of Agriculture, who is a member of the Provincial Government. This Department is or-

there being in 1903, 18 creameries, 13 cheeseries and 4 condensers. Fruit growing, however, is the most advanced branch of Agriculture. The apples of the Annapolis and other valleys have a world wide reputation. In order to extend this

CANADA — AGRICULTURE

industry the Provincial Department of Agriculture has started model orchards in various counties. The Province exports from 500,000 to 1,000,000 barrels of apples in good yielding years. There is a school of horticulture at Wolfville. A school of agriculture is now being organized at Truro. Agriculture is taught in the public schools of this Province.

New Brunswick.—Like Nova Scotia, New Brunswick has derived its wealth from fisheries and forests rather than the cultivated field. Agriculture, however, is improving. Dairying is extending: there being now 40 butter factories and 55 cheese factories. A very successful dairy school has been conducted for some years at Sussex, N. B.

Prince Edward Island.—This is a fertile province with mild summer climate and possessing all the requirements for a fine stock country. Potatoes and mutton are the two special products. There are 52 cheese factories. Agriculture is taught at the Prince of Wales College, Charlottetown, the Professor of Agriculture having charge of experimental work for the whole Island.

British Columbia.—The largest Province of Canada, derives its wealth from forests, mines and fisheries. Agriculture as a serious business is of comparatively modern origin. The long valleys of the south and west possess a very rich alluvial soil and have a mild climate. Fruit culture is one of the most promising branches; the trees mature early and yield heavily. There is now a limited quantity of fruit available for export. The more progressive farmers are, with the help of the Provincial Department of Agriculture, importing pure bred breeding stock from Ontario, the great centre of live stock for all Canada.

Manitoba and the North West Territories.—The agricultural story of this great region is told most briefly in the following tables

	Acreage prepared for crop 1904	Total suitable for cultivation
Manitoba	2,385,505 acres	27,000,000 acres
N. W. Territories ..	1,706,100 acres	144,000,000 acres
Totals	4,091,605 acres	171,000,000 acres

Land cultivated in 1904 is therefore 2.3 per cent of the cultivable land.

CANADA — MINERALS

Manitoba has a vigorous Department of Agriculture, collects and publishes crop bulletins, maintains a dairy school, and is just now establishing an agricultural college near Winnipeg. See CANADA—THE GRANGER MOVEMENT; CANADA—COMMERCE, TARIFFS, AND TRANSPORTATION; AGRICULTURE.

C. C. JAMES,
Deputy Minister of Agriculture for Ontario.

Canada — Minerals. From a country so vast and of such varied geological structure as Canada one expects a wide range of mineral deposits, and the expectation is not disappointed, for already most of the minerals known to exist elsewhere have been found in the Dominion, and often in important deposits, though only its southern fringe has been explored. However, up to the present, Canada's mineral production must be looked on as at the stage of promise rather than performance, except in a few substances where nature has given her the lead. For example, the world's supply of asbestos comes from the province of Quebec, and more than half of its supply of nickel is obtained from a single mine in Ontario, while the richest placer gold region is in the Yukon territory (see KLONDIKE, THE; ALASKA). On the other hand, Canada is backward in the production of iron and steel, basic factors in the development of a country, and stands low as a producer of coal, though the fact that the only deposits of good coal on tide-water in America, both on the Atlantic and Pacific, are Canadian is a fact of much importance which has produced great metallurgical industries in Nova Scotia.

Until recently the exploitation of Canadian mineral resources has been largely due to foreigners, especially Americans; but Canadian skill and capital are now turning in this direction. In 1903 the total value of the mineral products of Canada was \$63,222,510, about \$11 for each inhabitant, as compared with \$15 per capita in the United States, where the total reached \$1,250,000,000 in 1902. The area of Canada is about equal to that of the United States, and in the parts best explored its mineral resources give promise of equaling in value those of corresponding States of the Union; so that an immense expansion in mining is to be looked for in the next generation.

The mineral production of Canada is very unequally distributed among the provinces, British Columbia coming first, followed by Ontario, the Yukon and Nova Scotia, with the remaining provinces far in the rear. In per capita production the order is different, Yukon territory, with its tiny population of 20,000 or 30,000, almost equaling Ontario with more than 2,000,000 inhabitants, while British Columbia stands second and Nova Scotia third.

Of the maritime provinces of eastern Canada only Nova Scotia can be described as a mining region, gold and coal having been produced there for nearly half a century. Quebec is not of great importance except for its asbestos mines. Ontario produces a variety of minerals, nickel being the foremost, while British Columbia provides gold, silver, copper, lead, and coal; and the Yukon gold.

Following the usual classification, the minerals of Canada may be taken up under three heads, metals, non-metallic minerals, and structural materials.

METALS.

Ores of 13 metals have been mined in Canada, antimony, chromium, cobalt, copper, gold, iron, manganese, mercury, molybdenum, nickel, platinum, silver, and zinc, and minerals containing a number of other metals have been found, though they have not yet been mined. Only six of these metals are prominent economically, gold, silver, nickel, copper, lead, and iron, and attention will be directed mainly to them.

Gold.—The gold areas of Canada are widespread but the production has been very fluctuating, the value in recent years varying from \$907,601 (in 1892) to \$27,908,153 (in 1900), and standing at \$18,834,490 in 1903. In 1900 Canada was third in rank as a producer of gold, being surpassed by the United States and Australia only; but has dropped to the fifth place since then, yielding to South Africa (see AFRICA—*Geology, Minerals*; TRANSVAAL) and Russia (see RUSSIA—*Minerals*). Three provinces and one territory are gold producers at present. Nova Scotia has carried on quartz mining, on "saddle reefs" like those of the famous Bendigo region in Australia, for more than 40 years, and of late has exceeded \$500,000 per annum, the value reaching \$627,357 in 1902. Ontario also produces gold from quartz mines, but with less steadiness than Nova Scotia, the value running from \$421,591 in 1899 to \$188,000 in 1903. Before the sudden rise of the Klondike, British Columbia was the greatest gold region of Canada, its history beginning with the times of wild excitement in the '60s, when thousands of miners from California swarmed into the rich placers of the Fraser and Columbia rivers and washed out millions of dollars worth, reaching the climax of \$3,913,503 in 1893. The easily available placers were gradually exhausted, the value falling in 1893 to \$379,535, a little less than the output of Nova Scotia in the same year; but the production of lode gold, especially from the smelting ores of Rossland, on the southern edge of the province, has once more placed British Columbia in the first rank. In 1902 the yield was \$5,961,409, of which \$1,073,140 came from placer mines, mostly in the Cariboo and Athlone districts in the north, the rest from smelting ores and a few quartz mines in the south.

The territories have furnished a small amount of placer gold from bars on the Saskatchewan and other rivers for a number of years, but it was not until the working of the Klondike placers in 1897 that gold mining assumed importance in the north. This region, in lat. 64°, 500 miles below the head-waters of the great Yukon River, is unique as a placer mining country, reminding one of the famous placers of California and Australia, but surpassing them in difficulty of access and of working conditions, as well as in richness. For its length Eldorado Creek, a tributary of Bonanza Creek, was the most productive ever mined, but its gravels are nearly worked out, and the yield of gold, though still great for so small a region as the Klondike, which is about 40 miles square, has fallen since 1900, when it was estimated at \$22,275,000, to \$12,250,000 in 1903. The gold-bearing gravels are perpetually frozen and usually buried under several feet of frozen muck, so that the ground must be thawed before it can be worked. At first this was done by building fires, but more recently steam delivered from steel pipes driven into the ground has been employed, and it is

CANADA — MINERALS

found, also, that when stripped of moss the warm summer's sun thaws layer after layer, which may then be sluiced off in the ordinary way. As methods are improved and the cost of living diminishes, much poorer gravels can be worked profitably, so that the placers of Yukon territory will no doubt be productive for a generation to come, even if no important new finds are made. It is probable, however, that the Klondike output will slowly diminish or only hold its own in the future, and that the British Columbian production will increase, leaving the total for Canada not very different from what it is now. See **GOLD** — *World's Production*.

Silver.—A generation ago Ontario was the chief province for silver, the Silver Islet mine near Thunder Bay, on the north shore of Lake Superior, being credited with a production of \$3,250,000, while several other mines were worked west of Thunder Bay; but in recent years British Columbia has taken the lead, beginning in 1895 and culminating in 1897 so far as value is concerned, with more than \$3,000,000 worth. The fall in the price of silver, and also of lead, with which it is always associated in British Columbian ores, has caused a serious shrinkage in production, only 3,182,000 ounces, valued at \$1,700,779, having been reported from the whole of Canada in 1903. Of this a small amount was derived from the gold of the Yukon and trifling quantities from Ontario and Quebec, the rest from British Columbia, where the mines of the Slocan region in the south are most important. See **SILVER** — *Silver-producing Districts*.

Nickel.—This metal has become of practical value only within the last 20 years, and methods of reducing its ores are still somewhat in the experimental stage. The world's supply comes almost entirely from two regions, the Sudbury district in northern Ontario and the French penal colony of New Caledonia. Until the last year or two New Caledonia was somewhat in advance, but in 1903 Sudbury passed it in production and seems likely to hold its position in the future. The mines are all situated round the edge of a basin-shaped sheet of eruptive rock 37 miles long and 15 broad, and among them the Copper Cliff, which is about 1,000 feet deep, produces the richest ore, while the Creighton, a few miles to the west, is the greatest nickel mine in the world, supplying 18,000 tons of ore per month. Nearly as much copper as nickel is produced in these mines, and also small amounts of cobalt, gold, and platinum, the last metal occurring in the rare arsenide sperrylite, first found in the district. In 1903 matte smelted from the roasted ore contained 6,998 tons of nickel, mostly mined and treated by the Canadian Copper Company. The value of the nickel in the matte was placed at \$2,499,068, while the refined metal was estimated to be worth \$5,000,000. See **NICKEL**.

Copper.—Copper has been mined in Newfoundland, Nova Scotia, New Brunswick, Quebec, Ontario, and British Columbia, but only the last two provinces are important producers. The copper of Quebec is a by product of the iron pyrites of the Eastern Townships; and most of the copper from Ontario is, as shown above, produced as an accompaniment of the Sudbury nickel ores, though mines of copper alone are worked at Massey and one or two other points in western Ontario, not far from the

once well-known Bruce mines, north of Lake Huron, which were prosperous half a century ago but are no longer worked. British Columbia supplies more than three fourths of the copper mined in Canada, chiefly from the gold-copper ores of the Rossland region and the large low grade deposits of the Boundary district, but numerous other deposits are known along the Pacific coast of the province and in the White Horse district of Yukon territory. The total production of copper in the Dominion in 1903 was 21,640 tons, valued at \$5,728,261. See **COPPER**, **WORLD'S OUTPUT OF**.

Lead.—Almost the whole of the lead mined in Canada comes from the silver-lead ores of southern British Columbia, which began to be opened up extensively in 1893 and furnished 31,500 tons in 1900, but sank in 1903 to 9,000 tons with a value of \$762,660. The falling off is attributed to adverse conditions imposed by the smelters of the Western States, which had bought the ores at advantageous rates in former years. To stimulate lead mining, and smelting in British Columbia the Dominion government has provided a bounty on lead smelted and refined in Canada, and it is expected that lead mining will recover some of its former prosperity. See **LEAD**.

Iron.—In regard to the most important of all metals, iron, Canada is backward, largely from the fact that the ore deposits and the fuel for treating them are generally widely sundered. Nova Scotia, Quebec, and Ontario are producers of iron and steel, the first province having the great advantage of supplies of coking coal on the seaboard, at Sidney in Cape Breton Island and other points, so that two large iron and steel plants are in operation there. Most of the ore smelted is, however, in a sense foreign, coming from Bell Island, off the coast of Newfoundland. The province of Quebec has for generations smelted a small amount of bog iron ore in charcoal furnaces near Three Rivers, the product being of high grade and used for special purposes. Charcoal iron furnaces were operated on a small scale in different parts of Ontario, also, from 50 to 100 years ago, but when railways began to bring in British iron the industry ceased. Within the last few years large furnaces using American coke, and in part American ore, have sprung up at Hamilton, Midland, and the Sault Sainte Marie, and some charcoal furnaces have come into operation.

Deposits containing millions of tons of fair grade ore have been found in Hutton township, Michipicoton, and other points in northern Ontario in rocks similar to those of the great iron regions of Michigan and Minnesota, so that iron production is likely to increase in the future, particularly since the governments of the Dominion and of the province have provided bounties for iron and steel of home production. British Columbia also possesses large deposits of iron ore and excellent coking coal, so that an iron industry like that of Nova Scotia may be expected to grow up as the province becomes more populous. In 1903 the amount of pig iron produced in Canada was 297,885 tons, valued at \$3,742,710, of which, however, only 42,052 tons were from Canadian ore, the rest being from Newfoundland and American ores. The quantity of steel produced is not given, but in the previous year it was 182,037 tons. See **IRON AND STEEL INDUSTRY IN AMERICA**.

CANADA — MINERALS

NON-METALLIC MINERALS.

Twenty-three non-metallic minerals are reported in the statistics for 1903, and several others occur in lists of former years, but attention may be confined to a few of the more important ones, beginning with the mineral fuels.

Coal.—In 1903 the coal raised in the Dominion amounted to 7,996,634 tons, valued at \$15,957,940, Nova Scotia producing more than 5,000,000, and British Columbia most of the remainder, though the territories are credited with about 500,000 tons. The coal supply of the great manufacturing province of Ontario comes entirely from the United States; but, on the other hand, Nova Scotia exports 500,000 tons to the New England States and British Columbia 750,000 to California and other Western States. Besides the rich bituminous coal beds of Nova Scotia and of Nanaumoo and the Crow's Nest Pass, in British Columbia, which are the most important producers in Canada, lignite or lignitic coal of poorer quality is mined at numerous points on the prairies, which are largely underlain with seams of the kind, and valuable mines are worked in the foot-hill region near the Rockies. A few small areas in Bow Pass, nipped in during mountain building, approach anthracite in quality. Great coal fields are known to exist near the Skeena River and at other points in northern British Columbia and the territories to the north and east. The coal fields of western Canada are mainly of Cretaceous age, unlike those of Nova Scotia and the Eastern and Southern States, which are Carboniferous. In all there are probably not less than 100,000 square miles of coal fields in Canada, and the extent may prove to be much greater than this. See *COAL—Coal Fields of the World*.

Petroleum and Natural Gas.—At present Ontario is the only producer of petroleum, which comes from a small area in its southwestern peninsula. Crude oil and its products to the value of \$1,586,674 are reported in 1903, but the supply is slowly diminishing and before long will be exhausted unless other pools are struck. Petroleum is known from Gaspé in Quebec and from the Crow's Nest Pass in the Rockies, and great stretches of "tar sands" along the Saskatchewan and Athabasca suggest oil deposits, though productive wells have not yet been sunk in these regions. (See *PETROLEUM INDUSTRY, THE*.) Natural gas has been exploited in Essex and Welland counties of southwestern Ontario, but the yield of the Essex field has greatly fallen off in the last two or three years. In 1903 the wells of Ontario furnished gas to the value of \$196,535. Gas is known also and slightly put to use at Medicine Hat and Langevin, on the prairies. (See *GAS, NATURAL*.) Peat bogs exist over thousands of square miles of northern Ontario and Quebec, a reserve of fuel that may some day be drawn upon, but which is barely touched at present, though a few plants have been operated for drying and compressing peat to serviceable briquettes.

Minor Economic Minerals.—After the fuels come several less important minerals, asbestos being the chief one, with an output of 42,328 tons, valued at \$904,853. The whole product, which means practically the world's supply, comes from a few mines in serpentine rocks in

the Eastern Townships of Quebec. The value of this beautiful silky-fibred mineral depends on the fact that it is an incombustible material which can be spun and woven. Next in value is gypsum, the raw material of plaster of paris, of which 307,489 tons are reported, worth \$384,259, mainly from New Brunswick and Nova Scotia. Salt is produced to the amount of 53,537 tons, valued at \$334,088, from wells in southwestern Ontario; and mica is mined in the provinces of Ontario and Quebec, to the value of \$159,473, Ontario being the largest producer in the world of this mineral, so important as an insulator in electric machinery. Pyrites, used chiefly in the chemical industries, is produced to the value of \$126,133 in Quebec; and a new item has recently appeared in the statistics of Ontario, corundum, the hardest mineral next to diamond. In 1903 the output was valued at \$87,600, and the crushed material is beginning to replace emery as an abrasive. Although these deposits of corundum are the largest known, the gem varieties, ruby and sapphire, have not yet been found in the province. Among minor non-metallic minerals may be mentioned chromite, mineral paints, graphite, feldspar, diatom earth, and arsenic, having an annual value of from \$15,000 to \$35,000 each.

STRUCTURAL MATERIALS.

Building-stone, clay for brick-making, and marl or limestone and clay for the manufacture of cement are, of course, found in all the provinces; but the greater part of the clay products and almost all the cement are manufactured in Ontario, which in 1903, according to the Bureau of Mines, made brick, tile, etc., to the value of \$2,185,509, and Portland and natural rock cement worth \$1,252,118. Quebec is the greatest producer of granite and other building and ornamental stones, but definite statistics regarding them are hard to obtain. In 1903 the Geological Survey gives the following statistics of structural products of the Dominion:

Cement, natural rock.....	\$ 75,655
Cement, Portland	1,090,842
Granite	150,000
Pottery	200,000
Sands and gravels (exports).....	124,006
Sewer pipe	317,970
Slate	22,040
Terra-cotta, pressed brick, etc.....	386,532
Bricks, stone, lime, etc.....	5,650,000
Total	\$8,017,045

It will be noticed that the Ontario Bureau of Mines shows a greater value for the cement manufactured in that province than the whole Dominion is credited with in the table just given, showing the uncertainty of the statistics of this class of products.

Summing up the mineral production of Canada in 1903, we have the following results as shown by the Geological Survey:

Metals	\$33,707,403
Mineral fuels	18,716,543
Other non-metals	2,485,519
Structural materials	8,017,045
Estimate of minerals not reported	300,000
Total	\$63,226,510

This shows a falling off since 1901, when the total was \$66,339,155, but the difference is much more than accounted for by the diminished production of gold in the Klondike. In

CANADA—THE FORESTS AND LUMBER INDUSTRY

all other departments, except the mining of silver and lead, there has been a steady advance, which may be expected to remain.

The following table, showing the production at five-year intervals, illustrates the rapidity of the increase since statistics have been kept by the Geological Survey:

1886 (first year of statistics)	\$10,221,255
1888	12,518,894
1893	20,035,082
1898	38,697,021
1903	63,226,510

It will be seen that the mineral production has nearly doubled every five years, and has increased at a very much more rapid ratio than the population, which has been far from doubling since 1886, though the mining industry has gained six-fold. The prospects of advance in the future are bright.

Statistical information as to the mineral production of the country as a whole may be found in the annual reports of the Geological Survey of Canada (Section of Mines, compiled by Elfric Drew Ingall), and in the annual volumes of the 'Mineral Industry.' The mining departments of the provinces of Nova Scotia, Ontario, and British Columbia also publish annual reports of much value, in which information is given as to their special mining industries. The statistical materials for this paper have been largely drawn from these sources.

A. P. COLEMAN,

Professor of Geology, University of Toronto.

Canada—The Forests and Lumber Industry. Until further explorations are made it will be impossible to give more than a rough estimate of the vast extent and value of the forests of Canada. The total area of the Dominion is estimated at 3,315,647 square miles. Of this about 40 per cent, or 1,326,258 square miles, is supposed to be in forest. Not only is the area of vast extent, but the varieties of trees are very numerous, and among them are found some of the most valuable species. Professor John Macoun gives 121 as the total number of indigenous species. Among these are the different varieties of the pine, spruce, fir, hemlock, cedar, oak, maple, beech, birch, poplar, basswood, elm, ash, hickory, walnut, and various others of more or less commercial value. The white pine is the tree that has brought most wealth to the people of the eastern provinces, while the fir, the cedar, the hemlock, and the spruce are the varieties of greatest value west of the Rocky Mountains. Within recent years the development of the pulp industry has brought into more general use the wood of the spruce, it being particularly well adapted for that purpose, and as it is one of the most widely distributed of Canadian trees, extending from the Atlantic on the east to Alaska on the west, and from about lat. 45° N. to the limit of tree growth, the Dominion holds an almost unlimited supply for this purpose. The Federal government has charge of the forests on Dominion lands proper. These embrace the province of Manitoba, the Northwest Territories, and also a part of British Columbia known as the Railway Belt, the last named consisting of a district 40 miles wide, 20 miles on each side of the main line of the Canadian Pacific Railway, and containing about 20,000 square miles. It is estimated that the area of forest thus under

Dominion control (not including the Indian reserves in the old provinces or those in British Columbia) is 742,578 square miles, while that under the control of the Provincial governments is 506,220 square miles. It has been the policy for many years of both the Federal and Provincial governments to grant licenses permitting the holders to cut timber on certain areas of the Crown domain. These licenses are obtained by public competition, and only give the owners the exclusive right to cut within the areas specified. They get no rights to the land, and in addition to the bonus paid at the time the license is given a specified annual ground rent is collected, and also in most cases stumpage dues of a stated amount per thousand feet when the timber is cut.

The report of the Department of Trade and Commerce for the year ending 30 June 1903, shows the value of the exports of forest products of the Dominion for that year to be \$36,386,015. The figures also show an average increase for the past five years of nearly \$2,000,000 per annum, while the increase of last year over the preceding one is over \$4,000,000. This trade is at present mostly confined to Great Britain and the United States, the exports to the former last year being valued at \$16,742,435, and to the latter at \$16,977,232: while those to all other countries only amounted to \$2,666,348. But with the increased demand for lumber in foreign countries, and especially of those bordering on the Pacific Ocean, both in South America and eastern Asia, and the ability of British Columbia to furnish a large supply, it is improbable that these proportions will be long maintained. This province is destined in a few years to take a prominent, if not a leading, place with her sister provinces of the East in the lumber trade of the country. It should be noted that the exports give only a comparatively small part of the total products of the forests, and as the census returns for 1901 are not yet (1904) fully tabulated it is impossible to give as full information as is desirable. These returns, however, give the value of the products of the saw- and pulp-mills alone for the previous year as \$53,051,865, while the capital invested was \$67,164,226, the number of employees 54,726, and the wages paid \$12,198,914. They also show the raw products to amount to \$51,082,695, made up as follows: From Ontario, \$21,351,898; Quebec, \$18,969,716; Nova Scotia, \$3,409,528; New Brunswick, \$2,998,038; British Columbia, \$2,634,157; Manitoba, \$950,057; Northwest Territories, \$484,263; Prince Edward Island, \$285,038. But all these figures together give only a part of the value that the inhabitants derive from their timber. It is used by the backwoods pioneer in a rough state for his dwelling and other farm buildings, for fencing and fuel, and for numerous implements in his daily use, and it furnishes employment to a large section of the population in the manufacture of articles in which wood is the chief ingredient. Not only are the forests of Canada of vast extent, but the facilities for floating logs to the mills for manufacturing are perhaps unequalled in any other country. It is pre-eminently a land of forest, lake, and stream. Great stretches of country form the basins from which certain large rivers derive their waters. Within each of these is an almost endless number of lakes of all dimensions, connected by streams

CANADA—THE FORESTS AND LUMBER INDUSTRY

of varying sizes, but all serving as feeders to the great river which serves as their outlet. The timber is usually cut in the winter and drawn to one of these streams. There it remains till the spring opens, when it is carried by the current down to its destination. In many cases no rafting or towing is necessary. All that is required is that a few river men watch the "drive" till it reaches the boom at the mill. The facilities afforded for the development of water-power are very great, and many of the saw-mills, pulp-mills, and various other industrial establishments are run by such power. While the percentage of land in forest in Canada as a whole is very large, there are many districts in the older provinces where the denudation has gone far beyond what good economic conditions demand, and the yearly destruction caused by spring floods is followed by the consequent summer drought. The census of 1901 gives the percentage of woodland on the farms in the five eastern provinces as follows: Ontario, 22 per cent; Quebec, 38 per cent; New Brunswick, 57 per cent; Nova Scotia, 56 per cent; and Prince Edward Island, 30 per cent. But this favorable condition is made by the large proportion of forest still existing on the farms of the pioneer settlers in the newer districts, counterbalancing the prairie-like condition of many of the older settlements, in some of which 5 per cent of woodland would be an over-estimate.

The practice of reserving from settlement certain areas of land for timber reserves has been adopted within recent years in Dominion territory, and also in the provinces of Ontario and Quebec. The object of reserving these tracts is not only for the supply of timber they will afford, but more especially to conserve the water supply at the sources of rivers and streams. These reserves are nearly all in elevated situations, such as the Rocky Mountains, the Riding and Moose mountains, on Dominion lands; the Algonquin Park, the Temagami and Mississauga reserves, which embrace large tracts of land at the sources of several of the large streams of northern Ontario, in Ontario; and the Laurentian National Park, at the summit of the Laurentian range of mountains, in Quebec. In 1903 the areas set aside for such purposes by the Dominion government aggregated 9,686,880 acres, while those in Ontario contained 6,928,383 acres, and in Quebec 1,619,383 acres. Forest fires have destroyed vast quantities of timber in all parts of the country, but more especially in the coniferous regions extending from Nova Scotia and New Brunswick to British Columbia. Within the last few years, however, public attention has been awakened to the necessity of greater attention being given to the subject of forestry, and the Province of Ontario and the Dominion have now each established a forestry office as a branch of the public service. The Dominion office was started in 1899. The officials consist of a superintendent, assistant superintendent, inspector, several supervisors of tree planting, and a number of forest-fire rangers. The rangers are employed for a longer or shorter time each summer, as the necessities of the case require. The Ontario Bureau of Forestry is presided over by a director, and the work of the large staff of fire rangers employed has been the means of lessening the loss of timber to a very marked extent.

Similar results have followed the work of the government fire rangers on Dominion lands, and also in the Province of Quebec.

Co-operation with the settlers in forest tree planting on the prairie lands of Manitoba and the Northwest Territories has been established within the last three years, and is now assuming large proportions. The system adopted may be briefly stated as follows: Any land owner desiring to avail himself of the co-operation of the government applies to the Forestry Branch at Ottawa. These applications are tabulated and the land of the applicant is visited by one of the supervisors the following summer, when a plan of the proposed plantation is made. The next spring seedling trees are sent by express from the government nurseries free of charge. The settler enters into an agreement to set aside a certain portion of his land as a permanent forest plantation, to carefully prepare his soil according to the directions of the supervisors, to plant the trees on their arrival, and to cultivate and keep the ground clean till such time as the trees are of sufficient size to no longer need such attention. The varieties planted will vary according to the district of country where planted and prevailing soil and climatic conditions. The work is also designed to be educative and to furnish practical object lessons of the possibilities of tree culture on the open plains. In 1901 44 settlers received an aggregate of 58,800 trees; in 1902, 415 an aggregate of 468,900 trees; in 1903, 616 an aggregate of 920,000 trees; in 1904, 1,026 an aggregate of about 2,000,000 trees. Heretofore the seedling trees for distribution have been grown on the Government Experimental Farms at Brandon and Indian Head, but it is now proposed to centralize the work, and 160 acres of land have been obtained for a forest nursery station near Indian Head, Assiniboia, where buildings are being erected and preparations made by which the supply for the whole country will be grown in, and distributed from, that place. The Agricultural Department of Ontario has also this season (1904) started to grow forest trees at the Experimental Farm at Guelph for distribution to the farmers of that province.

A Canadian Forestry Association was organized in 1900, which is proving a very useful institution and doing much in the interests of forestry. Its purposes, as stated in its constitution, are: (1) To advocate and encourage judicious methods in dealing with our forests and woodlands. (2) To awaken public interest to the sad results attending the wholesale destruction of forests (as shown by the experience of older countries), in the deterioration of the climate, diminution of fertility, drying up of rivers and streams, etc. (3) To consider and recommend the exploration, as far as practicable, of our public domain and its division into agricultural, timber, and mineral lands, with a view of directing immigration and the pursuits of our pioneers into channels best suited to advance their interests and the public welfare. With this accomplished, a portion of the unappropriated lands of the country could be permanently reserved for the growth of timber. (4) To encourage afforestation wherever advisable, and to promote forest tree planting, especially in the treeless areas of our northwestern prairies, upon farm lands where the proportion of woodland is too low, and upon highways and in the parks of

CANADA — FISHERIES

our villages, towns, and cities. (5) To collect and disseminate, for the benefit of the public, reports and information bearing on the forestry problem in general, and especially with respect both to the wooded and prairie districts of Canada, and to teach the rising generation the value of the forest with the view of enlisting their efforts in its preservation. The officers embrace leading men from all parts of the Dominion, and reports of the annual meetings are printed in attractive form and widely distributed. The Association is now about taking another forward step in publishing a quarterly periodical, which will be devoted entirely to forestry. Action is also being taken to establish a course of study in forestry in certain colleges in the country. Altogether, the attention of the general public is now being directed in various ways to the necessity of greater attention being given to this subject than has been the case in the past.

E. STEWART,

Dominion Superintendent of Forestry.

Canada — Fisheries. Among the great industries of Canada the fisheries stand fifth in the order of value. The farming industry (mainly grain-growing) is estimated to yield \$208,000,000 per annum; the lumber industry \$80,000,000; stock-raising \$75,000,000; mining \$65,000,000, while the fishing industries are estimated to produce, on the whole, \$35,000,000 to \$30,000,000 annually. This estimate is much in excess of that reported in official returns. The latest report of the Marine and Fisheries Department, which gives the value for 1902, places it at \$21,959,433; but when account is taken of the amount of fish consumed by wandering tribes of Indians and Eskimo, with their hordes of fish-eating dogs, as well as the amount used as food by isolated settlers, miners, prospectors, lumberers and sportsmen and, above all, the employees at the Hudson's Bay Company's posts in the remoter parts of northern Canada, the total amount must be greatly in excess of official statistics.

Completely accurate returns are hardly possible, admirable as the Canadian system of gathering statistics is, so admirable that the late Prof. Brown Goode, head of the United States Fish Commission, declared at a fisheries conference in 1883 that " . . . other countries ought to study it with a great deal of care." The domestic consumption of fish in the Dominion is stated, on high authority, to be not less than 100 pounds per head annually, as compared with 30 pounds in Britain.

The expansion of the Canadian fisheries since 1870 is sufficiently shown by the figures given below:

1870.....	\$6,577,391	1887..	\$18,386,103
1871.....	7,573,199	1888.....	17,418,510
1872.....	9,570,116	1889.....	17,655,256
1873.....	10,754,997	1890.....	17,714,902
1874.....	11,681,886	1891.....	18,977,878
1875.....	10,350,385	1892.....	18,041,171
1876.....	11,117,000	1893.....	20,686,661
1877.....	12,095,934	1894.....	20,719,573
1878.....	13,295,678	1895.....	20,190,338
1879.....	13,529,254	1896.....	20,407,425
1880.....	14,499,079	1897.....	22,783,546
1881.....	15,817,162	1898.....	19,667,121
1882.....	16,824,092	1899.....	21,891,706
1883.....	16,958,192	1900.....	21,557,639
1884.....	17,766,404	1901.....	25,737,153
1885.....	17,722,973	1902.....	21,959,433
1886.....	18,679,288		

Number of Boats, Fishermen, etc.— Over 1,200 vessels (valued at \$2,620,661) and 41,667

boats (valued at \$1,199,598) are employed, while the fishing gear used, including nets, lines, lobster-traps, etc., is valued at over \$3,000,000. Certain branches of the fisheries have developed in a special degree, such as the salmon canning industry on the Pacific coast, and lobster packing on the Atlantic coast. The former, embracing about 80 canneries, represents an investment of about \$3,000,000, while the Atlantic lobster canneries, in Quebec and the three maritime provinces, numbering over 750, are valued at about \$450,000. Smoke-houses, curing and refrigerating establishments, in operation, are officially recorded at \$3,153,838 in value. In other words, a capital of over \$12,000,000 is employed in these various branches of the fisheries.

The total number of persons engaged either in fishing or in handling fishery products in Canada reaches about 80,000, of whom 60,000 take part in Atlantic fishery enterprises. On the Pacific coast 4,000 or 5,000 fishermen follow salmon netting, and 10,000 or 12,000 hands find employment as cannery workers, etc. The inland (fresh-water) fisheries engage a considerable number of fishermen, over 2,000 being employed in the Ontario or Great Lake fisheries, while, in Manitoba and the northwest territories, 3,000 or 4,000 men take part in the fishing operations.

Seven Fishery Districts.—Seven territorial divisions may be distinguished in a general survey of the fisheries of the Dominion, viz :

1. The Atlantic division, from Grand Manan in the south to the coast of Labrador, including the Bay of Fundy (8,000 square miles), and the Gulf of Saint Lawrence (80,000 square miles), and characterized by deep-sea and inshore fisheries for cod, mackerel, haddock, halibut, herring, lake, lobsters, oyster, seals and white whales (*beluga*). Annual value, \$10,000,000.

2. The estuarine and inland waters of Quebec and the Maritime Provinces, including fisheries for salmon (by stake-nets, drift-nets and angling), striped bass, smelt, shad, gaspereau (alewife); and in the lakes, ouananiche or land-locked salmon, lake trout, togue or lunge, etc. Annual value, \$3,000,000.

3. Great Lakes division, including Lakes Ontario, Erie, Huron, and Superior, which Canada shares with the United States, the international boundary passing practically through the centre of these vast inland seas, all of which finally empty into the river St. Lawrence. This complex system of waters, with innumerable subsidiary lakes and rivers, abounds in lake whitefish (*Coregonus*), great lake trout (*Cristivomer namaycush*), lesser whitefish (erroneously called lake herring), sturgeon, pike-perch (doré or pickerel), black bass, brook-trout, maskinongé, pike, and numerous carpioid suckers, and bearded catfish. Annual value, \$2,000,000.

4. Manitoba and northwestern division, including Keewatin, etc., whose wide expanses of fresh water, such as Lake Winnipeg, Great Bear Lake, and Great Slave Lake, yield enormous quantities of whitefish, sturgeon, pike-perch, tullibee (a peculiar lesser whitefish), pike, gold-eye (a true fresh-water herring), large river-trout and catfish. Value, inclusive of an extensive "caviare" or sturgeon-roe industry, over \$1,000,000.

5. Pacific Interior division, extending from the Okanagan, Kootenay, and Arrow waters, in

CANADA — FISHERIES

the south, to the Yukon district, in the north, and covering an area of plain, valley and mountain 1,000 miles north and south, by about 500 miles east and west, intersected everywhere by rivers and lakes, and comprising limited fisheries for lake-trout, whitefish, land-locked salmon, river-trout, grayling, and numerous carps or suckers, not identical, for the most part, with eastern species. Annual value probably not exceeding \$500,000.

6. Pacific Coast division, the fisheries of which are little developed, if we except the estuarine and coastal salmon fisheries. The various species of salmon (belonging to the genus *Oncorhynchus*) include the blue-back or sock-eye, the spring salmon or quinnat, the coho, dog-salmon, humpback salmon, and a true *Salmo*, namely, Gairdner's salmon or steel-head. Halibut, skill or black cod, oolachan (candle-fish), anchovy, herring, sardine, smelt, and a great variety of other fishes, abound, which are not to any adequate extent utilized. Shark, dog-fish, rat-fish or chimæra, and whale fisheries exist, and there are limited oyster fisheries, while the famous fur-seal fishery (value \$400,000 to \$500,000 per annum, and employing nearly 1,000 men) is of importance, and is mainly an oceanic industry. Annual value, \$6,000,000, though in special years that amount may be exceeded.

7. Hudson Bay and Peri-Arctic division, from Ungava Bay, Labrador, to the Mackenzie River, or rather Herschell Island, Yukon district. Whale, walrus, sea-trout, Hearn's salmon, (a great spotted trout), the inconnu (resembling a river whitefish), pike, suckers, sturgeon, and possibly, salmon and cod, occur in these vast northern waters, of which Hudson Bay alone exceeds the Mediterranean in extent and has an estimated drainage area of 2,700,000 square miles. The richest whaling grounds in the world are in these remote regions of the Dominion, whose tidal channels, as the late Sir John Schultz declared, "are destined to be the last home of the leviathans which within the memory of living man have been driven from Newfoundland latitudes to the places where their survivors have now sought retreat." Hair-seals of various species, and white whales (*Beluga*), abound in these sub-arctic waters, and constitute valuable fisheries; one station, according to Dr. Robert Bell, securing no less than 2,800 of these small whales in one season.

Marine Fishing Grounds: Area, Kinds of Fish, etc.—The waters grouped in this seven-fold manner afford a field, hardly to be surpassed, for the development of extensive fisheries. The grounds, where fishing can be remuneratively carried on, off the eastern and western sea-board, embrace a total area of no less than 200,000 square miles, the Atlantic shore being over 5,000 miles in length, while the Pacific shore (British Columbia) exceeds 7,000 miles. On this latter coast, Hecate Straits (20,000 square miles) and the straits between Vancouver Island and the mainland, namely, the straits of Georgia and Fuca (15,000 square miles) afford the most remarkable sheltered fishing grounds in the world, being for the most part shielded from the open ocean, and extending inland as placid fiords and deep, salt-water inlets, the total area of these inshore waters being no less than 40,000 square miles in extent. The Canadian fishing banks on the Atlan-

tic coast are historic. They stretch from Labrador, Anticosti, and Gaspé in the north to the West Isles in the southern Passamaquoddy waters, including famous areas like the Bay of Chaleurs, off Quebec Province, Northumberland Straits, off Prince Edward Island, and New Brunswick, and Chedabucto Bay, off eastern Nova Scotia. Between the outer edge of the inshore areas and the deep-sea waters of the Atlantic the feeding and breeding grounds occur for cod, haddock, mackerel, and other valued edible fishes. "There is probably no part of the world," said Mr. P. L. Simmonds, the well-known fishery authority, "where such extensive fisheries are to be found, as in the Gulf of Saint Lawrence." Among the series of banks mainly resorted to by Canadian fishing boats are (passing from north to south) Great Bank, Green Bank, Bank Saint Peter, Misaine, Canso, Quero, Howe, Roseway, La Havre, and George's Banks, apart from the great fishing areas in the open Atlantic, such as the Grand Banks, which are not really in Canadian limits and are indeed mainly exploited by fishermen from more distant countries.

Fresh-water Fisheries.—If, owing to the superficial extent, and, no less, the coldness and purity of the marine waters of Canada, as well as the abundance of natural food, upon which cod, mackerel, halibut, herring, etc., subsist, the sea fisheries rank amongst the best in the world, it may be said of the fresh-water fisheries, that they are hardly inferior in these characteristics. The total area of the fresh waters of the Dominion (lakes and rivers) is estimated at 140,000 square miles. From a fisheries' point of view, the lake systems of Canada may be arranged under five principal heads, namely:

Five Lake Systems.—1. The maritime lakes, embracing the numerous lakes of Labrador, Quebec, and the Atlantic provinces. Certain of these, notably, Lake Saint John, Quebec (366 square miles), and the Chamcook Lakes, N. B., are famous for land-locked salmon, so prized for their unique game qualities. Black bass, pickerel or doré, lake-trout, red and speckled trout, abound in these waters, while Clear Lake, Little Seal, Mistassini, and most of the northern lakes swarm with whitefish and sub-arctic varieties of trout.

2. The central lake system, including the Great Lakes (76,562 square miles in total area) and innumerable subsidiary lakes, all utilized for commercial purposes and for sport. The areas and maximum depths of the more important of these lakes are as follows: Superior, 31,200 square miles, 160 fathoms deep; Huron, 23,800 square miles, 145 fathoms deep; Erie, 10,030 square miles, 35 fathoms deep; Ontario, 7,330 square miles, 123 fathoms deep; Lake Nepigon, 1,450 square miles; Lakes Saint Clair and Simcoe, 300 square miles each.

3. The Manitoba and Keewatin system, the principal waters of which are Lake Winnipeg, 9,400 square miles; Lake Winnipegosis, 2,030 square miles; Lake Manitoba, 1,900 square miles; and Lake of the Woods, 1,500 square miles; and in these waters enormous fishing operations are carried on for whitefish, pickerel, or doré, sturgeon, pike, etc.

4. The Athabasca and Mackenzie system, extending from Reindeer Lake to Great Bear Lake, the latter lake no less than 11,200 square miles in area, while Great Slave Lake is 10,100

CANADA — FISHERIES

square miles, and others are: Athabasca 4,400 square miles; Reindeer Lake, 4,000 square miles; Woolaston and Doobount lakes, each over 2,000 square miles in extent. These waters have been little fished, excepting by Indians, Hudson's Bay Company employees, and the like, but being prolific in whitefish, sturgeon, etc., the development of great commercial fisheries in the near future is assured.

5. The Pacific Interior system from Lakes Labarge and Atlin to Shuswap Lake, and the Kootenay, Arrow and Okanagan lakes near the United States boundary. None of the lakes in this western series are comparable in area to the vast inland seas referred to above, but such waters as Babine Lake (250 or 300 square miles) at the head of the Skeena River, and Stuart Lake, and Quesnelle lakes (respectively 100 and 750 square miles in area) at the head of the Fraser River, have an importance wholly disproportionate to their size, owing to the fact that their creeks and tributary streams are the great spawning resorts of various species of Pacific salmon. Whitefish, lake-trout, Pacific trout of various species, and grayling occur in these waters.

Rivers of Canada.—Fisheries are also conducted upon the rivers, which almost without exception, are abundantly supplied with the most esteemed fishes. Apart from a great stream like the river Saint Lawrence, whose drainage area is estimated to be 307,000 square miles, there are rivers, like the Mackenzie (2,400 miles long); the Great Saskatchewan (1,900 miles); the Churchill and Back rivers (each 1,500 miles); the Fraser (750 miles long and draining 100,000 square miles); the Red River (600 miles), and others like the Peace, Nelson, Albany, Great Whale, Skeena (300 miles); Ottawa (600 miles), Saint John (500 miles); Restigouche, Saguenay, and Miramichi; all of which are great rivers, presenting for the most part unsurpassed scenic grandeur, and affording notable sport and extensive commercial fishing. It would indeed be difficult to parallel the Fraser River, with its incredible multitudes of salmon, while the Restigouche and other famous angling rivers emptying into the Atlantic Ocean have no peers in the annals of sport. "Canada," as Prof. Elwyn said, "is the paradise of the angler."

Minor Fisheries, Oysters, Smelts, etc.—The shores of Prince Edward Island, New Brunswick and parts of Nova Scotia furnish oysters of unequalled flavor and comestible qualities. Owing to over-fishing and inadequate protection the yield has seriously declined from 70,000 or 80,000 barrels per annum to half that quantity, valued at about \$140,000 yearly. On the other hand, such an industry as the smelt fishery, mainly carried on through the ice in December, and the early months of the year, has grown from \$117,000 in 1881 to \$400,000 or \$500,000 in value. These dainty fish formerly used as fertilizing material on farm lands, are now shipped, four or five thousand tons per season, in a frozen condition, mainly to the United States markets. The estuaries of the Miramichi, Restigouche and other New Brunswick rivers are the centres of this remarkable fishery.

The sturgeon fishery has witnessed a great development recently, and has much greater possibilities before it. This fish became commercially valuable in Canada, first on the

Saint John River, N. B., in 1880, when 602,500 pounds were shipped to New York. In four years the catch fell to 126,000 pounds, and in 1895 barely 27,000 pounds were secured; but in Lake of the Woods, and on the Great Lakes, and above all, in the illimitable waters of Manitoba, the Northwest, and British Columbia, the sturgeon fishery has received a great impetus during the last five or six years. In 1902 the yield of sturgeon was valued at \$173,315, as compared with \$90,000 20 years ago. Canada, in the opinion of some authorities, is now one of the chief producers of "caviare," which formerly brought 10 cents to 15 cents per pound, and now sells in the cleaned, partly prepared condition at 90 cents to \$1 per pound. Catfish and similar species, as well as eels and coarse fish generally, formerly little valued, are now in demand, bringing to the fishermen from \$750,000 to \$1,000,000 per annum.

Fishing Bounty.—For the encouragement of the Atlantic deep-sea fisheries a bounty system is carried out, the fund for which (\$4,490,882) was provided by the Halifax Award, 1877. The bounties paid annually to vessel owners, vessel-fishermen, and boat-fishermen, amount to about \$160,000.

Government Hatcheries.—An important adjunct to the natural reproduction of fish, aided by close seasons, size limits, etc., is the artificial culture of fish under the Dominion commissioner of fisheries. Twenty-two hatcheries are in operation, and four or five are in course of erection. The output of fry in 1903, amounted to 314,511,500, including Atlantic and Pacific salmon, lake trout, brook trout, whitefish, pickerel or doré, lobsters, etc. The total number of young fish planted in Canada during the last 30 years is no less than 3,704,546,000. Several of the Provincial Governments (Ontario, New Brunswick, and British Columbia) also aid in fish-culture to a limited extent.

Scientific Stations.—Two scientific biological stations are maintained by the government for the study and solution of fishery problems. The Canadian Marine Station, founded in 1898, can be floated from one part of the coast to another, and the staff have been engaged in the investigations of marine life at St. Andrews, N. B., Canso, N. S., and Malpeque, Prince Edward Island. It publishes, at intervals, a scientific bulletin. The Georgian Bay Station, Lake Huron, confines its work to the fisheries of the inland waters. The staff at both institutions, consists of professors and specialists from the Canadian universities.

Bait Freezers, Guano Works, etc.—In the fall of 1900 the Canadian government inaugurated a system of State-aided bait freezers in order to meet the needs of the fishermen, who have suffered much from irregular supplies of bait. Local fishermen's associations can, under conditions, secure a government grant covering half the cost of construction, and an annual payment of \$5 per ton for bait preserved in the State-aided freezers. Twenty-four of these buildings have been built, varying in capacity from 10 tons to 50 tons. Larger freezers, to supply the Canadian "banking" fleets, are included in the scheme, one at Canso, costing \$50,000, having a capacity of 2,000 tons. Government fish-dryers

CANADA — MANUFACTURES

are also at work aiding the fishermen in preparing their products for the market independently of unfavorable weather. The initial drier was erected at Souris, Prince Edward Island. Further the government have imported Scottish experts, and a staff of Highland girls, to cure herring on the most approved methods. The scheme has proved most successful, and the Canadian fishermen receive instruction, and are enabled to improve the quality of cured herring sent into the markets. The incursions of hordes of destructive dog-fish and the injury to the fisheries resulting from the dumping of fish-offal, etc., in the sea, have moved the government to start fish-waste reduction works at various localities on the coast. These works conducted on the most approved methods, purchase dogfish, cod-heads, etc., from the fishermen, and convert them into guano, fish-oil, etc., under qualified government management.

Fishery Cruisers.—The Fisheries Protection fleet of about a dozen vessels, including a number of armed cruisers under trained naval officers, patrol the sea-coast and the Great Lakes. They enforce the fishery laws, and are under the direction of the commander of the Fisheries Protection Service.

Central Administration.—For the administration of fishery affairs, a special government Department of Marine and Fisheries was created at Confederation (1867) under a minister of the crown, and aided by a large staff of officials (inside and outside service) at Ottawa. A deputy minister, a commissioner of fisheries, about 20 inspectors, and numerous lesser officials carry out the duty of regulation which falls to the Federal authorities. The Dominion expenditure on fisheries approaches \$600,000 per annum. Up to 1898, the Dominion government exercised sole administration; but by a recent judgment of the Imperial Privy Council (London, June 1898) it was decided that most of the Provinces have "property" in the fisheries, and in them is vested the right of issuing licenses, collecting revenue, and enforcing fishery laws, while it falls to the Dominion to frame regulations, exercise jurisdiction and carry out a general supervision in the interests of the fisheries as a whole.

EDWARD E. PRINCE,

Dominion Commissioner of Fisheries.

Canada — Manufactures. Canada has become year by year increasingly important as a manufacturing country. In the vast agricultural wealth, the fish, timber, mineral and other resources, her industries have a sure foundation, while the practically unlimited supply of water-power, supplemented by extensive coal areas, have combined with an increasing home and export trade to give manufacturing a development which has been phenomenal.

The grain produced forms the basis of a large milling industry. Much Canadian wheat is shipped direct to Europe, but in addition nearly 6,000,000 bushels are ground yearly in Canada and exported. In 1903, 1,228,000 barrels of flour, 145,000 barrels of oatmeal, and 11,251 barrels of other meal were exported. Other mills manufacture cereal foods. Co-operative butter factories or creameries have become a most important manufacturing industry among the farmers, the factory method of manufacture having, for trade purposes, entirely superseded the home method. In 1903 Canada exported

229,100,000 pounds of cheese and 34,128,944 pounds of butter. Pork-packing (including bacon, ham, and pork) is an important industry which is rapidly developing. In 1903 the exports of pork aggregated 143,288,402 pounds. Beef and mutton are also the basis of important dressed meat enterprises. The raw material of flour and grist mills, butter and cheese factories, meat-packing and slaughtering establishments is almost wholly of the products of agriculture. Their aggregate value in 1901 was \$71,173,295.

Exports of canned meat, fruit, and vegetables have increased rapidly in value from year to year, totaling in 1903 more than \$6,000,000, as compared, for example, with a total of \$3,700,000 10 years previous. The tanning industry, the manufacture of boots, shoes, harness, saddlery, and leather goods are all enterprises more or less directly concerned with the products of the farm, which have shown steady and increasing development.

Connected with the fisheries is the fish-canning industry, a most important one, in which alone it is estimated that 80,000 men and a capital of \$11,000,000 are employed. The fish are smoked, canned, or pickled for export, or shipped in cold storage to Canadian cities, the United States, and the West Indies. The exports for 1902 of the salmon canning industry on the Pacific coast aggregated over 49,000,000 pounds. Lobster canning is a considerable industry on the Atlantic coast.

Lumbering has always been an important industry in Canada. The total value of lumber exports in 1903 was \$36,386,015. Canadian forests are looked upon as a great source of supply of pulp wood, and several mills have in recent years been put in operation for the purpose of converting spruce into pulp wood. The manufacture of furniture, vehicles, matches, and other wood products besides paper, is making rapid progress. The following estimates of the raw material in the several provinces may serve to indicate the basis for future development of this important industry: In 1900 there were in the province of Nova Scotia about 75,000,000 acres of ungranted crown lands covered with forest; in New Brunswick about 12,000 square miles of forest in possession of the crown, of which over 9,000 square miles are under license to lumbermen. In the province of Quebec, standing timber, exclusive of pulp wood and undersized trees, would produce at least 60,000,000,000 feet of lumber. The northern portion of Manitoba and the Northwest Territories is covered with a sub-arctic forest, and the forests of British Columbia probably cover about 1,500,000 acres. Ontario contains the greatest variety of useful trees, and the greatest number of industries depending upon wood of all of the provinces.

Manufacturing based upon the mineral resources of the Dominion has been of a later development than manufacturing in other lines, but promises to become increasingly important. The bituminous coal of Nova Scotia is well adapted to the manufacture of gas and coke. All varieties of iron ore are found in that province, and are being extensively developed. Asbestos is an important mineral in the province of Quebec. Copper, iron, and mica are also extensively produced. Nickel is the most important mineral in Ontario. In 1903 its production was 6,999 tons, valued at \$2,499,681. In the prov-

CANADA — MANUFACTURES

ince of Ontario during the same year there were mined 208,154 tons of iron ore, and there were produced 87,400 tons of pig iron and 15,229 tons of steel. The total mineral production of the province for the year amounted to \$12,870,931, including the non-metallic minerals, the chief of which were common brick to the value of \$15,615,700, petroleum to the value of \$1,586,674, and Portland cement to the value of \$1,182,979. British Columbia is particularly rich in minerals, the chief of which are gold, silver, copper, and lead. While manufacturing has not developed to any considerable extent in the province of British Columbia, a very great development may be expected. A large amount of capital has been invested at Sydney, N. S., and at Sault Ste Marie, on Lake Superior in Ontario, in the iron and steel industry. There are also important rolling mills and foundries; and special lines of machinery are largely manufactured in different parts of Canada, especially in the province of Ontario. Among other important industries in the Dominion are cotton and woolen mills, tobacco factories, sugar and petroleum refineries, breweries, and distilleries.

The water-power of Canada is not equaled by that of any other country, and its presence is attracting much capital for manufacturing purposes to the Dominion. Some of the largest industries are being operated by water power. In Sault Ste. Marie the largest pulp mill in Canada and a number of important industries are operated by electricity, developed by the local rapids, 175,000 horse-power having been developed thus far. It is reported that Winnipeg, which is 100 miles west of Rat Portage, with its industries, as well as other places, will be supplied with power from a dam across the Winnipeg River at Rat Portage, with a capacity of about 30,000 horse-power. At Niagara Falls extensive power companies and many large chemical industries have been established, with an aggregate capital of about \$20,000,000, the horse-power to be developed at this point to be 424,000. Large electrical works have also been constructed at Lachine Rapids, above Montreal, and at Chambly, on the Richelieu River. These plants supply electricity for the operation of a street railway and for domestic and street lighting in Montreal. The streets of Quebec are lighted and the Quebec street railway operated by electricity developed at Shawinigan Falls on the river Saint Maurice. The Chaudiere at Ottawa, with a fall of about 40 feet at low water, has been used for many years for driving mills, pumping the city water supply, and generating electricity for light and operating the street railway, 8,000 horse-power being developed. Within a radius of 50 miles from Ottawa there is available water-power energy equivalent to 900,000 horse-power. These are only instances. It is estimated that the Saint Lawrence system places 10,000,000 horse-power at the disposal of Canadian industry.

The favorable conditions for skilled workmen in the manufacturing industry in Canada are reflected by the constant demand for labor which has been general for many years, the comparatively high rates of wages paid to workmen, and the reasonable length of the working day. The several trades are partially organized, their members belonging to unions having for the most part international affiliation with the unions in the United States. During 1903

it was estimated that there were between 1,500 and 1,600 local labor organizations in Canada. Unemployment on any noticeable scale has been practically unknown in the manufacturing industries in Canada since the industrial depression in the '70s, and at the rate at which manufacturing development has been proceeding, it is unlikely that the large demand for labor will cease for some time to come. On the other hand, the favorable condition of the labor market to employers is reflected by the comparatively small number of strikes and lockouts arising throughout the year, and the fact that in many industries, notwithstanding that wages have shown a tendency to increase, profits have been such as to attract a rapidly increasing amount of capital. During the three years 1901, 1902, and 1903, there was an average of only 130 strikes a year in all the trades and industries throughout the Dominion, and of this number only one half were connected with manufacturing establishments.

A comparison of the figures given in the returns of the census for the year 1901 (*) and the returns of previous censuses will indicate the great development which has taken place in manufacturing in Canada during recent years, as well as the nature of the chief manufactures.

It is estimated that in 1891(†) there were in manufacturing establishments employing five hands or over, in all, 272,033 employees. In 1901 this number had increased to 344,095. The amount paid in yearly wages in 1891 was \$79-234,311. In 1901 it had increased to \$113,283,146. According to the first Dominion census, which was taken in 1871, there were in that year employed altogether in manufacturing establishments in the Dominion 187,942 persons; the amount paid in wages was \$40,851,009. These figures would indicate that the total number of persons employed in manufacturing in Canada has almost doubled during the past 30 years, while the amount paid in wages has nearly trebled in the same time.

Equally interesting by way of comparison are the figures which show the total value of articles manufactured. According to the returns of 1891 the value of the articles manufactured in establishments employing five hands and over was \$368,696,723. This amount had increased to \$481,053,375 in 1901. Compared with the total value of articles manufactured in 1871, which is estimated at \$221,617,773, it will be seen that the total value of articles manufactured has more than doubled in 30 years.

According to the original figures of the census of 1891, in which account was taken of all kinds of manufactures, no matter how few persons were employed, the estimate given of the amount of capital invested in manufactures in Canada is \$354,620,750. In the census of 1901, which relates exclusively to establishments employing five hands or over, the estimated capital invested is placed at \$446,916,487. In the

*The figures made use of in these comparisons are taken from the tables of the 1901 Census, the compilation of which has just been completed. The figures have not, as yet, been published.

†The figures quoted for 1891 are the figures of the Census of that year as revised for comparison with the 1901 Census, a different basis of calculation having been employed in previous years. The Census of 1901 took account only of establishments employing 5 hands and over.

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

census of 1871 the amount of capital invested in manufactures is placed at \$77,964,020. A comparison between the years 1871 and 1901 indicate that the capital invested in manufactures in Canada has increased between five- and six-fold during the period of 30 years.

The following table gives the development during 10 years in the most important of Canada's industries:

Nova Scotia, were valued as a market for British goods and as a field for the furnishing of naval supplies, chiefly sailors, fish and timber. Nova Scotia's trade was almost entirely developed in connection with New England and the West Indies. Trade with French Canada was illegal, on both sides, and for the most part unprofitable, except for furs in exchange for British manufactures. It was but natural,

W. L. MACKENZIE KING,
Deputy Minister of Labor, Ottawa.

Canada — Commerce, Tariffs, and Transportation. In their earlier condition the various provinces of British North America, now forming the Dominion of Canada, were all alike subject to those general laws which embodied the principles, if not always the practice, of the British Colonial System. Owing, however, to variations in location, natural resources, and the character of the inhabitants, the commerce and tariffs of the various provinces were more or less adapted to their special conditions.

Before the conquest of Canada, the Maritime Provinces, under the general name of

therefore, that, after the conquest of Canada and the independence of the United States, Nova Scotia should still continue to trade chiefly with the New England States and the West Indies, and only to a limited extent with Canada.

Owing to their extensive coast line and numerous harbors, New Brunswick being also well supplied with river navigation, the question of transportation was long a simple one for the Maritime Provinces. For Canada, the Saint Lawrence and its tributaries had always furnished the great highway of the country. But above Montreal the river was greatly obstructed by rapids, hence the trade to the West was first developed along the easier Ottawa route, which passed by way of Lake Nipissing to the Georgian Bay. There it followed the sheltered northern channel and the Saint Mary River, with a portage at Sault Sainte Marie, up to Lake Superior, and on, by numerous lakes and streams, to the vast Indian country beyond.

The coming of the Loyalists, as the first

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

settlers in what is now the Province of Ontario, rendered necessary a regular traffic up the Saint Lawrence and along the lower lakes. From Montreal to Prescott and Kingston this traffic was carried on by means of various forms of large flat-bottomed boats, known as bateaux, which were towed up the rapids, later with the aid of horses. These bateaux brought up limited supplies of European imports, chiefly British goods, and took down the furs and, so far as their space would allow, the potash and flour of the Western settlements. The Revolutionary War had led to the building of the first British vessels on the Lakes. After the peace, several of these became trading vessels and others were built, the number steadily increasing with the growth of the Canadian and American settlements on either side of the Lakes. The presence of lake vessels diverted the greater part of the Indian trade from the northern to the southern route.

At first most of the surplus produce of the Western settlements found a ready local market in supplying the temporary needs of new settlers, and in furnishing provisions for the Indian posts and the British garrisons. With increasing crops, however, there soon arose a necessity for export, especially of such articles as wheat, flour, peas, salt meat, and various minor provisions. About the beginning of the 19th century the amount of provisions exported from western Canada was nearly equivalent to the amount purchased by the British Government for consumption at the garrisons and posts. In 1801 the total exports of Canada amounted to \$4,800,000. This growing trade required a more extensive and economical means of conveyance than that afforded by the bateaux. A trade in staves and various forms of timber having developed about the same time, and being sent to market in the shape of rafts, these were utilized to convey such provisions as might suffer a little exposure. Large square scows were also built for the purpose of taking provisions to market in bulk.

As regards tariffs and trade regulations in the earlier Colonial period, nothing was left to the Provincial authorities; all was regulated by British statutes and administered by imperial officers. In the matter of taxation, after the American Revolution the British North American colonies had little to complain of, for instead of being taxed to assist Britain the British people were taxed to assist the colonies. In return for her freedom to determine the commercial policy of the colonies and to appoint their officials, Britain had to meet their deficits, besides furnishing the whole of the naval and military services.

The first important change in colonial commercial relations resulted from the recognition of the independence of the United States in 1783. Pitt and Shelburne had desired to continue practically the same commercial relations with the late colonies after the separation as had existed before it, considering that political independence did not alter the value of a profitable mutual trade. Technically, however, such a policy would do violence to the whole commercial and colonial system, including the Navigation Acts,—the system of "ships, colonies and commerce," upon which the whole British empire was supposed to rest—and this could not be permitted.

Canadians were for a long time too completely absorbed in questions connected with the control of their internal affairs to be much concerned with the fiscal policy of the country. Indeed they rather looked upon Britain's control of the fiscal policy as a means of obtaining increasing assistance from the mother country. The earlier tariffs were simple affairs, the revenue was derived chiefly from duties on spirituous liquors and the molasses from which rum was distilled. The sweeping prohibitions of the Navigation Acts simplified matters very much. There was no trouble with foreign European goods, because they were forbidden to be admitted to the colonies even in British ships, except when they had passed through British ports. It was in Britain, therefore, that the tariff dealt with them and qualified them for entrance to the colonies. In the matter of spirits and such things as were dealt with in colonial tariffs, a variety of preferential duties favored the more as against the less direct trade with Britain and the colonies. After the granting of representative legislatures in the colonies (1791 in Canada) they were permitted to impose customs duties on imports, for revenue purposes only. The right of disallowance exercised by the Crown prevented any unfavorable treatment of British goods.

By the Act of 1778 the British Parliament maintained and freely exercised the right to regulate, by tariff or other restrictions, the commerce of the colonies, but explicitly stated that all revenue incidentally obtained, after paying the expenses of its collection, should go to the treasury of the colony in which it was collected. There was thus a double jurisdiction in the matter of tariffs, the Imperial and the Colonial. But, so far as the colonial and imperial tariffs covered the same ground, only the colonial tariff was enforced. The imperial tariff applied only where its rate of duty exceeded that of the colonial. The colonial tariff was practically only for revenue purposes; the imperial tariff was entirely for the regulation of commerce in the interests of imperial trade.

The first legally recognized trade between the United States and Canada was provided for in the Quebec Ordinances of 1787-8, which permitted the free export of all goods except furs and peltries, and the import of all forms of timber and naval stores, all kinds of grain and other natural products, and settlers' effects. Rum, spirits and manufactured goods were entirely prohibited, but in 1790 pig iron was added to the list of permissible imports. Pitt's commercial treaty with the United States in 1794 greatly promoted trade between the British American provinces and that country. In this he partly realized his earlier idea of permitting a free mutual trade in all ordinary goods between the United States and the British colonies. But, in deference to the Navigation Acts, so far as the trade was conducted by sea it must be in British ships. A direct trade to the East Indies was also permitted to the United States, and later this led to several important relaxations of the British colonial policy.

The Canadian merchants at such western points as Kingston and Queenston (Niagara), sent their orders for British goods to their Montreal correspondents, who imported them from London, guaranteeing payment there, and forwarded them to the western centres, whence

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

they were distributed to the local dealers in Canada and the United States. The same agents were employed in collecting and forwarding the western produce, consisting of grain, provisions, potash and staves, as well as some of the cash which the original settlers had carried with them to meet their first wants. By these means payments to the Montreal merchants were partly made, the balance being met chiefly by commissariat and other bills of the British Government, for supplies and salaries.

The United States was the first to interfere with the freedom of this trade, duties being imposed in 1801 in the interest of eastern American traders. However, custom houses did not flourish in the wilderness, and for many years trade with the United States was not greatly hampered by tariffs. In 1805 duties were imposed, in Lower Canada, on certain goods coming from the United States, but in practice this applied to the Lake Champlain route only.

The trade relations of the Maritime Provinces, as we have seen, were well established before the United States secured its independence, but, while the United States enjoyed great freedom of trade with all countries, the Maritime Provinces still remained under the close restrictions of the Navigation Acts and the Colonial System. Thus general merchandise, even British and East Indian goods, was cheaper in the United States than in the British American ports. As a natural result there was extensive smuggling along the coasts of Nova Scotia and New Brunswick, and especially among the islands of Passamaquoddy Bay. American vessels supplied the colonists with liquor, tea, tobacco, molasses and other East and West Indian produce, and the chief lines of European and American goods, and received in return furs, fish, lumber, grain, etc., which they carried to their own ports and to the West Indies. Thus the restrictions designed to give Britain a monopoly of the colonial trade and shipping worked to the opposite purpose. Plainly the system had either to be given up or enforced by quite drastic measures. On the death of Pitt the latter policy was adopted, beginning with the Orders in Council, which in turn induced the non-intercourse policy of the United States, and ultimately the war of 1812-15.

While disastrous to the West Indies and most injurious to great Britain, yet the troubles between Britain and the United States were immensely profitable, for the time being, to the British North American colonies. To insure the carrying of the West Indian supplies in British ships, American produce was collected in ports of the Maritime Provinces and in Canada, where it might be taken by sea in either American or British vessels, by overland transport, or by inland navigation. This stimulated the trade and shipping of the Canadian and Maritime Provinces and enriched the colonial produce dealers. The ultimate benefit, however, of these and later abnormal conditions was more than doubtful. After the Peace of 1815, Canada suffered a severe reaction, emphasized by an unfortunate land and emigration policy.

The enormous preference in the British market on British North American timber, which had been built up during the Napoleonic wars, was retained and developed because it enriched British shipowners and timber merchants.

By the new Corn Law of 1815 a preference was granted to Canadian grain, but it was very uncertain in its operation, since the grain was not admitted at all until the price had risen to quite a high level, in the case of wheat to about \$2.10 a bushel.

The international restrictions necessary to preserve a fair equality for British shipping, under the disadvantages of her Colonial System, involved further trouble with the United States. Britain admitted a reciprocal shipping trade between the home country and the United States, and between her colonial possessions and the United States in the inland waters of North America, but denied corresponding reciprocity by sea between the United States and her American colonial possessions. In 1818 the United States retaliated, and direct trade with the West Indies was again suspended. Halifax in Nova Scotia and Saint John in New Brunswick, were then made free ports for American vessels bringing certain lines of goods necessary for the supply of the West Indies. In 1823 American vessels were admitted to the colonial trade generally for all direct dealings between the United States and the colonies. Once more the trade of the Saint Lawrence languished, and complaints poured in upon the home government.

In 1825 Mr. Huskisson, who had revived the policy of Pitt, sought to promote freer trade in America. But he found it impossible as yet to grant perfect reciprocity in shipping. Differential duties were imposed in favor of British shipping in the trade between the United States and the West Indies. The Americans applied the same differentials on their side, and there resulted another period of non-intercourse, from 1826 to 1831, with corresponding activity and prosperity for the Saint Lawrence route and the British North American ports. By admitting to the colonies provisions from the northern nations of Europe in their own ships, Huskisson managed to prevent the Americans from forcing his hand. They came to terms in 1831 and normal trade was once more resumed. But by this time the Colonial System was badly shattered, and almost the only thing left of the Navigation Acts was the British monopoly of the domestic shipping of the empire. The way was being gradually prepared for the final stroke of colonial economic emancipation.

In 1825 Huskisson weakened the corn laws by greatly increasing the preference on Canadian wheat. Regardless of the local price, Canadian wheat was to be admitted at a uniform duty of five shillings per quarter. For a time the exports of wheat were greatly stimulated, but the benefit was not permanent, and the cry for additional preferences was soon resumed.

The prosperous period of 1826-31, augmented by large expenditures on Canadian public works and an increased emigration, continued for a couple of years after the resumption of normal relations with the United States. But trade depression and political troubles brought Canada to a very low ebb in 1837-8. In 1840 the two Canadian provinces were united, their political freedom was greatly enlarged, and trade revived.

In 1843, after urgent petitions, which more or less coincided with the rising demand in Britain for free food, Canada obtained the ominously liberal concession of access to the British market, at the nominal rate of one shilling per quarter, for all the flour she could

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

grind from her own, or imported American wheat, while the corn laws still stood against the rest of the world. Bad harvests and higher prices in Britain tended to enrich the Canadian merchants and millers, but precipitated the repeal of the corn laws, in 1846, and the adoption of a free trade policy generally.

Free trade carried with it important changes for Canadian commerce, tariffs, and transportation. The preference on Canadian grain had gone, and the preference on British North American timber soon followed. In 1847 Britain renounced the right to regulate Canadian trade, and in 1849, by the final repeal of the Navigation Acts, she gave up her monopoly of the domestic carrying trade of the empire. The general result was that the colonies were left to face the world on much the same terms as other countries. Though lacking in the experience which breeds prudence, those interests which had not been specially pampered entered upon their new career with much zest and enterprise, tending sometimes to rashness.

At this stage questions of transportation began to be of vital importance to Canada. After the war of 1812 attention had been directed to the necessity for improving the Saint Lawrence route between Montreal and the lakes. A canal to surmount the Lachine Rapids had long been talked of, even abortively attempted. Finally, in 1821, the work was seriously undertaken by the government of Lower Canada, and completed in 1825. This was the year of the opening of the Erie Canal, which, coming at the beginning of a decade of unusual expansion and prosperity for the lake regions, proved a phenomenal success, commercially and financially. This gave an immense impetus to canal building in Canada and the United States. Canals, instead of building public debts, were to abolish them and support States and provinces without taxation. See CANALS.

In 1824 the Welland Canal was undertaken by a joint stock company with a capital of only \$150,000, mostly subscribed in the United States. After many vicissitudes and appeals for both imperial and provincial assistance, it was opened for traffic in 1832. The locks were of wood, 100 x 22 feet with 7 feet of water. However, neither the Lachine nor the Welland Canal could be of much more than local importance until the remaining Saint Lawrence rapids were surmounted. This task the Imperial Government was prevailed upon to undertake. But, in doing so, it disregarded all commercial considerations and followed a short-sighted but very round-about military idea. The Rideau Canal was the result, extending from Kingston to Ottawa, which was afterward connected with Montreal by improvements of the Ottawa River navigation. The locks as constructed were 134 x 33 feet with 5 feet of water. It was opened in 1832 and cost the Imperial Government about \$4,000,000, or between six and seven times the original estimate. Though of necessity carrying considerable traffic, it soon proved that it was not to be a commercial success, since it could not compete with the Erie Canal and did not even supercede the bateaux on the Saint Lawrence. The Upper Canadian legislature determined to complete the Saint Lawrence system, and the Cornwall Canal was begun in 1834. But the financial crisis and political troubles of 1837 suspended operations.

The union of the provinces in 1841 brought with it an imperial guaranteed loan for \$7,500,000, with which to complete the public works already planned and partly undertaken. The Welland Canal was taken over by the government and reconstructed. The new locks were 150 x 45 feet, with 9 feet of water, afterward increased to 10½ feet. These were smaller than the locks of the Cornwall Canal, which were 200 x 45 with 9 feet of water. The latter was opened in 1843. The Beauharnois and Williamsburg canals completed the Saint Lawrence system. They were built on the same scale as the Cornwall Canal, and the last lock was opened in 1847. The completing of these canals necessitated the enlargement of the Lachine on the same scale, which was completed in 1848. Thus, in 1849, after the expenditure of upward of \$20,000,000, the new Canadian canal system was prepared to accommodate vessels drawing 9 feet of water, and Canada expected to realize her eagerly awaited control of the growing traffic of the great basin of the lakes.

But many changes in commerce and transportation had taken place between the opening of the Erie Canal and the opening of the Saint Lawrence system. The British protective and colonial system had been abandoned, and grain from the ports of the United States entered Britain as freely as from those of Canada. Moreover, railways were transforming the carrying trade, making time and continuous service essential features in commerce. While the Canadians were preparing their canals to capture the American carrying trade of the West, the American government was induced, in 1846, to establish the drawback or bonding system. This enabled the American railroads and other transportation companies to make a successful bid for a large share of the western Canadian carrying trade to Atlantic ports. Finally, though after 1849 western produce could be landed at Canadian seaports much more cheaply than at American ports, yet this advantage was lost through higher ocean freights and higher insurance from Canadian ports. The total suspension of shipping for half the year also discounted the natural advantages of the Canadian route, especially in competition with the railroads.

Nothing daunted, the Canadians with their new energy and self-reliance grappled with the changed conditions. On the one hand the government undertook the improvement of the navigation of the Saint Lawrence below Montreal, especially by deepening the channel of the river. The depth of 11½ feet at the time was increased to 18½ by 1860, and has since been increased to 27½ feet as far as Montreal. The navigation of the gulf was also improved.

About 1850 the ocean steamer was rapidly replacing the sailing vessel. The Cunard line of steamers, running to New York and Boston, was subsidized by the British government, doubtless a profitable venture for Britain, but appearing to Canadians as an additional handicap for the Saint Lawrence route. Canada was constrained to subsidize a line of its own,—the Allan—for weekly service, at an annual cost to the country of \$225,000.

The American boom in railroad building, starting from 1849, convinced the Canadians that they, too, must have railroads to supplement

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

their canals. They desired independent winter outlets on the Atlantic, and connection with American markets to which the attention of Canada was now turning. While absorbed in their canals the Canadians had given little practical attention to railroads. Hence, before 1840 only 16 miles of railroad had been built, connecting Montreal with Saint John's on the Champlain route to New York. Much discussion took place and many charters were obtained during the forties, but little of a serious nature was attempted. In 1849 the Canadian government, chiefly under the influence of Mr. (afterward Sir) Francis Hincks, adopted a vigorous railroad policy by undertaking to guarantee 6 per cent interest on a sum not to exceed half the cost of any railroad of not less than 70 miles in length. Among the first lines to be undertaken was the Saint Lawrence & Atlantic, connecting Montreal with Portland, and opened in 1853. In western Canada the Northern railway, from Toronto to Collingwood, was the first to be built, being begun in 1850 and opened in 1853. The Great Western railway, between Niagara and Detroit, was the next to be undertaken, and was opened in 1854. Under the fostering direction of Mr. Hincks, the Grand Trunk railroad was chartered in 1852, as the great central line of Canada. In 1853 it leased the Saint Lawrence & Atlantic, and when, in 1856, the main line was opened from Toronto to Montreal, the chief commercial districts of Canada were connected with the Atlantic by a Canadian line.

The railroad boom lasted from 1849 to 1857, involving an immense outlay of capital, chiefly British. Both the central government and the municipalities were deeply pledged in support of the numerous lines undertaken. The crisis of 1857 brought the movement to a close, and the pecuniary embarrassments of most of the lines effectively discouraged further railroad enterprises for the next 10 years. In Nova Scotia and New Brunswick large projects were also afoot to connect Halifax and Saint John with the New England States, and also with Canada. But, beyond small sections of these plans, chiefly for local traffic, little was accomplished before Confederation. The general situation is reflected in the following figures. In 1840 there were in the British North American Provinces 16 miles of railroad; in 1850, 66 miles; in 1860, 2,065 miles, and in 1870, 2,617 miles.

With regard to tariffs, the central feature of the period between 1850 and Confederation, in 1867, was the Reciprocity Treaty with the United States, signed in 1854 and abrogated in 1866. It established reciprocal free trade between the British North American Provinces and the United States, in all natural products. This secured free entry to the United States for practically everything which the British provinces had to sell. (See CANADA — RECIPROCITY WITH THE UNITED STATES.) The special attraction for the United States was the freedom of access to the Canadian fisheries (q.v.); though the Americans also enjoyed large local markets for agricultural products, in many parts of the eastern provinces. According to the statistics of trade, Canada appeared to have the best of the bargain. But the statistics require interpretation. Much of the Canadian export to the United States was really only a transit trade; either the same goods, or their equivalent,

being shipped from Atlantic ports. Again, between 1854 and 1858 the decline in the amount of manufactures imported from the United States was due to the financial crisis of 1857 and the cessation of public works in Canada. Then, during the Civil War the United States was extensively purchasing supplies, and had little to sell. The Canadians themselves have been greatly deceived by the figures of the reciprocity period, and have imagined that a like result would flow from the renewal of reciprocal trade.

The other feature of importance in this period was the increase in the Canadian tariff on manufactured goods, in 1858 and 1859. Owing to the large public debt contracted for the building of the canals, the interest on which was not offset by tolls as expected, and, more immediately, owing to the great obligations incurred in guaranteeing railroad investments, the Canadian government was in great financial straits after 1856 and was therefore forced to seek a larger revenue. Accordingly, in 1858 the tariff on imports was raised, the general rate being increased from about 12½ to 15 per cent, and in 1859 it was still further increased to 20 per cent. The British merchants and manufacturers vigorously protested against such an increase of duties on the goods of the Mother Country, and the manufacturers of the United States considered the increase of duties a breach of faith, inasmuch as they had expected their advantage from reciprocity to come from the sale of manufactured goods. The Canadian government replied that its sole object was to relieve its obligations, not to check imports.

The abrogation of the Reciprocity Treaty in 1866 produced a strong effect upon the British North American Provinces and undoubtedly precipitated Confederation. The Canadian tariff of 1866 was lowered to a 15 per cent standard, as a concession to the freer trade leanings of the Maritime Provinces, and became the first tariff of the Canadian Dominion. Canada retained the general principles of a tariff for revenue until, in common with other countries, she suffered from the world-wide depression of 1875-8. An effort was made to secure the renewal of the Reciprocity Treaty. This failed, however, and a change of government took place on a promise of relief by means of a protective tariff. This new tariff of 1879 raised the general standard of duties from 17½ to 20 per cent. Times revived throughout the world and the relief promised actually came. The tariff, however, did not prevent the country from suffering with all others during the next period of depression, from 1884 to 1886, though the tariff had been raised somewhat in the interval. Nor did the country escape during the next depression, from 1894-6, when another change of government took place after a general election. The Liberal party, being more or less pledged to a reduction of duties, found it more difficult to accomplish than to promise. In 1897, however, the tariff was considerably amended in the interest of the consumer, and the happy expedient was devised of offering to the world at large a reduction of 25 per cent on the general tariff, wherever Canada was treated with equal favor. As Britain was practically the only important country fulfilling these universal conditions, the policy which was entered upon as a redemption of the party pledge ended in the preferential treatment of

CANADA — FINANCIAL SYSTEM

British goods only. This limitation was explicitly recognized in 1900, when the preference on British imports was increased to 33⅓ per cent. Since, for various reasons, Canadian imports from Britain were declining, relatively at least, this concession did not adversely affect important Canadian industries except in the department of textiles. Accordingly in 1904 this part of the preferential tariff has been amended and the duties raised. At the same time a new principle of maximum and minimum tariffs has been outlined for the future.

As a condition of Confederation, in the East, the Intercolonial railway, connecting the Maritime Provinces with Canada, was constructed by the government at a cost of upward of \$20,000,000. A corresponding condition of western federation was the construction of a transcontinental line to British Columbia. This was ultimately realized in the Canadian Pacific railway, begun in 1881 and completed in 1885 at a cost to the country of \$62,000,000 in cash and 25,000,000 acres of land.

Confederation also directed attention to the renewed importance of the Saint Lawrence route and the economy of large vessels for the carrying trade. It was determined to enlarge and deepen the canal system. The new movement was once more begun at Cornwall, in 1876. The dimensions of the new locks were 270 x 45 feet with 14 feet of water. The other canals were enlarged or quite new ones constructed on at least the same scale. The Soulanges Canal, the last to be built, has locks of 280 x 45 feet with 15 feet of water. In 1895 a Canadian canal at Sault Ste. Marie was opened with one lock of 900 x 60 feet and with 20 feet of water. There is now, therefore, a continuous waterway with a minimum depth of 14 feet from Lake Superior to the sea. It is not yet possible to say what the full effect of this will be on the carrying trade of the lakes, but much more grain is already following the Saint Lawrence route.

Meantime, railroads have been steadily expanding into the newer regions of the West and North, for now, as a rule, the railroad precedes regular settlement. The tendency to multiply independent lines, in steam railroads at least, has almost ceased, while the smaller roads are being consolidated into a few large systems, of which the Canadian Pacific railway and the Grand Trunk railway are the chief. Following modern American developments the railroad companies show a tendency to acquire lines of steamships connecting with their ocean terminals, the Canadian Pacific railway being the pioneer in this respect. Since 1870 the mileage of the railroads has increased as follows: 1870, 2,617; 1880, 6,858; 1890, 13,151; 1900, 17,657; and in 1904 nearly 19,000 miles. In the near future the mileage will be greatly increased, since the Dominion government has entered into an agreement with the Grand Trunk Pacific Company to construct another transcontinental line. This will extend from Monckton, N. B., through Quebec to Winnipeg, by a more northerly route than that of the present lines, and on, by the Saskatchewan Valley and Edmonton, through Northern British Columbia to the Pacific. This will involve new branch and connecting lines. Already, Canada as a nation has spent about \$80,000,000 on her canals and has contributed, in construction and subsidies for railroads, \$178,-

022,186 of Dominion money, while the provincial governments and municipalities have aided to the extent of \$36,554,792, and \$18,662,897, respectively.

That Canada has now begun to reap the benefit of these large outlays, which constitute the bulk of her national debt, is evident. For five or six years after Confederation, Canadian trade rapidly expanded, rising from \$131,027,000 in 1868 to \$217,801,000 in 1873. But it did not attain to these dimensions again before 1890. After rising and falling somewhat until 1896, it began to rapidly expand and in 1903 had risen to \$467,004,685, having more than doubled in eight years.

The most noteworthy feature of Canadian foreign trade is that it has always been confined chiefly to two countries, Great Britain and the United States. Canada exports chiefly to Great Britain and imports chiefly from the United States. However, the expansion of exports to Britain is to some extent due directly or indirectly to the expansion of imports from the United States. In 1902, of the total imports, 58.4 per cent came from the United States and 24.9 per cent from Great Britain, leaving only 16.6 per cent to be obtained from all other countries, within or without the British Empire. Of the exports, 33.1 per cent went to the United States and 55.8 per cent went to Great Britain, leaving only 11 per cent for all other countries. Of the free imports to Canada, over 70 per cent come from the United States, while, taking one year with another, nearly one half of the whole imports from the United States are free goods. Practically all of the free goods from the United States are essential to Canadian trade and industry. But a very considerable proportion of the dutiable goods from the United States are likewise employed as raw materials or instruments in Canadian industry. As Britain and the United States are the chief markets for the most rapidly expanding sections of Canadian industry — agricultural and mineral — there is no immediate prospect of a change in the direction of the main volume of Canadian trade. See CANADA — AGRICULTURE OF; CANADA — FISHERIES OF; CANADA — LUMBER INDUSTRY; CANADA — MANUFACTURES OF.

ADAM SHORTT,
Professor of Economics and Politics, Queen's University, Kingston.

Canada — Financial System. The first banking establishment in Canada was a private bank founded in Montreal in 1792, under the name of the Canada Banking Company, and evidently intended to be modeled after the English private banks. It opened for business and issued notes, but its life was very short. In 1807-8 an unsuccessful attempt was made to obtain from the Legislature of Lower Canada a charter for the Bank of Canada, which would have been a semi-government bank, resembling in many respects the first Bank of the United States, though naturally on a much smaller scale. In 1817 the "Montreal Bank" began business in Montreal as a private partnership, this being the origin of the Bank of Montreal, which was for many years, and still in some respects remains, the most important bank on the continent, while from its "Articles of Association" there has been developed, with steady continuity, the scientific system of banking law which exists in Canada to-day. In the

CANADA—FINANCIAL SYSTEM

following year two similar associations—the Quebec Bank and the Bank of Canada—were formed, on almost identical lines, and in 1822 all three obtained legislative Charters of Incorporation, valid for ten years, which followed the Articles of Association in almost every important particular. They differed very considerably, however, from the abortive bill of 1808. Framed to give legal recognition to associations of merchants already actively engaged in commercial banking, they were throughout designed to meet ordinary commercial requirements, and although they are perhaps more remarkable for what they omitted than for what they included, most of their provisions were sound. They confined the bank's business to legitimate lines, they prohibited lending upon pledge of goods or upon mortgage, or dealing in real estate, and they provided that all notes issued were to be redeemable on demand in specie. Power to open branches was not expressly given, but as it was not denied, its existence was assumed, and the banks did, as a matter of fact, open branches or agencies in both Lower and Upper Canada. The English private banks and the Scottish chartered banks were the joint parents of these Lower Canadian charters, and of the Canadian banking system which has sprung from them, but various changes and additions were made to suit Canadian requirements. In the phraseology used, as well as in some of the internal regulations, the influence of the chartered banks in the United States may be seen, but it may safely be said that practically everything which has proved of permanent value was derived from English, Scotch or native sources.

In Upper Canada the earliest banking legislation was on political, rather than commercial lines, and the first charter, that of the Bank of Upper Canada, granted in 1821-2, followed the Lower Canadian bill of 1808 rather than the Articles of Association of the "Montreal Bank." The plan as first adopted was not sound, and as it had little permanent influence upon later legislation no description of it is necessary. The Imperial authorities, by pressure persistently exerted, succeeded in securing the adoption of two important amendments which are still part of Canadian banking law. In 1832 banks were prohibited from holding, or lending on, their own stock, while in the charter of the Gore Bank, granted in 1835, it was provided that the shareholders should be individually liable for the debts of the bank to an amount equal to their respective holdings of subscribed stock. The prohibition of the lending of money on mortgage, which from the first had been embodied in Lower Canadian charters, was never adopted in Upper Canada, although strongly urged by the Colonial office.

The Union of the two Canadas took place in 1840, and at its first session in 1841 the legislature of the Province of Canada adopted the report of a Select Committee, favoring a uniform system of banking, and approving a number of important regulations emanating from the Colonial Office, some of which already existed in individual charters. All notes were to be payable on demand in specie, they were not to be issued to an amount exceeding the bank's paid up capital, and suspension of specie payments for a given number of days (not in any case exceeding sixty) either consecutively, or at

intervals within any one year, was to forfeit the charter. The bank was not to hold its own stock, or to make advances against it, nor was it to lend money on security of lands or houses, or ships, or on pledge of merchandise. These and a few less important regulations were incorporated in every new and renewal bank charter thereafter granted, the double liability clause was made applicable to every bank, and one bank was prohibited from holding stock in another, except such as might be taken for *bona fide* debts, contracted in the usual course of business. In this Act we have the first attempt to deal with banking in a systematic way and to lay down general rules to which all banks must conform.

Only a passing mention need be made of the free banking law which, avowedly an imitation of the free banking laws of the State of New York, was passed in 1850. By 1854 its failure was evident, the free banks gradually died out or obtained charters, and the Act was repealed in 1866. The only vestige of it now to be found is the provision, revived in the Dominion Act of 1880, that notes issued by a bank should be the first charge upon its assets.

Up to 1859 banks had been prohibited from lending money upon the pledge of goods, but in that year an Act was passed authorizing a bank to take bills of lading, warehouse receipts, etc., as collateral security for the payment of any bill or note discounted by it, providing the security was taken at the time the bill was negotiated.

Little need be said as to the banking history of the other Provinces. The charters in the Maritime Provinces were very similar to those of Lower Canada, Manitoba had no existence as a Province before it joined the Confederation, while British Columbia had passed no banking legislation, its only bank having been incorporated under an Imperial charter, which has now been surrendered.

Ever since Confederation in 1867, all right to legislate regarding banking has been vested in the Federal Government. The first important act passed after that date was that of 1871, which embodied all the provisions of any charter or general act then in force which it seemed desirable to perpetuate, making them applicable immediately to all new banks, and to all the then existing banks as soon as their respective charters expired. A few small banks in the Maritime Provinces continued for several years under their old charters, the last one coming under the operation of the Act on 1 March 1892. While each bank retained the necessarily individual features of its own charter—those relating to its name, capital, chief place of business, etc.,—and while it still remained necessary for every new bank to obtain a special act of incorporation (which it could do as a matter of course during any session of Parliament, if it conformed to the prescribed conditions) the new Act made all other regulations uniform, with some unimportant exceptions in the case of the Bank of British North America, which was incorporated under an Imperial charter, and La Banque du Peuple, which has since passed out of existence. Except for fixing a minimum subscribed and paid up capital for every new bank, and for the express right given to a bank to make advances on the stock of other banks (a most objection-

CANADA — FINANCIAL SYSTEM

able enactment, repealed in 1879) no new features which call for extended notice were introduced. It provided that no bank obtaining a new or renewal charter should issue notes of less than \$4 each, and that every bank should

bankers in Canada, and their operations are on quite a small scale.

The following tables give the principal items in the combined balance sheets of the banks at different dates since Confederation:

(ooo omitted)					Liabilities (ooo omitted)				Assets (ooo omitted)			
Dec. 31	No. of banks	No. of (a) br'ch's	Paid up capital	Surp's	Av'r'ge capital per b'k	Notes issued	Deposits	Total Li- abilities	Specie & Do- minion notes	Securit's	Loans & disc'n'ts	Total Assets

(c) Eight other small banks not reporting.

(d) Two other small banks not reporting.

(e) Government securities only.

(g) Exact figures not available.

The dividends paid vary from 5 to 12 per cent, the average rate being about eight.

hold as nearly as practicable one-half, and never less than one-third, of its cash reserves in Dominion notes, but the importance of the Act rests on the fact that it established the uniformity of the banking system which now prevails throughout the length and breadth of Canada.

Space will not permit of the subsequent development being traced in detail; it may be noted, however, that in 1900 a charter was given to "The Canadian Bankers' Association," a voluntary association of which practically all the chartered banks were members. It was now incorporated, and given certain definite legal duties and powers. For the rest, it must suffice to describe the Canadian banking system as it now exists.

The Bank Act is really the charter of every bank; the Bank of Montreal with a paid up capital and surplus of \$24,000,000, and the Saint Stephen's Bank, which has a paid up capital and surplus of only \$245,000, have exactly similar rights, privileges and limitations. The present practice is to enact the Bank Act for ten years only, and in this way a periodical discussion of the whole theory and practice of banking is ensured. During the intervals, the banks, as a rule, have peace.

The minimum subscribed capital necessary before a new bank can begin business is \$500,000, of which \$250,000 must be actually paid up in cash. Those banks which are on a smaller scale were in existence before 1890, at which date the minimum of paid up capital was raised from \$100,000 to \$250,000. After the bank is in operation the shareholders may, by passing a by-law at a general meeting, and afterward obtaining the approval of the Treasury Board, increase or reduce the capital stock, but it must not be reduced below \$250,000. Before a bank may begin business, it must obtain from the Treasury Board a certificate that it has complied with all the requirements of the law. The Treasury Board is the financial committee of the Privy Council for Canada. No person or corporation may assume the title "bank," "banking company," "banking house," "banking association," or "banking institution" without being authorized to do so by the Bank Act or by some other Act. There are now very few private

The chief place of business of most of the banks is at either Montreal (q.v.), or Toronto (q.v.). The right to establish branches is specifically granted, and while two or three of the banks have not availed themselves of this right, most of them have numerous branches, several being represented in nearly every Canadian town of any importance. Two or three have branches or agencies in London and in some of the more important cities in the United States, as well as in Newfoundland and the West Indies. Those represented in New York are among the largest dealers in foreign exchange there. Each bank is administered by directors, not less than five nor more than ten in number, who are elected annually by the shareholders, each share carrying one vote. Directors must each hold paid up stock of from three to five thousand dollars, according to the total amount of the capital stock; the majority of them must be British subjects. A general meeting of shareholders must be held annually, at which the directors must submit a clear and full statement of the affairs of the bank. Detailed statements must be sent monthly to the Minister of Finance, by whom they are published in the "Canada Gazette." The Minister of Finance has power to call for special information from any bank. No system prevails either of audit by the shareholders or of examination by the Government, but the banks make a practice of having all their branches and departments inspected at least once a year by their own inspectors.

In the United States the bank's president is generally its chief executive officer, but in Canada this is not the case. British precedent is followed, and the bank is managed by a general manager, who accepts the fullest responsibility for the conduct of its business. The Board of Directors deliberate on all important transactions and all applications for large credits which have been approved by the general manager are submitted to them. The branch managers are responsible for the general business of their respective branches, and, as a rule, are allowed to use their own discretion in making advances up to certain amounts, varying according to the importance of the particular

CANADA — FINANCIAL SYSTEM

branch. Any loans applied for in excess of the limit fixed must be referred to the General Management at the Head Office.

By means of the branch system credit is distributed throughout the whole country; money borrowed from depositors in the rich but less progressive portions of Ontario may be lent out again in the newest parts of the Northwest, and interest tends toward a common level. The *average* rate obtained in Manitoba and the Northwest is only about 1 per cent more than in Ontario. The banks being large, and under no restrictions as to the amount which they may lend to any one customer, are able to supply the total needs of any person with whom they are willing to do business. They grant yearly credits, and practically undertake to supply their customers' wants up to the limit fixed at any time during the continuance of the credit. As a corollary to this they usually require that each customer shall borrow from only one bank.

No special percentage of cash reserves is required to be kept—in fact, the banks are not required by law to keep any cash or other reserves—but of whatever cash reserves are kept, at least 40 per cent must be in Dominion notes. Percentages of cash reserves to total liabilities to the public held by all banks on 31 December in each of the last five years are as follows:

(000 omitted)

YEAR	Specie	Domin'n Notes	Total	Perc'tage to liabilities to public
1903.....	\$16,101	\$30,941	\$47,042	9.32
1902.....	12,892	24,730	37,622	7.87
1901.....	11,571	21,405	32,976	7.68
1900.....	11,773	19,785	31,558	8.38
1899.....	9,584	17,910	27,494	8.42

It must not be forgotten that the banks' cash reserves are only their first line of defense. Their real reserves are in the shape of call loans in New York against stocks and bonds, balances in the hands of their correspondents, and securities lodged with their agents in London and elsewhere, against which they are entitled to draw at any moment. New York and London are the final settlement points, and it is there that real strength is most necessary and most effective.

Clearing Houses exist at Montreal, Toronto, Halifax, St. John, Winnipeg, Vancouver, Victoria, Quebec, Ottawa, London (Ontario), and Hamilton. By local custom settlement of balances at the eight places first mentioned is made in Dominion notes; at the other points by drafts on Montreal or Toronto.

The total clearings during the last five years have been as follows: 1903, \$2,690,000,000; 1902, \$2,540,000,000; 1901, \$1,871,000,000; 1900; \$1,590,000,000; 1899, \$1,626,000,000.

The bank may issue and re-issue notes of \$5 and multiples thereof, but the total amount in circulation at any one time must not exceed its paid up capital. These notes must be redeemed in specie or Dominion notes on demand at the place of issue, and they must be accepted in payment at par at any office of the bank. Arrangements must be made under which they will circulate at par in every part of the country, and for this purpose the bank must establish

agencies for their redemption and payment at Halifax, St. John, Charlottetown, Montreal, Toronto, Winnipeg and Victoria, and at such other places as are from time to time designated by the Treasury Board. The right to issue notes intended for circulation is confined to the chartered banks. Very heavy fines are imposed in the case of over-issue, these fines varying from the amount of the excess circulation, if the excess is under \$1,000, up to \$100,000, if the excess should be \$200,000 or over. The notes issued by a bank are a first charge upon all its assets, but they are not specially secured by a deposit of bonds or cash, except by the "Bank Circulation Redemption Fund," to which all the banks have contributed 5 per cent on their average circulation, and which is held by the Government for the purpose of redeeming with interest at 5 per cent any notes of a suspended bank which the bank or its liquidator is not ready to redeem within two months after the date of suspension. The result of this is that the other banks readily accept at par the notes of a suspended bank, the notes remaining in their hands earning interest at 5 per cent until they are redeemed. As the banks are obliged to replenish the Redemption Fund gradually if it ever becomes depleted, they are all practically guaranteeing the notes of each. The amount at credit of this fund on 30 April 1904 was \$3,130,844, bearing interest at 3 per cent. No call has yet been made on it. The Canadian Bankers' Association has power to supervise and control all details connected with the issue of notes.

The bank's unissued notes cost it nothing, except for paper and printing, and it is thus enabled to keep at each of its branches a sufficient supply of currency for ordinary requirements, without any loss of interest except on a trifling amount of change-making currency. This has an important bearing upon the cost of establishing and conducting small branches. As the note issue is a source of profit, each bank pays out only its own notes and sends in for redemption the notes of other banks which it receives. Daily exchanges are made at every point where two or more banks are represented, each bank sending in to the other all the notes issued by the other bank which it received the previous day. The resulting balances are settled at the smaller places by drafts on the Clearing House centres. In this way an automatically elastic currency is obtained, and the banks are enabled, up to the extreme limit of their issuing power, to meet the annual demand for currency to "move the crops"—a demand which in an agricultural country like Canada is very urgent—while at the same time the daily redemption provides that the extra supply of notes will be forced out of circulation as soon as the need for them has passed. The elasticity of the note issue is shown by the following table:

TOTAL NOTE ISSUE OF THE CHARTERED BANKS.

YEAR	Lowest point reached Amount (000 omitted)	Date	Highest point reached Amount (000 omitted)	Date	Percentage of increase
1903....	\$55,040	January	\$70,480	October	28.05
1902....	48,586	January	65,928	October	35.69
1901....	45,025	January	57,954	October	28.71
1900....	41,320	January	53,108	October	28.75
1899....	36,916	January	49,588	October	34.33

CANADA — FINANCIAL SYSTEM

The merits of the Canadian bank note may be thus summed up: First, it is safe; nothing but national insolvency could make its ultimate redemption doubtful. Second, it is redeemable on demand in specie or Dominion notes; if suspension of payment occurs, the note bears interest at 5 per cent. until it is redeemed, and if not redeemed by the bank within two months, it will be paid out of the Redemption Fund. Third, it passes at par from one end of Canada to the other. Fourth, the amount in circulation is always the exact amount demanded by the industrial activity of the country.

The bank is obliged to confine its business within the limits which are almost universally assigned to the banker. Speaking generally, it may not deal in merchandise, or be engaged in any trade; it may not lend money upon the security of goods, or ships, or land and other immovable property, nor may it advance against its own stock, or the stock of any other bank. It may, however, under certain conditions, lend money to wholesale manufacturers, and to wholesale purchasers, shippers or dealers in various products, on the security of the goods they manufacture or deal in, and it may lend to any person on the security of a bill of lading or of a warehouse receipt. It may also lend money on the security of standing timber, and may make advances for shipbuilding, taking security on the ship. As additional collateral to a debt already contracted it may take security of almost any kind, and it has a first lien on its own stock for any liability due to it by a stockholder. It cannot recover by process of law any interest in excess of 7 per cent, but no penalties for usury now exist.

In addition to carrying on the ordinary business of a commercial bank, the Canadian banks receive money on deposit at interest, the prevailing rate at present being 3 per cent. Out of total deposits in the Canadian chartered banks of \$448,000,000 about 65 or 70 per cent would in the United States be deposits in Savings Banks. No securities are specially set aside against any deposits. Deposits due to the Dominion Government are a second charge on all the assets of the bank (the notes being the first) and those due to any Provincial Government are a third charge.

One bank may sell out all its assets to another bank, proper provision being made for the assumption of the liabilities of the selling bank. The purchase price may be in stock of the purchasing bank, or in such other form as may be arranged.

In the event of a bank suspending payment, it is taken in charge by a curator appointed by the Canadian Bankers' Association, who will control and supervise it until it either resumes payment or goes into liquidation. Suspension for ninety days, consecutively or at intervals within twelve consecutive months, constitutes the bank insolvent. If it becomes insolvent the shareholders are each individually liable for an amount equal to the amount of their respective holdings of subscribed stock in addition to any amount not paid up on such stock. This double liability does not exist in the case of the Bank of British North America, and its ordinary note issue is therefore confined to 75 per cent of its paid-up capital. Against any portion of the other 25 per cent which it may desire to issue,

it must make a special deposit with the government.

The giving of a fraudulent preference to any creditor, or the making of false returns, etc., on the part of any director or officer of a bank, is punishable by heavy fines or by terms of imprisonment.

Since Confederation sixteen banks working under Federal laws have gone into liquidation, their paid up capital at the time of suspension aggregating some \$9,000,000 and their total liabilities about \$25,000,000. Eight paid both note-holders and depositors in full, six paid note-holders in full, but not depositors, while two paid neither in full. Both of the last two failed before notes were made a first charge on assets, while one of them was a fraudulent affair, which was only in operation for a few months. The total liabilities of these two banks were only \$654,000. The total loss to creditors of insolvent banks has been about \$4,000,000.

No description of Canadian finances would be complete without some mention of Mortgage and Loan Companies, Public Savings Banks, and the incorporated Savings Banks, but a few lines only can be devoted to each. Mortgage and Loan Companies date from about 1845, and have played a not unimportant part in the development of Canada. Unlike the banks, they are not governed by one general Act, and whether they should be under the jurisdiction of the Federal or the Provincial Governments has not yet been decided. It has therefore come about that General Acts, and also Special Acts, have been passed both at Ottawa and in some of the Provincial Legislatures, and the Special Acts are not always in accord even with the General Acts passed by the same authority. Three or four companies owe their existence to Imperial legislation. The specific purpose, however, for which all these companies are supposed to be incorporated is the making of loans on real estate, and they are sometimes restricted to this class of security. In many cases they are also allowed to lend on the security of stocks, bonds, etc., and one or two charters give powers of *dealing* in such securities, but over 70 per cent of their total assets are loans on real estate. They are allowed to borrow from the public by taking deposits and by issuing debentures, about two thirds of the debenture issue being held outside Canada, principally in Scotland. The rate of interest paid varies, from about three and a half to four and a quarter per cent. The total amount which may be borrowed from the public is generally limited, and, as a rule, is made to bear some proportion to the paid up capital, or to the capital and cash combined, but no general principle exists. Until the last year or two the loan companies had an extremely good record, very few having failed and their creditors always having been paid in full. Recently, however, there have been one or two bad failures.

The following figures show the approximate extent of the operations of the loan companies during the last few years. In consequence, however, of there being no one authority which can compel uniform returns from all the companies, it is not pretended that they are complete.

Savings banks under the management of the Government are of two kinds: "Government Savings Banks," under the control of the Fi-

CANADA — FINANCIAL SYSTEM

Year	No. of Companies	(ooo omitted)		Liabilities (ooo omitted)			Assets (ooo omitted)

1902.....	92	47,667	11,479	21,069	52,848	95,941	105,536	14,061	102,532

nance Department," and "Post-office Savings Banks," which are part of the post-office system. The former were in existence in the Maritime Provinces for several years previous to 1867 and were taken over by the Federal government when the provinces entered into Confederation. In British Columbia Savings Banks controlled by trustees existed before Confederation, and these banks were wound up and "Government Savings Banks" established in their stead. A Government Savings Bank was opened in Winnipeg in 1871 and another in Toronto in 1872. In 1888 there were 50 offices with 57,367 depositors having \$20,682,025 to their credit, an average of \$360 for each depositor. It has now been recognized that these banks are no longer necessary, and whenever the position of superintendent of any office becomes vacant, the deposits in that office are transferred to the Post-office Savings Bank. We accordingly find that on 30 June 1903 there were only 23 offices still open, with 46,615 depositors and a total of \$16,515,802 on deposit, the average for each depositor being \$354.

In 1868 the system of Post-office Savings Banks which had proved so successful in Great Britain was introduced into Canada, 81 offices being opened on 1 April in that year. On 30 June 1903, 934 offices were open, the total number of depositors being 167,023, having \$44,255,327 to their credit, an average of \$265 for each depositor. In order to give some practical effect to the theory that both kinds of Public Savings Banks are intended as safe places of deposit for the poor and ignorant, the net amount which may be received from any person during one year is \$1,000, while the total amount which any depositor may have at his credit is \$3,000. The rate of interest paid in both classes of savings banks was formerly 4 per cent, but on 1 Oct. 1889 it was reduced to 3½ per cent, and on 1 July 1897 to 3 per cent. There is, however, no justification for even 3 per cent being paid. Canada is now able to negotiate term loans (against which no reserves need be kept) at a net interest rate of about 2.86. By an Act passed in 1903 the Department of Finance is obliged to hold as reserves against Savings Banks deposits an amount in gold, or in gold and Canada securities guaranteed by the government of the United Kingdom, an amount equal to not less than 10 per cent of the deposits. When to the rate actually paid on these deposits is added cost of reserves and expense of management (from one fourth to one half of 1 per cent per annum), the money held on deposit actually costs the country about 3.75 per cent. This fact is fully recognized by the government, and they recently proposed to reduce the rate paid to 2½ per cent, but, for political reasons, the proposal was withdrawn. Amounts held on

deposit by the government in certain years are as follows:

Year	Government savings bank	Post office savings bank	Total
1870.....	\$ 1,822,570	\$ 1,588,849	\$ 3,411,419
1880.....	7,107,287	3,945,669	11,052,956
1890.....	19,021,812	21,990,653	41,012,465
1900.....	15,642,267	37,507,456	53,149,723
1901.....	16,098,146	39,950,813	56,048,959
1902.....	16,117,779	42,320,209	58,437,988
1903.....	16,515,802	44,255,327	60,771,129

Apart from the Public Savings Banks the only savings banks of any importance are the City and District Savings Bank of Montreal and La Caisse d'Economie de Notre Dame de Quebec. The former has a paid-up capital of \$600,000, its deposits are about \$16,000,000, it holds securities of about \$8,000,000 and has loans against securities of about \$7,000,000. The latter has a paid-up capital of \$250,000, and deposits of about \$7,000,000. It holds securities of about \$4,000,000 and has loans of about \$3,000,000 against securities. These banks may invest not more than three fourths of their deposits in certain approved securities, including the stock of chartered banks, and may make advances against such securities. These are the only classes of investments which they may make. They are specially prohibited from lending on real estate.

It may be convenient to summarize here the approximate amount of public money held on deposit in Canada by the government and by the various institutions which accept deposits. Except in the case of the Mortgage and Loan Companies, the figures are as on 30 April 1904:

Government savings banks.....	\$ 16,291,400
Post-office savings banks.....	44,393,438
Total held by government.....	\$ 60,684,838
Chartered banks —	
Public deposits, payable on demand	\$104,112,729
Public deposits, payable after notice	301,044,721
	\$405,157,450
Quebec savings banks —	
Public deposits	23,056,357
Mortgage and loan companies (1902) —	
Deposits	\$21,069,000
Debentures	52,848,000
	\$ 73,917,000
	\$562,815,645

In addition, some deposits are held by private bankers. It is impossible to give an estimate of the amount, but it is quite inconsiderable. See CANADA — PUBLIC FINANCE; BANKS AND BANKING; FINANCE; MONEY.

(Secretary, The Canadian Bank of Commerce.)

Canada—Public Finance. When the federation of provinces, forming the Dominion of Canada, was achieved in 1867 (see CANADA—CONFEDERATION) the powers assigned to the provincial governments included the right to borrow money on the sole credit of the province, and right of direct taxation within the province in order to the raising of a revenue for provincial purposes. The right of management and the sale of the public lands belonging to the province, and of the timber and wood thereon, was also assigned to provincial governments, and, as will be seen later, has proved an important source of revenue (cf. Brit. N. America, Act, Sec. 92). To the Dominion Parliament all powers not specifically reserved to the provinces were given, and particularly control of the public debt and property, the borrowing of money on the public credit, and the raising of money by any mode or system of taxation. Thus the rights of the provinces to levy taxation for their own purposes are restricted in the mode in which they may be exercised, and cannot be so employed as to exclude the Dominion government from the use of any form of taxation found desirable. All the ordinary revenue of the Dominion is credited to a consolidated revenue fund, and on this fund are chargeable: (1) The expenses of collecting the public revenues; (2) interest on the debts of the provinces which the Dominion assumed; (3) the salary of the governor-general; the remainder of the fund being available for covering such appropriations as may be made by Parliament. Thus all ordinary revenue and ordinary expenditure are included in the consolidated fund accounts, and any balance of available funds may be used for capital outlay in place of covering such outlay by extraordinary revenues, such as loans. The progress of the revenue and expenditure of the Dominion is exhibited in the following summary:

REVENUE AND EXPENDITURE OF CANADA.

FISCAL YEAR ENDING 30 JUNE	Consolidated fund		Total Revenue \$,000	Total Disburse- ments \$,000
	Revenue \$,000	Expendi- ture \$,000		
1868.....	13,688	13,486	13,688	14,072
1878.....	22,375	23,503	22,406	30,546
1888.....	35,908	36,718	35,908	45,064
1893.....	38,169	36,814	38,209	40,854
1898.....	40,555	38,833	40,556	45,334
1903.....	66,037	51,692	69,348	61,747

Of the 36 years since confederation, in only 12 has the consolidated fund revenue failed to exceed the expenditure chargeable to that fund, namely in the years 1875-6 to 1879-80, in 1884-5, 1885-6, 1887-8 and 1893-4 to 1896-7. The aggregate revenue of the consolidated fund has been

\$1,186,500,000, and the expenditure chargeable on it \$1,127,800,000, thus leaving a surplus of \$58,700,000. Taking total revenue and total disbursements, the years 1870-1, 1881-2 and 1902-3 alone have shown surpluses. In addition, the expenditure of 1899-1900, apart from sinking-fund charges, showed a surplus, which, however, was barely one-third of the amount needed to meet the year's payments on account of sinking-funds. The aggregate deficit of the 36 years has been \$238,976,000, and the amount of \$53,098,000 has been paid to sinking funds and debt redemption in the period; so that the net outstanding debt has been increased by \$185,878,000, or about 15 per cent of the ordinary revenue raised during the period. It may be noted that capital expenditure on railways and canals, during these 36 years, has amounted to over \$188,000,000, or a sum exceeding the increase in the net debt. The chief source of the revenue of the Dominion is found in customs and excise duties. The progress of these items is exhibited in the following:

SOURCES OF REVENUE

Fiscal year ending 30 June.	Customs \$,000	Excise \$,000	Total taxes \$,000	Post office and public works, including rail- ways and canals \$,000	Various other sources \$,000
1868	8,578	3,003	11,701	1,427	560
1878	12,783	4,859	17,842	3,242	1,291
1888	22,106	6,071	28,177	5,935	1,796
1893	20,954	8,367	29,321	5,535	2,312
1898	21,705	7,871	29,576	7,401	3,578
1903	37,002	12,014	49,016	11,486	5,535

The great growth of tax revenue, over the whole period, its stagnancy from about 1880 till 1898, and the rapid increase of recent years are noteworthy features of the tables of which the above is an abstract. Till the year 1881-2 the tax revenue included an item, derived from bill stamps, since discontinued. The revenue from the post office and from railways and canals is required to maintain the services rendered by these enterprises, so that the public receipts and expenditure are swelled by the inclusion of items approximately balancing each other on both sides of the account. The principal of the various sources of revenue covered by the last column of the table are Dominion lands and interest on investments. These two items comprised, in 1902-3, two-thirds of the amount shown in the last column of the table. The dependence of the public revenue on the productiveness of the customs and excise is seen to be very great. From these sources chiefly are derived the funds needed to carry on the government. The response of the volume of the revenue to changes in the tariff cannot be treated in this place. The influence of the wave of business activity, which has, since 1897, swelled in most countries, and especially in America, is the most important element contributing to the expansion of revenue since that date.

Among the heads of expenditure, the debt charges form the largest single item. At the

CANADA — PUBLIC FINANCE

date of the formation of the Dominion the provincial debts were transferred to the Dominion, equitable arrangements being made by which Nova Scotia and New Brunswick might be favored in a degree corresponding to that represented in the transfer of the debt of the old province of Canada to the Dominion. Subsequently to the date of federation, responsibility for, in round figures, \$32,000,000 of provincial borrowings, additional to the \$77,500,000 of debt taken over at that date, has been assumed by the Dominion. The annual charges on account of debt increased rapidly up till about 1885, approximately doubling in amount between 1867 and that date; since 1885 the aggregate increase has been only about 10 per cent. The contrast between the earlier and later halves of the interval since federation is very striking. It is only in part due to a slower increase of the amount of the debt. The lower rates at which borrowing has been effected, as old loans fell due for renewal, have been very helpful to Canadian finance. An increasingly large amount of revenue is required for sinking-fund purposes, though the increase has been slower, and less as a total, in the second than in the first half of the period since the formation of the Dominion. A sum equal to nearly one fourth of the annual interest is now needed for meeting sinking-fund obligations. More recent loans have not had definite sinking funds attached to them.

The principal items of ordinary expenditure in the year 1902-3 were as follows:

Interest on public debt.....	\$11,068,000
Sinking funds	2,621,000
Public works.....	4,628,000
Post-office	4,105,000
Railways and canals.....	7,550,000
Collection of customs and excise.....	1,708,000
Militia	1,963,000
Mounted police	990,000
Administration of justice.....	960,000
Civil government	1,555,000
Legislation	789,000
Mail subsidies and steamship subventions...	799,000
Subsidies to provinces.....	4,402,000

This table includes items of smaller amount than some of those omitted. Those of greatest general importance are shown, and the table includes five sixths of the ordinary expenditure. This expenditure, which was about \$4.00 per head of the population in 1867-8 reached about \$9.40 per head in 1902-3. The last item in the preceding list represents a financial adjustment between the federating provinces and the federal government. The latter pays to the former an amount made up of two principal items, one an allowance for the expense of government, the other a payment based on population. The former allowances were fixed as follows: Ontario, \$80,000 per annum; Quebec, \$70,000; Nova Scotia, \$60,000; New Brunswick, \$50,000. The further annual grant in aid is at the rate of 80 cents per head of the population, as enumerated at the census of 1861 for Ontario and Quebec, and as enumerated at subsequent censuses for the other two provinces, until the number in each case reaches 400,000. New Brunswick has not yet reached this limit. Some additions to these subsidies and allowances have since been made, and the same general principle of computing the amount to be paid has been applied to other provinces as admitted to the Dominion. The allowances for government are: Manitoba, \$50,000 per annum; British Columbia, \$35,000; Prince Edward Island, \$30,000. The latter three

provinces received additional allowances in lieu of lands, amounting to \$100,000 per annum for each of the first two, and \$45,000 for the last. Other adjustments have been effected from time to time, and the aggregate of subsidies, for 1902-3, amounted, as stated above, to \$4,402,000, or about 85 cents per head of the present population of the provinces. The position of the provincial revenue and outlay, for the past quarter of a century, is shown, in summary form in the following table:

REVENUE AND EXPENDITURE OF THE PROVINCES.

AVERAGE OF FISCAL YEARS	Subsidies to provinces	Aggregate ordinary provincial	
		Revenue	Expendi- ture
1877-8 to 1881-2....	\$3,466,587	\$7,115,785	\$7,882,388
1882-3 to 1886-7....	3,904,316	8,288,856	8,929,119
1887-8 to 1891-2....	3,996,907	10,472,029	11,303,506
1892-3 to 1896-7....	4,173,363	11,422,476	11,825,931
1897-8 to 1901-2....	4,278,264	13,247,135	13,668,388

It will be seen that the aggregate of the provincial subsidies has grown, roughly, in about the proportion of the population of the Dominion, and that, whereas, in the first period shown in the table, they formed nearly one half the revenue of the provinces, in the last period they fell short of one third of the provincial revenues. In the light of this fact, the agitation for an increase in these subsidies can be readily understood. It must be added that the wording of the contract which determined the amounts of the subsidies at federation is explicit, and expressly excludes future claims for increase. The fact of a deficit in the provincial accounts, taken in the aggregate, is clearly shown in the above table. So far as Ontario is concerned, this unfavorable balance appears only in the first two of the five periods of the table. Quebec had an unfavorable balance in each of the first four periods, a small favorable balance in the last. New Brunswick, too, had a favorable balance only in the last period, while Nova Scotia achieved a favorable balance in each of the last two periods. Manitoba and British Columbia fail throughout to cover ordinary outlay out of ordinary revenue, and the deficit of the Pacific province outweighs the surplus of the four provinces already named as having a surplus in the last of the quinquennial periods dealt with. The Prince Edward Island accounts show a small deficit in each period, but they include capital outlay except in the years 1899-1900 and 1900-1. In the case of British Columbia, the accounts exclude charges on account of sinking funds and debt redemption from ordinary expenditure, and the real situation is consequently even less favorable than that shown. It may be noted, however, that from one fifth to one fourth of the ordinary expenditure of British Columbia in recent years has been on roads, streets, bridges, and wharves. It is possible that the charging of the whole of this on current revenue may more or less offset the considerations which gave rise to the preceding reflection.

The accounts of the provinces are not all made up to the same date, and changes in the date at which the fiscal year ends have been made from time to time in some of them. Ontario, Manitoba, and Prince Edward Island

CANADA — PUBLIC FINANCE

make up their accounts for calendar years; Nova Scotia and British Columbia for a fiscal year ending 30 September. New Brunswick closes its financial year on 31 October, and Quebec on 30 June. The relative amounts of the budgets of the different provinces are shown in the following statement relating to financial years ending in 1902, the ordinary revenues and expenditures only being shown:

1901-2	Revenue		Expenditure	
	Amount	Per Head	Amount	Per Head
Ontario	\$4,291,083	1.96	\$4,345,004	1.98
Quebec	4,515,170	2.70	4,400,677	2.69
Nova Scotia...	1,140,217	2.47	1,087,403	2.36
New Brunswick	826,066	2.48	845,637	2.54
Manitoba	1,443,256	5.28	1,248,128	4.56
British Colum'ia	1,807,925	9.38	2,537,374	13.17
P. E. Island...	324,670	3.17	324,185	3.16
Total ..	14,348,387	2.75	14,878,408	2.85

In view of repeated annual deficits on the ordinary budgets, as well as on account of capital outlay, the provincial debts have been substantially increased in the period covered by the statement given above. Between 1897 and 1902 the additions to debt exceeded 25 per cent of the ordinary revenue, taking all the provinces together. This mode of statement, however, obscures the actual fact, namely, that the chief increases of debt have been incurred by Manitoba and British Columbia, a fact entirely in accord with preceding statements as to the relation of revenue to outlay in the different provinces. The debt of Manitoba has been increased by nearly \$11,000,000 in the five years, which has nearly trebled it. British Columbia has added about \$4,000,000, or half the amount of the ordinary revenue of the period, to its debt. The differences in the mode of statement of accounts in the various provinces render summaries of outlay for special ends very difficult. On education, about \$2,500,000 was expended by the provinces in 1901-2. It must be borne in mind that the principal expenditure on education is that of the municipalities, not that of the provinces. On the side of income, the leading item, exceeding in aggregate amount the subsidies from Dominion funds, is the revenue from leases and sales of lands, timber and mining rights. These receipts from the public domain amounted to over \$4,600,000 in 1901-2. All the provinces, without exception, have succession duties among the taxes levied. These inheritance taxes yielded revenues totaling a little over \$600,000 in 1901-2. The taxation of corporations finds a place among the sources of revenue of most of the provinces, and so do license taxes on businesses of various kinds. British Columbia and Prince Edward Island make use of income taxes, and the former has taxes on real and personal property in operation in addition. Royalties on minerals and land taxes also find a place among the sources of provincial tax-revenue. No summary of municipal finance for the entire Dominion can be given. As an example of the comparative magnitude of provincial and municipal revenues and expenditures, the figures published for the province of Ontario may be quoted. The ordi-

nary revenue of municipalities of all grades in that province amounted in the aggregate to \$17,200,000 in 1901, of which \$13,600,000 was tax-revenue. The ordinary municipal revenue was thus, in this case, four times as great as the ordinary provincial revenue. In the course of the last 15 years the taxes imposed by municipalities for all purposes have increased in amount by 50 per cent. The principal mode employed in raising municipal revenue is to levy an assessment on the value of property, either real property, or all property, real and personal, while income is also made assessable with property in some cases. The municipalities of Ontario subject all these to assessment. The aggregate revenue of municipalities stated above includes \$1,445,000 derived from water, gas, electric, etc., enterprises in 1901. As large expenditures were required for the provision of the corresponding services, this was not net revenue, available for general purposes. The municipalities have, in every year, contracted new loans, but the repayment of old loans has, in the aggregate, nearly offset the new borrowings. The aggregate debenture debt has increased, in the five years to 1901, by \$7,600,000, while the borrowings on debentures have amounted to \$20,600,000 in that period. Loans for current purposes have amounted to \$28,700,000 in these five years, but less than \$1,400,000 has been added to the amount of such loans outstanding. The total amount of debt, for all municipalities in the province, was about \$59,500,000 of debenture debt and \$7,200,000 of floating debt, in 1901. These few references to Ontario municipalities may serve to illustrate the subject of municipal finance in Canada generally, especially affording an example of the relative extent of taxation for public purposes by the municipal, provincial, and federal (Dominion) authorities.

In connection with the subject of Canadian public finance, it is of importance to note that the mode of preparation and discussion of financial legislation is practically that followed in Great Britain, and contrasts in many points, and in marked degree, with that followed in the United States (see UNITED STATES—FINANCES, 1775-89, 1789-1861, 1861-1904). The estimates of expenditure are prepared by the government departments concerned, and, when approved by the ministry, are considered by the House of Commons sitting as a committee of supply. The responsibility for the amount and distribution of expenditure thus rests, originally, with the executive government, and its proposals need the approval of, and are presented for discussion by, the body of popularly-elected representatives. Similarly, the plan of taxation (or borrowing) by means of which the necessary funds are to be secured is submitted to the House of Commons, sitting as a committee of ways and means. The entire House constitutes each of these two important financial committees. The responsibility for the two sides of the year's finance is not divided between differently constituted committees. The proposals by which financial equilibrium is to be maintained are the proposals of the ministry, put forward by the Finance Minister. The stability of the administration is involved in the production of a plan for the coming year's finance which shall be acceptable to the House of Commons. The consideration of the balance of rev-

CANADA—CURRENCY, COINAGE AND LEGAL TENDER

enue and expenditure is an essential feature involved in the presentation, at a definite period of the year, of a statement setting forth the expenditure proposed and the means by which it is intended to cover it. In Provincial, as well as in Dominion, finance, the same principles are applied, of the presentation of an annual balance-sheet of income and expenditure, and of ministerial responsibility for the financial scheme involved in that balance sheet. It may be added, in conclusion, that the Dominion of Canada is entirely autonomous in financial matters. It is true that a small subsidy is paid by the Imperial government in respect of Sable Island, that is, the outlay there is recouped, in view of its being for purposes non-Canadian. Apart from this insignificant item, the finance of the Dominion is not involved in any way with that of Great Britain. No subsidy is received by Canada, no contribution in money is made by Canada for Imperial purposes. The share of financial responsibility assumed by the Dominion government in connection with the Pacific cable is of an entirely different nature from such subsidies or contributions, though it may aid in effecting purposes which are sought by some through these financial expedients. See also CANADA—THE FINANCIAL SYSTEM; and the paragraph *Finances* in articles on the provinces.

ALFRED W. FLUX,

Professor of Political Economy, McGill University.

Canada—Currency, Coinage and Legal Tender. Interesting as it would be to trace the history of the currency and coinage of the various British provinces from the time when grain and furs were the actual currency, down through the card money of de Meulles, the *ordonnances* of Bigot and the Army Bills of 1812 to the present satisfactory system, such a task is quite impossible within the limits set for this article. "Broadly speaking," says Chalmers, "the currency history of Canada consists in the transition from the French *écu* to the silver Spanish dollar, and from the Spanish dollar to the gold dollar of the United States. But this transition has reference exclusively to the standard coin; the characteristic feature of Canadian currency, both in the 17th century and at the present day, is paper." During the French régime a special colonial coinage was struck in France, but until the period when the chartered banks began to provide a stable medium of exchange, we find a large proportion of the currency consisting of the gold and silver coins of various countries, passing current and made legal tender at rates which were changed from time to time in the hope of keeping coin within the country. British, French, Spanish, Portuguese, German, Mexican and American coins were all legal tender, while for the first 50 or 60 years after the British conquest the actual currency of old Canada consisted chiefly of Spanish silver and some British gold, together with paper, more or less doubtful in value, issued by merchants, private bankers and others.

By ordinance of 1777, followed up by Acts of the legislatures of Upper and Lower Canada in 1796, the Halifax currency, with the Spanish dollar valued at 5 shillings, or four to the pound currency, was made the standard of the country, and new rates were established at which differ-

ent coins should pass current. The British guinea, which appears to have been the gold coin most in use, was worth £1 3s. 4d. currency. The Halifax currency, it will be observed, was to sterling money in the proportion of 10 to 9, £10 currency being the equivalent of £9 sterling. In Lower Canada, however, accounts were for many years afterwards kept in livres and sols, 6 livres being equal to one Spanish dollar, while in Upper Canada the York (or New York) currency was more or less in use, its basis being the Mexican *real*, known in North America as the York shilling, eight of which went to the dollar. Its use, however, was prohibited after 1 July 1822. With many attempts at change, and with variations in the ratings of different coins from time to time, the Halifax currency, which, it must be remembered, was a money of account only, remained as the legal currency system until 1853, when a decimal system having as its unit a dollar equal in value to the American dollar was introduced, and placed on an equal footing with the Halifax currency. On 1 Jan. 1858, the decimal system was finally adopted as that in which all public accounts should be kept, and since that date Canadian currency has really been on a gold monometallic basis, with a unit of value equal to the gold dollar of the United States.

The first Act of the Dominion Parliament dealing with the standard of value and the metallic currency was passed in 1868. It declared that it was desirable that the currency of Canada should be assimilated to the basis agreed on at the monetary conference held in Paris earlier in the year, and also that it should be of the same value as the metallic currency of the United States. It provided, however, for the continued use of the old "pound currency" when this was desired. This Act was repealed by the Act of 1871, which established the metallic currency on its present basis, the extension of the system to the whole Dominion being effected in 1881. In 1886 a Consolidating Act was passed, which reads in part as follows:

The denominations of money in the currency of Canada shall be dollars, cents and mills,—the cent being one hundredth part of a dollar, and the mill one tenth part of a cent.

The currency of Canada shall be such, that the British sovereign of the weight and fineness now prescribed by the laws of the United Kingdom, shall be equal to and shall pass current for four dollars eighty-six cents and two-thirds of a cent of the currency of Canada, and the half sovereign of proportionate weight and like fineness, for one half the said sum.

Any gold coins which Her Majesty causes to be struck for circulation in Canada, of the standard of fineness prescribed by law for the gold coins of the United Kingdom, and bearing the same proportion in weight to that of the British sovereign, which five dollars bear to four dollars eighty-six cents and two-thirds of a cent, shall pass current and be a legal tender in Canada for five dollars; and any multiples or divisions of such coin, which Her Majesty causes to be struck for like purposes, shall pass current and be a legal tender in Canada at rates proportionate to their intrinsic value respectively.

It will be observed that although the Canadian currency has a unit of value equivalent to that of the United States, the standard of value is the British sovereign.

Power was taken to make any foreign gold coins legal tender in Canada, and the American gold eagle of the weight and standard of fineness then existing, together with its multiples and halves, was made legal tender, each coin at its face value.

CANADA — CURRENCY, COINAGE AND LEGAL TENDER

The actual currency of the country consists almost entirely of paper (see BANKING SYSTEM), and as this has been found most satisfactory, no Canadian gold coinage has ever been struck. The silver and bronze coinage has hitherto been obtained through the royal mint, an arrangement which has proved most cheap and satisfactory. Influenced, however, by the large production of gold in the Yukon Territory, the government took authority during the session of 1901, with the concurrence of the Imperial government, to establish a branch of the royal mint at Ottawa, and as soon as this is in operation it is intended to inaugurate a Canadian gold coinage. However, no active steps toward the erection of the mint have yet been taken, and it is to be hoped that the proposal will be allowed to drop. Practically no gold is in circulation in Canada, all that there is in the country (about \$37,000,000 or \$40,000,000) being held as reserves by the Government and the banks. These stores are drawn upon for settlement of international balances, and for this purpose the British and American gold which is at present held is far more useful than any Canadian gold could be.

The subsidiary coins are five, ten, twenty-five and fifty-cent pieces, all silver, and one cent, bronze. These are tokens only, and the silver coins are legal tender up to ten dollars only, bronze up to one dollar. The total amount of silver coined and put into circulation in Canada since Confederation up to the end of 1903 is \$9,795,000, and of bronze \$449,000. None has ever been redeemed, and it is estimated that the amount now in circulation is from one half to one third of the total coined.

The history of the paper obligations of the Dominion Government really begins before Confederation, when in 1866 the Legislature of the Province of Canada sanctioned an issue of provincial notes to an amount not exceeding \$8,000,000. At Confederation this issue (as well as a small issue of Nova Scotia) was assumed by the Dominion, and the "Dominion Note" system was thus inaugurated. In 1868 provision was made for securing the note issue up to \$5,000,000 and 25 per cent of any excess by specie, the balance up to the limit of \$8,000,000 to be covered by Provincial or Dominion debentures. In 1870 the issue limit was raised to \$9,000,000, secured by 20 per cent of specie and 80 per cent of debentures, with authority to increase to any amount, providing the excess above \$9,000,000 was covered by specie. In 1872 it was provided that only 35 per cent of this excess need be so covered, while in 1875 it was enacted that for any issue between \$9,000,000 and \$12,000,000 specie to the extent of 50 per cent must be held, any excess above \$12,000,000 being entirely covered by specie. In 1880 the maximum issue was raised to \$20,000,000, to be covered to the extent of at least 15 per cent by gold, an additional 10 per cent by gold or Dominion securities guaranteed by the Imperial Government, and the remaining 75 per cent by ordinary Dominion securities. The issue might exceed \$20,000,000 to any extent, provided the whole of any excess was covered by gold.

The Act now in force was passed in 1903 and provides that:

Notes of the Dominion of Canada may be issued and outstanding at any time to any amount, and the notes issued and outstanding under the authority of this Act shall be known as "Dominion notes," and

shall be a legal tender in every part of Canada except at the offices at which they are redeemable. Such notes shall be redeemable in specie on presentation at branch offices established or at banks with which arrangements are made for the redemption thereof as hereinafter provided.

The Minister of Finance and Receiver General shall always hold as security for the redemption of Dominion notes issued and outstanding at any one time, up to and including thirty million dollars, an amount in gold, or in gold and securities of Canada, the principal or interest of such securities being guaranteed by the Government of the United Kingdom, equal to not less than twenty-five per cent of the amount of such notes so issued and outstanding, provided that the amount so held in gold shall be not less than fifteen per cent of the amount of such notes so issued and outstanding, and as security for the redemption of Dominion notes issued in excess of thirty million dollars an amount in gold equal to such excess.

The Act also enacts that any provincial notes still outstanding shall be held to be Dominion notes, and provides for redemption offices at Montreal, Toronto, Halifax, St. John, Winnipeg, Charlottetown, and Victoria. Under the authority of this Act the following notes were outstanding on 30 April 1904:

Fractionals	\$ 359,883
\$1 and \$2	11,235,200
\$4	430,477
\$5, \$10 and \$20	7,877
\$50 and \$100	157,200
\$500 and \$1,000	6,837,000
\$5,000	20,665,000
	<u>\$39,692,637</u>

A very large proportion of the large notes in circulation is held by the chartered banks for reserve purposes, and also as a medium in which to make their daily settlements with each other. A special form of note has therefore been issued, negotiable only between banks, and of no value except to a bank. This materially lessens the risk of loss by robbery when large amounts are being carried from one bank to another, or at any other time. Of the \$27,000,000 in large notes in circulation as above, \$23,926,000 were the special notes for the banks, and were therefore held by them. Of a total issue of \$39,692,637, \$30,251,958 were held by the banks, only a little over \$9,000,000 being in the hands of the public.

As security for the note issue, the following specie and debentures were held by the Minister of Finance:

Specie	\$21,507,688
Guaranteed Sterling Debentures, £400,000 sterling	1,946,667
	<u>\$23,454,355</u>
Specie and Guaranteed Debentures required to be held, 25% on \$30,000,000	\$7,500,000
Specie held in excess of \$30,000,000	9,692,637
	<u>17,192,637</u>
Excess of Specie and Guaranteed Debentures	6,261,718

The following table shows the average amount in circulation each year during recent years:

1884	\$16,434,385	1901	29,052,769
1890	15,501,360	1902	32,041,413
1895	21,397,750	1903	38,163,460
1900	26,550,465		

Legal Tender in Canada is: Full legal tender: (1) The British sovereign and half sovereign, at \$4.86½ to the £. (2) The American gold eagle, with its multiples and halves. (3) Notes of the Dominion Government, redeemable in specie on presentation.

Limited legal tender: (1) Silver coinage of Canada, up to \$10. (2) Bronze coinage of Canada, up to \$1.

Potential legal tender: (1) Any gold coin

CANADA—THE GRANGER MOVEMENT

for five dollars (or its multiples and divisions) of the British standard of fineness, which the Government may strike for circulation in Canada. (2) Any foreign gold coin, at rates to be fixed by proclamation. See CANADA—FINANCIAL SYSTEM; CANADA—PUBLIC FINANCE.

F. G. JEMMETT,

Secretary The Canadian Bank of Commerce.

Canada—The Granger Movement. The Granger Movement in Canada closely resembles in its economic and social features the movement of the same name in the United States from which it derived its initial inspiration. The Grange was first established in the province of Quebec in 1872 by Eben Thompson, a deputy from the United States. Two years later representatives from several Canadian Granges met at London, Ont., and organized the Dominion Grange of the Patrons of Husbandry. In the declaration of principles then adopted the motto, "Unity, Liberty, and Charity," was heartily endorsed. The objects of the organization were declared to be to develop a higher and better manhood and womanhood among the agricultural class; to enhance the comforts and attractions of their homes; to encourage farmers to buy less and produce more; to diversify their crops; to condense the weight of exports, selling more on hoof and in fleece, and less in the bushel. The society expressed itself as opposed to the credit system, and the mortgage system. It declared itself to be independent of political organizations, and dissociated from political parties. At the same time it was "reserved for every patron as his right as a freeman to affiliate with any party that will best carry out his principles." The declaration of principles laid stress upon the importance of the abilities and sphere of women, who were admitted both to membership and to office in the order. The growth of the Grange during the next few years was very rapid. With the Dominion grange as its center, it was organized in provincial granges, division granges and subordinate granges. In 1876 the secretary reported a total membership of 17,500 patrons, with 33 division and 530 subordinate granges. Of the latter 4 were in Nova Scotia, 7 in New Brunswick, 16 in Quebec, and 503 in Ontario. There were also six subordinate granges in Quebec, organized under the National Grange of the United States. In the following year the Grange was incorporated by the Dominion parliament, and in 1879 its membership reached 31,000. The Grange not only sought to exert an educative influence on the farming population by the distribution of literature, etc., but also set on foot, directly or indirectly, various economic enterprises of a co-operative nature intended to enable the farmers to buy and sell more cheaply by acting in union. Of these the most important was the Grange Wholesale Supply Company of Toronto, with a branch establishment at Halifax. This was a joint stock company whose capital was supplied by members of the society, and which sold farmers' supplies, seeds and minor machinery to the patrons at greatly reduced prices. The local distribution was effected by the members of the subordinate granges. The company issued for some years a paper devoted to the interests of the patrons under the title of the 'Grange Bulletin.' In this were printed extensive price lists of farmers' supplies offered

for sale. A similar undertaking was established in the form of the People's Salt Company of Kincardine. The economic enterprises of the Grange have not, however, met with marked success. The demands made thereby upon the initiative of the co-operative purchasers have proved too exacting. After some 10 years of successful existence the enthusiasm which the institution of the Grange had at first aroused began to cool, and many of the subordinate granges died of inanition. In the year 1876, 271 new granges had been reported in Ontario alone; in 1891 only two subordinate granges were organized in Canada, and in 1898 no new organizations were reported. Meantime the constant lapse of those in existence, through the apathy of their previous supporters, greatly reduced the numbers of the active patrons. The total number of granges instituted had reached about 1,000, but at the twenty-ninth annual meeting (2 and 3 Feb. 1904) the secretary's statement shows that only 13 division granges and 30 subordinate granges (with a membership of 411) had reported during the last year. The receipts of the treasury of the Dominion grange, which amounted to \$6,900 in 1876, fell to \$129 in 1904. Many persons had been led to join in the movement from the sanguine hopes of profit to be derived from the co-operative side of the enterprise, and fell away when these were not realized. On the whole, the grange movement must be regarded as a failure in the direction of its economic enterprises, but its influence for the social and educational advancement of the farming class has undoubtedly been great. During the flourishing period of the movement literary exercises alternated with the conduct of business matters at the local meetings. It has especially been instrumental in promoting various legislative measures in the interests of the farming class. Among these may be mentioned the Provincial Drainage Acts (R. S. O. C. 37, 38), the Dominion statute known as the Butter Act, etc. On the tariff question the opinion of the patrons has been divided: it has been difficult for the grange to adopt any decided position in the matter without identifying itself with party politics. The grange was, however, instrumental in securing the repeal of the duty on binder twine. The patrons have constantly sought to foster the cheese industry and the cattle trade with Great Britain; have succeeded in having agriculture taught in the public schools; and have strongly supported the agricultural college at Guelph. The grange has also agitated in favor of the inflation of the Dominion paper currency, the reduction of railroad rates, and the appointment (now effected) of a railroad commission. The Dominion grange sends annually a fraternal delegate to the meeting of the National Grange. See also GRANGERS; CANADA—Agriculture.

STEPHEN LEACOCK,

Lecturer on Political Science, McGill University.

Canada—The British Preferential Tariff. Canada was the first of the British colonies to secure the right of self-government, including fiscal autonomy. The last tariff made in Great Britain for Canada was that of 1842. The freedom of Canada to frame her own financial and trade policy has, since that date, become gradually more absolute. Formerly, the commercial treaties of the mother country were applicable

CANADA — THE BRITISH PREFERENTIAL TARIFF

also to the colonies, whether they would or not. The newer practice has been to leave the self-governing colonies free to accept or reject such treaties, so far as they are themselves concerned. Some of the older treaties remain, not having been revised since the introduction of this policy. The treaties with Belgium and the German Zollverein (see ZOLLVEREIN), dating from 1862 and 1865, respectively, even required the granting to these countries by British colonies of terms as favorable as those accorded to the mother country. The most-favored-nation clause in other treaties extended these privileges to other countries. The stipulations of these treaties, then, deprived Canada of power to grant preferential terms to the mother country, thus limiting her complete fiscal freedom. In 1897 Canada took a step which led to the removal of this restraint. The accession to power of a new government, under Sir Wilfrid Laurier (q.v.), was followed by a revision of the tariff. This revision was characterized by two leading principles. The first was the reduction of all duties (except those on spirits and tobacco) of excessive amount, so that the standard maximum rate became 35 per cent ad valorem. The second was a further special reduction of duties on imports from any country which might offer to Canada equally favorable tariff rates in return. Excluding spirits and wines, and tobacco, cigars and cigarettes from the operation of the reduced tariff, a deduction of one eighth ($12\frac{1}{2}$ per cent) of the duty payable was to obtain for the first year, and thereafter a deduction of one quarter of the duties (25 per cent). Practically, the preferential rates of duty thus instituted affected no other country than Great Britain and certain of the British colonies. In form, the advantages were open to all, not to the mother country exclusively. In spite of this, the decision was reached that the treaties with Germany and Belgium compelled the extension to those countries of whatever remission of duties was accorded to the United Kingdom. The government of the United Kingdom duly notified the governments of Germany and Belgium that the treaties in question would be terminated, and from 31 July 1898 they ceased to be in force. When this had been accomplished, the form of the preferential clause in the Canadian tariff underwent a change. It no longer offered reciprocal advantages to all countries, but only to the other divisions of the British empire. The title of the schedule setting forth the amount and conditions of the rebate of duties changed from that of "Reciprocal Tariff," adopted in 1897, to that of "British Preferential Tariff." That it should be the latter in fact had been intended from the first, and no time was lost in making its form correspond with its purpose. It would appear that the form originally adopted was selected with a view to avoid collision with the obnoxious treaties. The appearance of deliberately forcing the hands of the British government was not afforded prominence, but the pressure actually exerted proved sufficient to secure the denouncing of the treaties. A further step in developing the preferential treatment of British imports into Canada was taken two years later, when the rebate of duties was raised from one fourth to one third. When the preferential tariff was first instituted, the severity of the

consequent pressure on certain home industries was modified by advancing a few of the duties of the general tariff, so that the net rates, after deducting the rebate on British goods, might not become so low as to threaten home interests. When the rate of the rebate was increased in 1900, its effect was not qualified by any such preliminary adjustment of duties. The further development of preferential trade within the British empire was discussed by representatives of the colonies and of the home government at the Colonial Conference of 1902. So far as Canada was concerned, a willingness to extend the preference, in response to reciprocal favors, was indicated. The nature of such possible extension was sketched as follows: (1) Increase of preference on particular goods. (2) Raising of the general tariff on various articles. (3) Imposing duties on foreign imports hitherto admitted free of duty. These proposals and the general discussion of the subject have made fairly clear the direction in which changes of the Canadian preference are likely to take place. The indications afforded are entirely confirmed by the utterances of the Finance Minister in introducing the budget of 1904. The uniform rate of preference is to give way to two tariffs, the one applicable to ordinary foreign trade, the other, with lower rates, applicable to British trade. The minister further foreshadowed a special tariff, with rates higher than those of the general tariff, to be applied in the case of nations not granting Canada most-favored-nation treatment. By thus elaborating the tariff schedules, the pressure felt by particular industries as a result of the preference will be modified. A simple increase of the rate of preference would either make the reduced rates on some goods so low as to provoke an outcry which could not be ignored, or would require the rates of the general tariff to be raised to an almost prohibitive level, contrary to the spirit in which the authors of the preference set about the revision of the tariff. The employment of a rate of preference varying from one class of goods to another is the obvious solution of the difficulties of the situation. After the expiration of the treaty of 1865 between the German Zollverein and the United Kingdom, some arrangements were necessary pending the negotiation of another treaty. Germany arranged to grant most-favored-nation terms to the whole of the British empire, with the exception of Canada. To Canada the German general tariff was applied, in view of the fact that Canada was favoring British trade more than German trade. Vain attempts were made by Canada to procure a modification of Germany's action toward her, and, failing in these attempts, Canada retaliated in 1903 by imposing a surtax of one third of the duties otherwise payable on all German goods imported into the country. This surtax corresponds to the higher rates of the third division of the elaborated Canadian tariff which is foreshadowed.

Canada claims that the tariff arrangements between different divisions of the British empire are domestic affairs of that empire, and do not justify a foreign nation in imposing disabilities on particular parts of the empire. The claim, and the principle on which it rests, are apparently reasonable. It is true that no other country than Great Britain grants fiscal

CANADA—THE BRITISH PREFERENTIAL TARIFF

autonomy to its colonies. This fact is held to deprive of force the citation of the example of other cases where preferential arrangements between colonies and their motherlands have not affected the interpretation of most-favored-nation clauses. So long as the Belgian and German treaties remained in force, this might be contended with reason. Hence the irritation which led to their denunciation. Before passing to consider the effect of the preferential tariff on Canadian trade, it may be noted that the effect of the German surtax has been remarkably clearly shown in the trade returns. In the first 10 months of the fiscal year 1903-4, the dutiable imports from Germany into Canada were \$3,281,000, or 38 per cent, less than in the like period of the preceding year, when they amounted to \$8,648,000. But whether from the delay in the full application of the surtax, or from the fact of the importation of goods through Germany from other countries, \$3,211,000 of the imports from Germany, in the 10 months in question, were not subject to the surtax. Deducting this amount from the preceding year's figures, the reduction of \$3,281,000 has taken place on a total of \$5,437,000. The imports of free goods had slightly increased, namely, from \$1,359,000 to \$1,618,000. Of the imports from Germany in the 10 months ending April 1903, \$3,271,000 were sugar. In 1903-4 no sugar was imported subject to surtax, and the value of sugar imported from Germany under the general tariff was \$577,000. Thus, of the total reduction of imports, amounting to \$3,281,000, not less than \$2,694,000 may be assigned to the cessation of sugar imports. The reduction in other goods may be placed at \$587,000, on a value of \$2,773,000 subject to surtax on direct importation from Germany, or about 20 per cent. What the effect on the indirect importations of German goods has been cannot be seen; as the records of earlier years do not show the extent of these importations. As the amount of imports from Germany had been increasing rapidly in preceding years, the reduction in the trade figures is more likely to give an under-estimate than an over-estimate of the effect on the trade. The entire destruction of the export of German sugar to Canada, and the transfer of this trade to the British West Indies and British Guiana, is a notable result of the surtax policy.

Turning now to the examination of the trade records for the purpose of determining the effect of the preference on the import into Canada of British goods, we find that, in the year preceding the institution of the preferential tariff, namely, 1896-7, the dutiable imports into Canada from Great Britain were valued at \$20,200,000. In 1902-3, the sixth year of the preference, they reached \$42,200,000. Meanwhile, free imports from the same quarter had increased in value from \$9,200,000 to \$16,600,000. To find figures of imports from Great Britain exceeding those of 1902-3, we must go back to 1874-5, when price-inflation exaggerated the nominal values entering into trade. In absolute magnitude, therefore, the trade has grown largely under preference, and that after a long period of decrease. But it is not only the trade of Canada with Great Britain which has grown rapidly in these years. The total trade of Canada has also increased with great rapidity. In 1896-7, the year before the prefer-

ence was instituted, 30.53 per cent of Canada's dutiable imports, 22.73 per cent of her free imports, were obtained from Great Britain. In 1902-3 the corresponding figures were 30.85 and 18.84 per cent. The smallest proportion of dutiable goods which has ever been recorded as supplied from Great Britain was in 1901-2; the smallest proportion of the aggregate imports was reached in 1900-1. The imports from Great Britain were 26.15 per cent of the total imports of Canada in 1902-3; they were 27.58 per cent of the total in 1896-7, and had never previously been below 30 per cent of the total. The check which has apparently been placed on the process of diminution of the proportional share of Great Britain in Canada's import trade is certainly a distinct advantage accruing to Great Britain from the operation of the preferential tariff. But the advantage due to the preference appears much less, when measured by the proportional share of Canada's imports supplied by the mother country, than when measured by the change in the aggregate amount of those imports. The increase in aggregate amount is part of a general increase in Canadian trade since 1897. The United States supplied 53.5 per cent of Canada's imports in 1896-7, and 57.3 per cent in 1902-3, so that, in this case, the advance has been one, not merely of total value of goods supplied, but of proportionate share in the trade. It can readily be understood that the United States is able to supply goods adapted to the needs of Canadian consumers more readily than can be done by British manufacturers. In many lines the conditions to be met in Canada and in parts of the United States are closely similar, so that the goods which suit the latter market are well adapted to the needs of the former. This consideration appears to have had great weight even against the advantages offered by preferential rates of duty. A good illustration is afforded by the case of many classes of iron and steel goods, the proportion of which supplied by the United States continues to increase, while the proportion supplied by Great Britain decreases. The extent of the rebate of duties under the preference clauses of the Canadian tariff is shown in the following table:

DUTIES ON IMPORTS UNDER THE PREFERENTIAL
TARIFF, AND AMOUNT OF THE PREFERENTIAL
REBATE, 1897-8 TO 1902-3.

ON IMPORTS FROM	Duty collected	Rebate of duty	Value of goods
	Thousands of dollars		
Great Britain.....	32,571	12,707	158,400
British Empire, other than Great Britain.....	1,526	693	8,020
All other countries.....	1,987	406	7,981
All countries.....	36,084	13,806	174,401

The figures of the middle column, showing the rebate, are calculated from the rates at which rebate has been granted from year to year. It will be observed that, during the short period when the preference extended to foreign countries enjoying most-favored-nation treatment, the advantage taken by those countries was

CANADA — THE BRITISH PREFERENTIAL TARIFF

very great. The imports from Great Britain are only entitled to preferential treatment when they are British goods, and wine, spirits, and manufactured tobacco are not in any case granted rebate of duty. About one sixth in value of imports from Great Britain fail thus to secure a preferential rebate of duty, and the duties on these amounted, in the six years to which the above table refers, to no less than \$15,593,000 on a value of \$32,215,000. The high duties on spirits and tobacco are responsible for the high proportion of duties to values in this part of the trade with Great Britain. If we were to note simply the average rate of duty charged on goods imported from Great Britain, it would appear that some preferential rebate is needed to offset a special burdensomeness of the tariff on this section of imports. If we exclude wines and spirits and tobacco from the account, and calculate the average rate of duty levied on other dutiable imports, we find that it was close to 24 per cent in each of the years 1901-2 and 1902-3. Adding to the duties actually collected the amount of the preferential rebate, the result shows the average rate of the general tariff, namely, 26½ per cent to within a small fraction. On goods from Great Britain securing preferential treatment, the actual duties collected were 18.8 per cent of the aggregate value in 1901-2, and 18.5 per cent in 1902-3. The rates of the general tariff on these goods were, therefore, about 28 per cent, as an average, compared with 26½ per cent on all goods with the exception of spirits and tobacco. On imports from the United States, the average rate charged was approximately 25 per cent. The comparative lowness of this rate, like the large proportion of free goods supplied by the United States, is not difficult to explain. Raw materials and instruments of industry are rated at moderate duties when they are not admitted free. The fact that goods from the United States are charged to duty at rates lower than those imposed, apart from the preference, on goods from Great Britain, with the fact that so large a part of the imports from the United States are free of duty, has led to some suspicion of the *bona fide* nature of the British preference. It is clear from the foregoing that the difference of the rates charged on goods properly comparable is but little in favor of the United States, and the reason for the difference is obvious, and implies no reflection on the makers of the tariff. It is a point worthy of attention that approximately one half of the preferential rebate is accounted for by two items, woolen manufactures and cotton manufactures. The tariff rates on these are higher than on most goods. Calculations similar to the preceding show that the general tariff on woollens entitled to the preference stands at an average rate of 34 per cent, while for cottons the rate is 31 per cent. The rebate is therefore in excess of 10 per cent of the value of the goods, and it would be a fair conclusion from the figures that the classes of goods imported most largely are those on which the general tariff rate, and therefore the preferential rebate, is highest. About 70 per cent in value of woollens imported come under the preferential tariff, and about 60 per cent of cotton manufactures. The import of the latter has grown steadily during the whole of the six years since the institution

of the preference, but the part affected by the preference has not increased more rapidly than the part not so affected. In regard to woollens, the proportion affected by preference was larger during the period when the preference was not confined to the British empire than it has since been. It is true that, since the rate of preference was increased in 1900, woolen imports have increased faster than before, but again the figures show that the growth is not confined to, not more marked in, the trade under preferential tariff rates, than in the rest of the woolen imports. Of all goods imported under the preferential tariff, about 27 per cent by value are woolen goods, about 15 per cent cotton goods. The cotton and woolen industries are therefore largely affected by the preference. That their representatives should cry out for a reduction of the preference is intelligible enough at first sight, and that the rate of the rebate on woolen goods should be reduced in response to that cry is readily understood. But the reasonableness of the outcry, and of the concession to it, are less obvious when we regard the fact that the proportion, of woollens favored by the preference to the total of woollens imported, is not growing.

It remains to consider briefly the attitude of the Canadian people toward the preferential idea. At its introduction in the tariff of 1897, it formed the most prominent feature of a change in the tariff in the direction of moderation. Other readjustments of the tariff about compensated each other, though the elimination of prohibitive rates of duty is a move toward freer trade, even though the average duties actually levied do not decrease in proportion to the value of goods subject to them. In actual reduction of rates of duty, the preferential rebate represents the net concession of the 1897 tariff. It was thus not only, or, perhaps, even chiefly, an advantage to trade with the mother country, but a method of tariff reduction. Canada's advantage was sought, and continues to be sought, in the arrangements of the tariff, and the modification of particular rates of duty, or of preferential rebate, is aimed at securing the advantage, real or supposed, of Canada. Another point of view was, and is, found, namely, that the rebate is a sacrifice of Canadian interests to those of the mother country, or of the empire. This sacrifice is believed to require, as justification and compensation, preferential terms for imports of Canadian products into the United Kingdom. The two great political parties of the Dominion appear to differ mainly on this point in their attitude to the policy of preference. Both would gladly welcome a British tariff which granted a preference to colonial products. The one party is content to grant concessions to trade with the mother country, in Canada's interest as well as that of the mother country, leaving it to Great Britain to determine whether reciprocal advantages can be offered, though strongly desirous of such reciprocity in preferences. The other party is inclined to represent the Canadian preference as only to be justified by a reciprocal British preference, and to openly declare its sympathy with the active supporters in Great Britain of tariff changes which should include preferential treatment of colonial imports. The belief is very widespread in Canada that the country would gain largely by such

CANADA—THE BRITISH PREFERENTIAL TARIFF

a system of colonial preferences in Great Britain. It seems hardly possible, however, that such preferences can touch raw materials, or anything but food products. So far as Canada is concerned, a preference on grain appears likely to stimulate the development of the Canadian West, to the advantage of manufacturing industry in the East. The growth of population engaged in cultivating the soil means an enlarged market for manufactures, but if this market be secured by Canadian manufactures, two results must follow. Immigrants must be employed in manufacture, thus decreasing the flow to the western prairies; and to the extent to which the new market is held by Canadians, it will not afford the enlarged outlet for British manufactures in anticipation of which British voters are being urged to support the policy of a tariff with colonial preferences. The currents of trade in Canada are more and more flowing east and west. The nature of Canada's natural products, and the trade policy of the United States, as well as the political relation of Canada to the United Kingdom and the institution of preferential trade, tend to produce this result. Whatever the advantages of freer trade intercourse with the United States, it appears unlikely that Canada will be willing to pay a high price for them or to prejudice her imperial trade relations for their sake. Even had no other advantage been secured by the Canadian Imperial Preferential Trade policy, it has aided powerfully in establishing Canadian goods in the English market. See also CANADA—*Commerce, Tariffs, and Transportation*.

ALFRED W. FLUX,
Professor of Political Economy, McGill University.

Canada—The Trade of the British Empire. It is often said that the British empire was built up by trade, and the opinion that the development of trade between its different parts is the surest means of consolidating it for political purposes is widely held. How best to de-

and comparing them with a recent and a fairly distant date, so as to show the tendency of movement.

TRADE OF THE BRITISH EMPIRE.
(Millions of Dollars.)

AVERAGE OF YEARS	Imports			Exports		
	Total	From the Empire	From foreign countries	Total	To the Empire	To foreign countries
1867-71	2,003	736	1,267	1,729	697	1,032
1892-96	2,852	1,020	1,732	2,323	962	1,361
1898-02	3,634	1,299	2,335	2,835	1,201	1,574

This table shows that, in 30 years, the total foreign trade of the empire has increased from 3,732 millions of dollars to 6,469 millions, and that the part of it which consists of trade with other parts of the empire has increased from 1,433 millions to 2,560 millions. The proportion of inter-imperial trade has increased from 38 per cent of the whole to 39 per cent. Imports from other parts of the empire have fallen from 37 per cent of total imports to 36 per cent. Exports to other parts of the empire have increased from 40 per cent of total exports to 44 per cent. In these computations the trade between the different colonies of what is now federated Australia has been omitted from the reckoning throughout. In some degree, then, it seems that the empire purchases more largely from outside than formerly, though its sales are made more exclusively within its own bounds. As the course of development has, naturally, not been uniform, the trade between the United Kingdom and various portions of the colonies and dependencies may be examined in a little greater detail. First, considering imports into the colonies, the position is found to be as follows:

In examining this table, the exceptional situation of the Straits Settlements is manifest. The fact that the trade of Singapore is very

TOTAL IMPORTS OF BRITISH COLONIES.
(Millions of Dollars.)

	Average of 1867-71			Average of 1892-96			Average of 1898-1902		
	Total of Imports	Imports from Britain	Per cent from Britain	Total of Imports	Imports from Britain	Per cent from Britain	Total of Imports	Imports from Britain	Per cent from Britain
India	224	155	69	257	185	72	334	221	66
Straits Settlements	42	11	27	103	13	13	139	15	11
Self-Governing Colonies.....	208	120	58	364	215	59	581	292	50
Other colonies and protectorates	70	27	39	92	38	41	122	45	37
Total	544	313	58	816	451	55	1,176	573	49

velop the trade is matter for strong differences of opinion. Other countries regard the large and profitable trade between the British Isles and the outlying parts of the British empire as something to be imitated, if the proper procedure to that end could but be accurately ascertained. The actual status of the trade between the different parts of the empire, and the general direction of any changes which are taking place, will be briefly indicated in what follows. A summary of the situation is given in the following table, setting forth the data for the latest years for which complete returns are available,

largely an *entrepôt* trade sufficiently explains the apparently exceptional condition of affairs. It must be noted that the trade of Hong Kong, of Malta, and of Gibraltar cannot be included in the above, for want of returns. Especially conspicuous in the record of expansion of trade during the past generation are the figures relating to the self-governing colonies. This designation in the table applies to the same colonies throughout, though not all of them have been entitled to that description throughout the period covered. The differences between the different colonies are shown in the next table.

CANADA—THE TRADE OF THE BRITISH EMPIRE

The proportion of imports from Great Britain has decreased in every case, though the value of these imports has increased in every case except that of Newfoundland. The nature of the goods

the colonies from other colonies have increased much more than imports from foreign countries, though the latter have increased more than imports from Great Britain. How far the growth

required by the colonies has been one cause of the decreasing share obtained from the mother country, though this is due also, in part, to the activity of the competition of other nations in colonial markets. The agitation in favor of preferential treatment of British goods by the colonies (see CANADA—THE BRITISH PREFERENTIAL TARIFF) is, in part, due to the consideration of such facts as are suggested by this table. A preceding table showed that, in the empire as a whole, the inter-imperial trade had been fairly well maintained. The growth

in foreign imports is exaggerated by increased accuracy of the returns of countries of origin, cannot be ascertained. It is certain that goods are now obtained directly from some countries whence they were formerly obtained via Great Britain and thus included in the record with British goods.

Turning to the returns of exports from the colonies, and, in particular, of the self-governing colonies, the following tables show, in a form similar to that adopted for imports, the amounts and changes of the trade:

EXPORTS OF THE SELF-GOVERNING COLONIES.

of colonial imports has, it is clear, therefore, been from other colonies rather than from the mother country; only in part has it been from foreign countries in substitution for British trade. In particular, in the interval between the last two periods of the tables, the imports into

A striking feature of this exhibit is the fact that in the case of the self-governing colonies alone has the proportion of exports to the mother country increased, though this is not true of all of them. What was stated of imports applies also to exports, namely, that exports to

CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES

other colonies have grown with great rapidity in recent years, while, as far as the records go, the exports to foreign countries have grown somewhat more in proportion than those to the mother country. The comparison of the trade between the colonies and the mother country with the total trade on the two sides respectively, is set forth below:

The relative importance of the trade between the colonies and Great Britain is clearly much

Canada — Reciprocity between Canada and the United States. The question of mutual tariff concessions between the United States and Canada, has been a subject of constant interest. But at no time in the history of the two countries, except in the brief interval between 1854 and 1866, has there been any serious adoption of the principle of reciprocal lowering of duties. Previous to 1846 the tariffs and trade of the British colonies were regulated

greater from the standpoint of the colonies than from that of Great Britain. Proposals looking to reduced taxation on trade within the empire as compared with external trade must be considered in the light of actual facts. If inter-imperial trade is to be made to contribute but lightly to colonial revenues, the basis of revenue-taxation is very much narrowed. The question cannot be considered adequately without an examination of the classes of goods concerned, on which taxation is actually levied, in greater detail than is proposed here. The general tendency of the trade figures set forth is to show a marked contrast between the British and colonial aspects of the problem. To grant colonial preferences in Britain would mean imposing taxation which would affect the stability of the foreign trade, whose magnitude relative to the colonial is shown above. Were it possible to admit British goods to the colonies at nominal tariff rates, Great Britain might find some compensation for interference with her foreign trade. Fiscal needs at present render it impossible for the colonies to abandon duties on inter-imperial trade, while vested interests in many places would prove obstacles to such a movement, even if the fiscal situation permitted a practical abandonment of the customs duties on British goods. See also *GREAT BRITAIN — Commerce, Export Statistics; CANADA — THE BRITISH PREFERENTIAL TARIFF; CANADA — COMMERCE, TARIFFS, AND TRANSPORTATION.*

ALFRED W. FLUX,

Professor of Political Economy, McGill University.

by the mother country. After the Peace of 1783, the British Navigation Acts in restriction of colonial trade, and the British discriminating duties in favor of the mother country were applied against the United States. Congress early adopted a mildly protective tariff (1789) and enacted navigation laws. But in the era following the War of 1812-15, public feeling on both sides of the Atlantic increasingly condemned this restrictive policy.

By a statute of 1846 (9 and 10 Vict. c. 94) the British colonies in North America were empowered to repeal the existing differential tariff made for them by the Imperial Parliament. The Province of Canada availed itself of this permission to enact (1847) a uniform tariff of 7½ per cent against British and American manufactures alike. Nova Scotia adopted the same course. New Brunswick maintained a discriminating tariff against the United States. The remaining parts of the Navigation Acts were repealed in 1849 (12 and 13 Vict. c. 29). Meantime public feeling in Canada and the United States favored still greater freedom of intercourse. The general prevalence of the doctrine of free trade, its triumph in England (1846), and the adoption by the United States of the low tariff of 1846, set strongly in this direction. Attempts were first made to establish reciprocity by means of concurrent legislation in Congress, and the Canadian legislature. It was hoped in this way to avoid the constitutional question that might arise should the President exercise his treaty-making power for the regulation of customs duties. The Canadian Parliament passed an act to the desired

CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES

effect in 1849. But the legislation introduced in Congress in 1848 and 1850 failed to pass, Congress being unwilling to concede reciprocal lowering of duties without obtaining the free navigation of the Saint Lawrence. Finally Congress adopted a resolution (1853) asking the President to settle both these matters, together with the coast fisheries, by treaty. A like wish having been communicated from Canada to the Crown, Lord Elgin, the governor-general of Canada, was sent to Washington to arrange a treaty. William Marcy, the secretary of state, conducted the negotiations for the United States. The result was the Reciprocity Treaty signed 6 June 1854. It was duly ratified, and an act of Congress passed (Approved 5 Aug. 1854) to carry out its provisions, which came into effect by proclamation 16 March 1855. The terms of the treaty were as follows. An enumerated list of natural products (Art. 3) were to be admitted free of duty between British North America (Canada, New Brunswick, Nova Scotia, and Prince Edward Island) and the United States. According to these specifications no manufactured articles were to be admitted. The treaty further provided for the free navigation of the Saint Lawrence and the opening of the coast fisheries of each country to the fishermen of the other. It was to remain in force for 10 years and further "until the expiration of 12 months after either of the high contracting parties shall give notice to the other of its wish to terminate the same." The reciprocal relations thus established lasted for 11 years. The economic effect of the treaty is still a matter of controversy. The following figures illustrate the course of trade between the United States and British North America before, during, and after the Reciprocity Treaty:

Year	Imports United States from British North America	British North America from United States
1852.....	\$ 5,469,445	\$13,993,570
1853.....	6,527,559	19,445,478
1854.....	8,784,412	26,115,132
1855.....	15,118,289	34,362,188
1856.....	21,276,614	35,764,980
1857.....	22,108,916	27,788,238
1858.....	15,784,836	22,210,837
1859.....	19,287,555	26,761,618
1860.....	23,572,796	25,871,399
1861.....	23,724,489	28,520,735
1862.....	18,515,685	30,373,212

1864.....	29,608,736	7,952,401
1865.....	33,264,403	27,269,158
1866.....	48,528,628	27,905,984
1867.....	25,044,005	25,239,459
1868.....	26,261,378	22,644,235
1869.....	29,293,766	21,680,062

Complete statistics illustrative of the operation of the treaty can be found in the appendix to an article thereon by Professor Haynes in the publications of the American Economic Association, Vol. VII. The stimulus it afforded to trade between the two countries is undoubted, but it must be remembered that the situation during a large part of the treaty period was quite exceptional. The inflated prices of agricultural products due to the Crimean War stimulated the farming industry. The strain of the American Civil War naturally led to an increased importation of Canadian products. The great increase for the fiscal year ending 30 June

1866 (\$48,528,628), was partly due to the rush of importation in view of the prospective abrogation of the treaty. During the earlier years of the operation of the treaty, it met with a general approval. But unfortunately for its continuance it was presently claimed on the part of each country that the existing arrangement unduly favored the other, and that the provisions of the treaty had not been faithfully observed. The American contention can be found in detail in the report made by Mr. Israel T. Hatch 28 March 1860 (House Executive Document No. 96, 36th Congress, 1st Session, Vol. 3, pp. 1-48), in the concurrent resolutions in the New York legislature early in 1862, and in a report made to the House by Representative Ward on behalf of the Committee on Commerce (House Committee Reports, 37th Congress, 2d Session, Vol. III., No. 22). It was here claimed that the increase of duties on manufactured articles adopted by Canada since 1854 was a virtual violation of the treaty. The navigation rights secured by the treaty were argued by Mr. Hatch to have been of little actual benefit, only 40 American vessels with a gross burden of 12,550 tons, having gone down the Saint Lawrence during the first six years of the treaty. "Our railroads," he said, "suffer from a British competitor (the Grand Trunk) supported by privileges equivalent to the taxation on their business with the Canadian Province, and the interior of our own country." The New York resolutions denounced the "gross inequality and injustice existing in our present intercourse with Canada," and called for a revision of the treaty. As against these contentions the Canadian side of the controversy appears in a report made by Mr. A. T. Galt, Canadian minister of finance (March 1862). The increase of Canadian duties on certain manufactures, from 15 to 20 per cent, he declared to be due solely to financial exigencies, and to be a quite legitimate step since the "treaty contains no reference to manufactured articles whatever." To show Canada's sincerity, he instanced the "repeal of tonnage dues on Lake Saint Peter," and "the abolition of tolls on all vessels, whether American or Canadian." He argued further that the "spirit of the treaty," had been "infringed by the United States by the imposition (though removed on protest) of heavy consular fees on proof of origin, tantamount to a duty." The ill-feeling thus engendered in regard to the treaty was still further aggravated by the strained relations of the war period. Indeed competent authorities on both sides attribute its final abrogation to the violence of partisan feeling, rather than to commercial reasons. Charles Francis Adams, minister to Great Britain, wrote (February 1865) that the measures for abrogation "were the result rather of a strong political feeling than of any commercial considerations." As a result Congress (16 Jan. 1865) passed resolutions calling on the President to give notice of the termination of the Reciprocity Treaty. This having been done, the treaty expired in 12 months (17 March 1866). The British government made no attempt to preserve reciprocity, but efforts were made in its behalf both in the United States and in Canada. A convention was held at Detroit (July 1865) consisting of representatives of boards of trade, etc., of the leading American cities and Cana-

CANADA—RECIPROCITY BETWEEN CANADA AND THE UNITED STATES

dian provinces. The hope that had been freely expressed in the United States that the desire for renewed reciprocity might lead to annexation, was defeated by the action of the Canadian delegates, but the convention, while approving the abrogation of the present treaty, passed a unanimous resolution in favor of a new one. At the eleventh hour (January 1866) a Canadian delegation of provincial cabinet ministers came to Washington and endeavored fruitlessly to arrange a new basis of agreement. Since the expiration of the treaty in 1866, reciprocal trade relations (except in fish under the Washington treaty of 1871 [q.v.]) have never again been adopted.

Repeated efforts have, however, been made on both sides of the line for their re-establishment. The federation of the Dominion of Canada (1867) was followed by the adoption of a tariff which contained a standing offer for a resumption of reciprocity. Meantime the Canadian minister of finance, Sir John Rose, visited Washington in 1869, with a view to arranging a renewal of tariff concessions. It is thought that he even proposed a complete customs union (see 'Canadian Magazine,' March 1897). Further efforts were made by the Liberal party on their advent to power (1873). Mr. George Brown visited Washington as Canadian commissioner, acting in conjunction with Sir Edward Thornton, the British minister. They, with Mr. Hamilton Fish, secretary of state, drafted a new reciprocity treaty (June 1874). Its terms referred not only to natural products, but a number of manufactured articles,—agricultural implements, boots and shoes, cottons, iron, leather, engines, etc. Duties were to be diminished by one third each year, until a basis of free exchange was reached. The treaty was rejected by the United States Senate. Shortly after this the Conservatives returning to power (1878) adopted the high tariff schedule of the so-called "national Policy"; this and the American tariff act of 1883 rendered the chances of renewed reciprocity still more remote. But towards the close of the 80's, the question again assumed great prominence, especially in Canada. It now took the form of a movement in favor of "commercial union," advocated by Mr. Erastus Wiman, Prof. Goldwin Smith, and others. This meant the abolition of customs duties between Canada and the United States, and the erection of a common tariff. A modified form of this policy known as "unrestricted reciprocity," was adopted by the Canadian Liberals as the main issue in their unsuccessful election campaign of 1891. The term was generally understood to mean a large measure of free trade both in manufactures and products, but not of necessity a complete customs union (see address of Sir W. Laurier, Quebec, 12 Feb. 1891). Meantime in the United States Representative Butterworth introduced a bill (December 1888) in favor of complete reciprocity. Representative Hitt in 1889, presented a resolution in favor of commercial union. Neither of these measures was carried, and the McKinley Tariff (1890) considerably raised the duties on barley, peas, potatoes, and various other natural products. After their successful re-election in 1891 the Canadian Conservatives opened negotiations with Mr. Blaine, secretary of state, for renewal of partial reciprocity. The negotiations came to nothing,

Mr. Blaine refusing to consider a treaty which should include only natural products. An international convention at Saint Paul, Minn., 1893, passed a resolution in favor of "a treaty providing for the free interchange of those classes of the products, both natural and industrial, of each [nation] that are most generally in demand . . . in the markets of the other." The Wilson Tariff (1894) lowered many duties in the agricultural schedule and placed lumber on the free list, but the Dingley Tariff (1897) raised the duties on cattle, wheat, flour, etc., and put a duty on lumber of \$2.00 per 1,000 feet. Mr. Osborne Howes of the Boston Chamber of Commerce, gave evidence before the recent Industrial Commission (Report Ind. Comm., Vol. IX., 1901) in favor of adoption of reciprocity. He showed that the Canadians are, per capita, the best customers of the United States, and that the 6,000,000 people of Canada purchase from the United States more than the 60,000,000, south of the Rio Grande. The balance of trade between the two countries is strongly favorable to the United States. Such a trade should, therefore, be developed by reciprocal concessions, especially as there is a possibility that the present Canadian preferences (33⅓ per cent) in favor of British goods may develop into a commercial federation of the empire. The balance of trade for recent years is seen by the following figures:

Year	Exports from Canada to the United States	Imports for consumption into Canada from the United States
Ending June 30, 1900...	\$68,619,023	\$109,844,378
Ending June 30, 1901...	72,382,230	110,485,008
Ending June 30, 1902...	71,197,684	120,814,750
Ending June 30, 1903...	71,783,924	137,605,195

The lumber interest in the United States is strongly opposed to reciprocity. Canadian lumber would have nearer access to the markets of New England, and the Middle States than the lumber of Minnesota or Wisconsin. The bituminous coal of Nova Scotia is mined at the same cost as in Maryland and West Virginia, but the Nova Scotia mines are on the sea board, whereas the railroad haul from the States mentioned, to tidewater, costs \$1.25 a ton. Without a tariff New England would look to Nova Scotia for her supply of bituminous coal. It thus appears that at the present time New England is the territory most interested in securing reciprocity. A considerable movement in that direction is now on foot. Various public meetings in Boston and elsewhere, in the spring of 1904, passed resolutions in favor of reciprocity with Canada. In Canada on the other hand the question is at present very much in the background. The absorbing interest in the outcome of Mr. Chamberlain's recent proposals of inter-imperial preferential trade (see CANADA—BRITISH PREFERENTIAL TARIFF) naturally suspends action in other directions. See CANADA—COMMERCE, TARIFFS AND TRANSPORTATION; FREE TRADE; PROTECTION; TARIFF; UNITED STATES—HISTORY OF THE TARIFF; UNITED STATES—RECIPROCITY.

STEPHEN LEACOCK,
Lecturer in Political Science, McGill University.

CANADA — CANADIAN PACIFIC RAILWAY

Cañada, kă-nā'da, a Spanish term used to indicate a small cañon, or valley with steep rocky walls. The word was in use during the Spanish occupation of the Pacific coast and is still retained in the names of a few localities in New Mexico or California.

Canada Balsam, a pale balsam, resin, or oleoresin, obtained by incision from a Canadian tree, the American silver-fir, sometimes called the balm-of-gilead fir (*Abies balsamea*). Canada balsam is of the consistence of thin honey, drying slowly by exposure to the air into a transparent adhesive varnish. It is used to mount objects for the microscope, and for other optical purposes, its refractive power and transparency being equal to glass. Thus, when it is sought to cut thin a piece of fossil wood, or anything similar, so as to subject it in favorable circumstances to microscopic examination, it is affixed to a more massive body by Canada balsam.

Canada Goose (*Branta canadensis*), the most abundant and generally distributed wild goose of temperate North America, breeding in the northern United States and the British provinces, wintering in Mexico; an important game bird. Length about three feet; brownish gray above, ashy gray below; head, neck, bill, and feet black; a white patch extending over the chin and cheeks.

Canada Hemp, or **Indian Hemp**, a perennial herb, *Apocynum cannabinum*, of the dogbane family (*Apocynaceæ*), a native of North America. It has a strong fibre used by the Indians for twine, nets, woven fabrics, etc. See APOCYNACEÆ.

Canada Jay. See JAY.

Canada Rice, a floating grass (*Zizania aquatica*), growing in lakes and sluggish streams in Canada and the northern United States, yielding a grain that forms part of the food of the Indians, and is eaten by whites also. It is also known as wild, water, or Indian rice.

Canada Snake-root. See ASARUM.

Canada Sparrow. See SPARROW.

Canada Thistle. See THISTLE.

Canada Warbler. See WARBLER.

Canadian Copyright. See COPYRIGHT, CANADIAN.

Canadian Embroidery, a kind of embroidery formed from small pieces of snake skin, fur, etc., intermingled with flexible pieces of split porcupine quills dyed in various colors.

Canadian Literature. See LITERATURE, CANADIAN.

Canadian Pacific Railway, a railway which crosses Canada from the Atlantic to the Pacific. One of the conditions upon which British Columbia entered the Dominion of Canada was the construction of such a railway. Eventually it was completed by a syndicate of capitalists, being opened for general traffic in June 1886. The Canadian Pacific Railway Company began by building a line connecting Winnipeg, Man., with the United States. At right angles to this line it started a line east and west from Winnipeg and in the course of two or three years had a line connecting Manitoba with Lake Superior at Fort William. With this original line in the middle of the continent as a nucleus

the company extended its rails east and west, until it had a through line from Montreal on the Saint Lawrence to Vancouver on the Pacific 2,900 miles long. When this through line was opened it was announced that the Canadian Pacific Railway was completed, whereas the actual fact viewed in the light of subsequent events was that the Canadian Pacific Railway was just begun. Branches were built covering the fertile productive wheat fields in Manitoba, until at the present time the Canadian Pacific has five parallel lines in the southwestern part of that province. In the east the company acquired lines carrying it from Montreal along the north shore of the Saint Lawrence to Quebec and southwest from Montreal through the province of Ontario to Detroit. Eastward from Montreal railways were built or leased which carried the company across Maine and into New Brunswick and Nova Scotia, giving it ports on the Atlantic at St. John's and Halifax. At the west, in the mineral district of Alberta, lines have been built opening up the Slocan and Kootenay mineral districts and the coal deposits between Lethbridge and Crow's Nest. This latter line when complete will make a cut-off parallel to the main line, but just north of the international boundary. In addition to this development in Canada the company acquired control of the Minneapolis, St. Paul and Sault Ste. Marie Railway and the Duluth, South Shore and Atlantic Railway, in the United States. The Duluth, South Shore and Atlantic Railway begins at Sault Ste. Marie and runs west parallel to the south shore of Lake Superior, passing through the great Michigan copper deposits to Duluth. The Sault Ste. Marie Railway, with the same easterly terminus as the Duluth-South Shore, extends southwest to the twin cities of Minneapolis and St. Paul and then turns northwestward through Minnesota and North Dakota, and meets a branch of the main Canadian Pacific at North Portal. The total mileage of the system in 1893 was:

Canadian Pacific Railway.....	8,646 miles
Minneapolis, St. Paul and Sault Ste. Marie Railway.....	1,412 miles
Duluth, South Shore and Atlantic Railway.....	565 miles
Total of Canadian Pacific System....	10,623 miles

The traffic of the Canadian Pacific Company is as diversified as the territory which it serves. Traffic returns as shown in the reports are not compiled on the same basis as the returns made by railways in the United States; that is, the table does not show the total tonnage of each class of freight, but the following table is of interest as showing the magnitude and diversity of its traffic, and the increase for the year ending 30 June 1902, over the preceding year:

	1901.	1902.
Flour (barrels).....	3,735,873	4,921,993
Grain (bushels).....	32,927,469	52,719,706
Live stock (head).....	945,386	963,742
Lumber (feet).....	899,214,646	1,033,560,377
Manufactured articles (tons).....	1,945,386	2,288,234
All other articles (tons).....	2,206,970	2,571,136
Total tons carried.....	7,155,813	8,769,934
Earnings per ton per mile.....	0.79 cents	0.75 cents
Number of tons carried one mile in 1901.....	2,383,633.945	
Number of tons carried one mile in 1902.....	3,247,922.167	

Passenger receipts per train mile amounted to \$1.32 and freight receipts per train mile to \$1.83, which are very high averages, when the

CANADIAN RIVER — CANADIAN UNIVERSITIES

large number of branch lines with light traffic which are worked is considered.

Canadian River, a river that rises in the northeast part of New Mexico, and runs generally east through Texas and Indian Territory to the Arkansas. Its length is about 900 miles, but it is rather shallow and not important for navigation. Its largest tributary is the Rio Nutria, or North Fork of the Canadian, which runs parallel to the main stream for about 600 miles.

Canadian Series, the lower of the two series into which the rocks of the Ordovician system are divided by American geologists. It comprises the Chazy and calciferous stages, principally limestones, and grades upward into the Trenton. See ORDOVICIAN.

Canadian Soldier, a pestiferous fly which annually visits, in the months of June and July, the cities near the Canadian border in the lower lake region. It travels in swarms, dashes against the electric lights, and perishes by thousands. The same insect is known in other parts as the May-fly, water-fly, and shad-fly.

Canadian Turpentine. See CANADA BAL-SAM.

Canadian Universities. There are in Canada 15 universities, several of which have various federated and affiliated colleges. Three of them (the universities of Toronto, New Brunswick, and Manitoba) are provincial institutions. Of the rest 10 are denominational and 2 are non-denominational. The list of the universities, with their endowments, etc., is as follows:

institution dating from 1668) in 1852, being granted a royal charter defining its organization and powers. At the head of the university is the archbishop of Quebec as visitor and apostolic chancellor. The superior of the Quebec Seminary is ex-officio rector of Laval. The directors of the Quebec Seminary, and the three senior professors of each faculty form the council of the university. A bull of Pope Pius IX. (15 April 1876) gave to the university the requisite acknowledgment from the Holy See and appointed the cardinal prefect of the propaganda its protector. The direction of faith and morals is thereby placed under a council composed of the archbishops and bishops of the Province of Quebec. There are four faculties: Theology, Law, Medicine, and Arts. Appointments in the Faculty of Theology are made by the visitor, in the other faculties by the council. The academic year extends over nine months, beginning in September, and is divided into three terms. In each faculty there are granted the degrees of Bachelor, Master or Licentiate, and Doctor. The course in Theology covers four years, the lectures and examinations being held in Latin; the other courses at Laval are conducted in French. No student is admitted without a recommendation from the Roman Catholic bishop of his place of residence. In the Faculty of Law, the course covers three years, and includes instruction in Roman and civil law, civil procedure, commercial and maritime law, criminal, administrative, and international law. At the end of the course the degree of Licentiate, or of Bachelor of Laws may be awarded, according

UNIVERSITIES	Date of foundation	Endowment	Value of property owned	Income	Number of students (about)
University of King's College, Windsor, N. S.	1790	\$ 140,000	\$ 250,000	\$ 8,500	25

University of Saint Joseph's College, Saint Joseph, N. B.	1864		80,000	25,000	200

Of the above institutions Laval and McGill universities, and the universities of Toronto and of Queen's College may be considered, in respect to the number of their students, value of property, etc., as constituting the first class. Laval University, Quebec, was founded by the Seminary of Quebec (a private Roman Catholic

to excellence. The degree of Doctor (LL.D.) is obtained one year later on presentation of a thesis, publicly discussed by a board of examiners. The course in Medicine covers four years, with a primary examination at the end of the second year, and a final examination at the end of the course. The arrangements in the

CANADIAN UNIVERSITIES

Faculty of Arts resembles rather the practice of European than American colleges. The degrees B.A., B.L., and B.Sc. are given at the end of an eight-years' course, the commencement of which is quite elementary. The first six years are devoted to Classics, French, English, Mathematics: in the last two years, Philosophy and Natural Science are studied. An examination is held on the completion of each of these portions of the work. The three degrees represent merely three grades of excellence. The teaching in the arts branches is given by the various affiliated colleges (Ste. Anne, Three Rivers, Saint Hyacinthe, etc.), in different parts of the province. The university, however, offers courses in the philosophical and scientific subjects, attended by the pupils of the Quebec Seminary. The expenses of the university are paid by the Quebec Seminary. The Laval charter was granted on condition that it should remain the sole Roman Catholic university of the province. The attempt to establish a separate university at Montreal was discountenanced by the Holy See, which permitted, however (1876), the establishment of branch faculties, with identical teaching. This was confirmed by provincial legislation (1881), and the Montreal branch of Laval acquired a practical independence by a Papal brief of 1889, and by the separate incorporation of its legal and medical faculties. But the Montreal professors (except in medicine are appointed by the council at Quebec. McGill University (Montreal) originated in a private endowment by the Hon. James McGill, in 1813. It received a royal charter in 1821, and commenced the work of teaching, in arts and medicine, in 1829. McGill expected his foundation to form part of a provincial government university, a scheme which proved impracticable. It results from this, however, that the supreme authority lies with the crown. The actual control is vested in a board of 15 governors selected by co-optation with the approval of the governor-general of Canada. These appoint the principal, and together with him and the Fellows form the corporation, the highest academical body of the university. There are four faculties, Arts, Applied Science, Law, and Medicine. In Arts, and Applied Science, the undergraduate course extends over four sessions of seven and one half months each, in Law it covers three sessions of eight months each, and in Medicine four sessions of nine months each. A combined course in Arts and Medicine can be taken in six years. The Faculty of Arts has a teaching staff of 53, with 356 students (session of 1902-3). In the first two years of the course leading to the degree of B.A. the subjects are closely prescribed with but little option. In the third and fourth year there is a wide range of selection among literary and scientific subjects: students may here specialize so as to obtain honor standing in a particular study or group of studies. The degree of M.A. is given on a special examination with presentation of a thesis. The fee for under-graduates is \$61 per session, for partial students \$22 per course. Summer courses are held during May and June in the subjects of the first two years for which special fees are paid. Women are admitted to this Faculty, but to no other. In the first two years they take their lectures in the Royal Victoria College, a residential college erected and en-

dowed by Lord Strathcona and Mount Royal (1883) for the women students at McGill. In the third and fourth years complete coeducation obtains. The Faculty of Applied Science has a staff of 40, with 280 students. It enjoys special facilities owing to its exceptionally complete apparatus and equipment. It gives instruction in architecture, chemistry, surveying, civil, electrical, mechanical and mining engineering, and metallurgy. It grants the degree of B.Sc., and the higher degrees of M.Sc. (for special examination) and D.Sc. (for special research). The undergraduate yearly fee is \$175. The Faculty of Medicine has a staff of 76 with 420 students. Its clinical teaching is conducted in the Montreal General Hospital, the Royal Victoria Hospital, and the Montreal Maternity Hospital. The annual fee is \$125. Graduate courses in clinics and laboratory instruction are given during the month of June. The Faculty of Law has a teaching staff of 11 with 40 students. Students are instructed, as at Laval, in the subjects prescribed by the general council of the bar of the Province of Quebec. The annual fee is \$60. Several colleges in Montreal and elsewhere are affiliated with McGill. The Stanstead Wesleyan College (Stanstead, P. Q.), and Vancouver College (Vancouver, B. C.), are affiliated for the work of the first two years in arts: Victoria College (Victoria, B. C.), for the first year in arts. The Congregational College of Canada, the Presbyterian College, the Wesleyan College of Montreal, the Diocesan College of Montreal (Church of England), are theological institutions affiliated with McGill. The McGill Normal School (Montreal) gives pedagogic training for elementary and secondary schools and awards provincial diplomas. The university possesses a fine library building with about 100,000 volumes. The theological colleges, and the Royal Victoria College provide residential accommodation, but there is no university residence. The University of Toronto is a provincial institution, whose constitutional powers and functions are defined in the University Act (Ontario, 1901). Its only college is University College (one of the most beautiful buildings on the continent), but with the university are federated a number of denominational colleges, Victoria (Methodist), Trinity (Anglican), Knox (Presbyterian), Wycliffe (Anglican), and Saint Michael's (Roman Catholic). The supreme authority is vested in the crown, acting through the lieutenant-governor of Ontario. Annual appropriations receive his ratification. Expenditures of endowments are ratified by the legislative assembly of Ontario. The professors of the university and of University College are appointed by the crown. The property of the University and of University College is vested in a board of nine trustees, four of them dignitaries of the university acting ex-officio, and five appointed by the lieutenant-governor. The university has Faculties of Arts, Law, Applied Science, and Medicine. The course in each Faculty extends over four years. In the Faculty of Arts instruction is given partly by professors, etc., attached to the University of Toronto, partly by the professoriate of University College. The federated Victoria and Trinity colleges also instruct their students in arts in the same subjects as University College. The students in arts may take either a general course, or select one of the four-

CANADIAN UNIVERSITIES

teen honor courses (Classics, Mathematics, Modern Languages, etc.). The system favors a high degree of specialization on the part of capable students. The degree of M.A. is obtainable by special examination and presentation of a thesis one year after graduation. The degree Ph.D. is granted after two years of post-graduate work under the direction of the professoriate. The four years' course in the Faculty of Law leads to the degree of LL.B. The Faculty of Applied Science and Engineering grants degrees in Applied Science (B.A.Sc.) and in different engineering branches. The four years' course of instruction given by the Faculty of Medicine leads to the degree of M.B. To receive license to practise in Ontario students must pass the final examination prescribed by the Ontario Medical Council for which a fifth year of study is required. Clinical instruction is given at the Toronto General Hospital and other places. By the recent federation of Trinity University with the University of Toronto (in effect 1 Oct. 1904) the medical faculties of the two are now amalgamated. The university holds examinations and grants degrees in Dentistry, Pharmacy, Agriculture, Music, Pedagogy and Household Science, the preparation for which is mainly done in affiliated colleges such as the Royal College of Dental Surgeons, Ontario College of Pharmacy, etc. The number of students in 1903 attached to the University of Toronto (exclusive of theological students in federated colleges) was 2,135: of these 653 were students in Arts at University College, 300 in Arts in Victoria College, 721 in Medicine, and 402 in Applied Science. The University of Trinity College (previous to federation) had 140 students. The theological colleges are residential, and University College has a dining hall. Queen's University (Kingston, Ont.) was founded by Royal charter in 1841, its funds being raised by the Presbyterian church. For many years the university received a provincial grant of \$5,000, which, however, was withdrawn in 1868. In spite of financial and other difficulties Queen's University rose under the distinguished Principal Grant (1877-1902) to a foremost place among Canadian universities. It has now a staff of 55 with 875 students. It has Faculties of Theology, Arts, Law, Medicine, and Practical Science. It confers also the post-graduate degrees of Ph.D. and D.Sc. These degrees are given four years after the degree of M.A. An approved thesis must be submitted, but residential study is not compulsory. Women are admitted to all except the theological faculty at Queen's on an equal footing with men. The university possesses an observatory, a museum, and a library of about 37,000 volumes. Degrees in Arts are awarded on examination to extra-mural students. There is no university residence. The University of Ottawa is a Roman Catholic institution, founded by the Oblate Fathers in 1848 as the College of Bytown, and erected into a university in 1866. Unlike Laval it is an English-speaking institution, and draws a considerable number of students from the Eastern States. It offers a four years' course in theology, the degree of Bachelor of Divinity being granted at the end of the second year, that of Licentiate a year later, the final degree being Doctor of Divinity. There is a four years' course in Arts, largely classical and lit-

erary, and courses of three years in Law, and Science. The university had 500 students in 1903 with a teaching staff of 52. The University of Manitoba, established 1877, by act of the local legislature, is a provincial institution, having sole power to confer degrees in Arts, Law, and Medicine, in Manitoba. The university gives instruction only in the departments of Natural and Physical Science: in respect to other subjects it is an examining body only, with examiners but no teaching professoriate. The educational work of the university is conducted in the affiliated colleges, Saint Boniface (Roman Catholic), Saint John's (Anglican), Manitoba (Presbyterian), the Wesleyan College (Methodist), and the Manitoba Medical College, all situated in Winnipeg except the first, which is in the suburb of Saint Boniface. Degrees in Divinity are granted by the affiliated colleges. The university had 368 students in 1903. Dalhousie College (Halifax), founded in 1821, is a non-residential, non-denominational institution, having full university powers. Women are admitted on terms of equality with men. It has a staff of 30 members with 350 students, in 1903. It has Faculties in Arts, Science, and Medicine, the course in each covering four years, and in Law with a three years' course. The course in arts follows the elective system. Medical instruction is given in the Halifax Medical College. It has a library of over 12,000 volumes. McMaster University (Toronto) is a Baptist establishment, with courses in Arts and Theology. It had in 1903 a staff of 16 instructors and 200 students. The University of Saint Joseph's College (Memracook, N. B.) was established by the (Roman Catholic) Fathers of the Holy Cross for the higher education of the French population of the maritime provinces. It has Theological and Art courses, and had 200 students in 1903. The University of New Brunswick (Fredericton) was founded as a college under provincial charter and endowed with crown lands in 1800, and erected into a university in 1859. Since 1845 it has been non-sectarian. The university has Faculties in Arts, and Engineering: the course in each covers four years. There is accommodation for resident students. Women are admitted to the university. The number of students in 1903 was 134, with a staff of 9 instructors. Acadia College, a Baptist institution until recently instruction was given only in Divinity and Arts, but a course in science has just been inaugurated. The University of Mount Allison College is a Methodist institution at Sackville, N. B., with Faculties in Arts and Theology. It has also an engineering course leading to entrance to the third year in Applied Science at McGill. It covers also a part of the work required for the Dalhousie Law School. The college has a staff of 10 instructors with 125 students in 1903. Bishops College, Lennoxville, is the Anglican University of the Province of Quebec. It has a Theological and Arts Faculty with 40 students, in 1903. The University of King's College, Windsor, N. S., founded in 1790, is the oldest of Canadian universities. It is a denominational institution, connected with the Church of England. It had 25 students in 1903. The Western University (London, Ont.) is also controlled by the Church of England. In addition to a divinity school of about 20 students, it has a medical faculty and a few stu-

CANAIGRE — CANALS

dents in arts. See CANADA — HIGHER EDUCATION; CANADA — SECONDARY EDUCATION; CANADA — PRIMARY EDUCATION; CANADA — PUBLIC EDUCATION.

STEPHEN LEACOCK,
Of McGill University.

Canaigre, kăn-ă'gr, a species of dock (*Rumex hymenosepalus*) indigenous to the arid region of southern California, Arizona, New Mexico, northern Mexico, and western Texas. It is a perennial herb with tuberous roots from which a reddish or green stem rises to a height of about two feet and bears rather large leaves resembling those of other docks. The tubers, which resemble those of dahlia, have long been used locally as a source of tannin, and fairly successful attempts have been made to grow them upon a commercial scale for this purpose. Propagation is easily effected by means of the tubers, about 2,000 pounds of which are required to plant an acre. Preparation of the land and cultivation are the same as for other root crops, but harvesting is usually delayed until after the plants have become dormant. This is because the proportion of tannin to waste is greater than at the time the tops die. The season of active growth is during late winter and early summer, when the dormant season commences. The yield of roots often exceeds ten tons. For market the roots are either sliced and dried, or the tannin is extracted and concentrated. Fine leather is obtained from this kind of tannin.

Canajoharie, kăn-ă-jō-hă're, N. Y., a village in Montgomery County, 55 miles northwest of Albany and about 9 miles north of Sharon Springs, on the south bank of the Mohawk River and on the Erie Canal. The town has two banks, a library, three weekly newspapers, machine shops, flour mills, planing mills, a brewery and manufactories of trunks, carriages, refrigerators, paper bags, and gloves. In the vicinity are stone quarries. Pop. 2,000.

Canal Dover, Ohio, a city of Tuscarawas County, situated on the Tuscarawas River and the Ohio Canal, and on the Pennsylvania and other railroads. There are deposits of coal, iron, and building-stone in the vicinity. The chief industries are in iron and steel, and the manufacture of racing-sulkies, baby-carriages, roofing, etc. Pop. (1900) 5,422.

Canal Du Mide. See CANALS.

Canal Ring. See TILDEN, SAMUEL J.

Canale, Nicolo, nē-kō-lō' kă-nă'lě, Venetian admiral, who flourished in the second half of 15th century. In 1469 he was commander of the Venetian fleet at Negropont (the ancient Chalcis), and succeeded in seizing the Turkish town of Enos. The cruelties perpetrated upon the inoffensive inhabitants created great indignation at Constantinople, and Mohammed II., with a view of resenting the outrages, besieged Negropont with a force of 120,000 men, and after a violent contest expelled the Venetians. Canale, to whom this defeat was attributed, was sentenced to death by the council of ten, but at the instance of Pope Paul II. and of other influential persons, his punishment was commuted to exile for life.

Canaletto, kă-nă-lět'tō, or **Canale**, Antonio, Venetian painter: b. Venice, 18 Oct. 1697; d. there, 20 Aug. 1768. He is celebrated

for his landscapes, which are true to nature, and his architectural paintings. He is said to have first used the camera obscura for perspective.

Canaletto, Bernardo Belotti, bër năr'dō bē-lőt'tě, Venetian painter: b. 1724: d. Warsaw, 1780. He was nephew of Antonio Canaletto (q.v.), who was likewise a good artist, and painted many Italian landscapes. He lived in Dresden, where he was a member of the Academy of Painters.

Canals. Navigation canals, as distinguished from power or irrigation canals, may be classified in various ways. One is according to their magnitude, and the consequent traffic for which they are intended; as boat and barge canals, or ship canals. Or again, according to their source of supply; as pure canals, mere artificial cuts with no water but what is turned into them; tidal canals, varying with ebb and flow; and canalized rivers, with weirs to increase depth and a lock at one end, and if necessary, lateral cuts around falls or other obstructions. Or according to their geographical purpose: as isthmian canals, like those across Suez, Panama, and Corinth; peninsular, to save distance or a stormy passage, as those across Jutland, the Languedoc Canal from the Bay of Biscay to the Mediterranean, the Caledonian, the Chesapeake & Delaware (bays) across Delaware, etc.; canals around falls, as the Welland, Sault Ste. Marie, Ohio Falls, etc.; system-joining canals, as those connecting the Danube and Rhine, the Seine and Loire, Lake Erie and the Ohio or the Hudson, Lake Michigan and the Mississippi, the St. Lawrence and the Ottawa or Lake Champlain, etc.; or artificial-seaport canals, as the Manchester & Liverpool, to give inland cities access to the sea. Practically, however, the first is the only very useful one.

The chief problems in the construction and operation of a canal are: (1) To proportion its dimensions to the probable volume of traffic, in order to save interest, maintenance, and operation charges. (2) To give it the shortest and most easily constructed route, and the best lines and form, consistent with the cheapest maintenance and operation. (3) To provide and regulate a constant supply of water. (4) To shift vessels from one level to another most speedily and cheaply and with the least waste of water. (5) To gain the maximum of speed with the least injury to the embankment.

1. American and English barge canals have very largely gone out of use since the advent of railroads; and it is agreed that a principal reason is the small cargo they can float, making the expense of freightage heavy in proportion. As the operating expense of canals with thrice the carrying capacity is less than half as much again, it is certain that with enlarged size and a full business a great reduction in freight rates would be possible. But the latter clause is the dubious part: if the traffic were not commensurate, the added expense would still further handicap them as business ventures. It is therefore a very nice question exactly how large to make a canal; and has hitherto proven insoluble, except to large communities, which can afford to sink a part of the expense in the general "plant" of their industrial appliances.

2. A canal cannot, like a highroad or a railroad, have "grades." Each level must be absolute until a new one is established; and it

CANALS

must follow hills and valleys as it finds them, tunnel the former and build aqueducts across the latter or the river-courses, and change levels when needed. But locks are expensive both to build and operate, and delay traffic; the fewer the better on all grounds. It is therefore often thought cheaper in the long run, and a saving of time in transit, to take a longer route and save locks. The soil is also to be considered: rock or hardpan costs more to excavate, and a longer route may furnish cheaper cutting. On the other hand, in hard ground, the cut can be more nearly vertical and less excavation be needed. In soft ground the sides must have a heavy slope or they will cave, so that the top may be from two to two and a half times as wide as the bottom; in all ordinary ground some slope is needed; in rock cutting the sides are nearly or quite vertical, as also in passing through towns, where the sides are of masonry and space is a desideratum. The question of route is therefore anything but a simple one, and is complicated with many business and mechanical ones. The number of bridges, aqueducts, culverts, etc., to be built is an important consideration. The width must be sufficient to allow two of the largest vessels to pass abreast without fouling, and the narrower the way the more traction power is needed. The width of bottom is usually fixed at the beam width of two vessels, and the depth at 18 inches more than their draft. The excavation of canals is carried on like other large excavations, with machinery from the ordinary pick and shovel, scraper, and cart, to great steam excavators and dredges, powder and dynamite for rock blasting, and portable railroads for carrying off the material excavated, etc. Aqueducts have always masonry foundations or piers, supporting a trough of masonry, wood, or steel. When the interfering stream is small, it is carried under the canal by a culvert.

3. The provision of a supply of water might well be placed first, as the canal would be useless without it. If possible, the location is chosen so as to fill its summit levels from sufficient lakes or streams. Otherwise artificial reservoirs must be constructed, with all the care needed for the water supply of towns except as to quality. The drainage basin must be ample to supply loss of water by evaporation, leakage, and lockage, with reference to length of canal, number and size of locks, and volume of traffic; and the feeders properly calculated as to length and size. When an elevated supply is not to be had, pumping works take their place. Of the causes of wastage mentioned above, evaporation cannot be lessened. Leakage is prevented in porous soil by cementing or puddling the sides of the canal. But lockage is the constant drain on the supply, which has exercised much ingenuity in minimizing. One method of preventing waste is also connected with the regulation of overflow: to keep a "ladder" of locks far enough apart, say 100 yards, so that the discharge from upper to lower level shall not overspill: or an intervening pond must be formed. As overflow not only wastes, but may cause heavy damages and suits, and also injures the towpath, waste-weirs should be provided at convenient distances; and as a break would drain the entire reach before it could be repaired, these must be localized by stop-gates at short distances, making only a small basin to

waste and do damage with its water. The towpath must also be so sloped and prepared as to prevent its soaking and miring or crumbling.

4. The lock is the chief agency for shifting boats from one level to another. Its principle is to open a small basin with one closed end into a larger one, thus raising or lowering the water of the smaller to the level of the larger without much affecting the latter. In practice, the lock is a chamber with its sides at the upper level and its bottom at the lower; and to save water, it is made as nearly as possible the size of the largest vessel that is to use it, with six inches to a foot of play at each side and end. The lateral walls in the more important canals are of stone. The ends are wooden or iron folding gates, opening up-stream; each made of two leaves pivoted in the walls, each leaf a little more than half the width of the lock, so that they shut together at an obtuse angle against the current, the weight therefore only serving to close them still tighter. When a vessel is to be brought from one level to the other, it is floated into the basin or "pound," and the gate shut behind it. A sluice or valve in the upper gate then admits water and slowly raises it to the upper level, or the one in the lower gate lets it down to the lower level, as the case may be. The total lockage takes all the way from 6 to 20 minutes. These sluices are worked by rack and pinion in the gate, or revolve on an axis; they are managed by long levers set in the top of the gate, and reached by a "running board" projecting over it. The gates themselves are also managed by levers except in the better equipped and important ones, where they are often worked by steam machinery, at a saving of half the time. To save time and expense of superintendence, the reaches are made as long as possible, and the locks bunched in one spot in "ladders" of several close together, like a flight of steps, with a high lift, rather than scattered along the route. As said above, these should be some way apart to prevent overflow. As the pressure on the gates and sides is very great, the limit of "lift" in a lock, or the vertical height to which the water is raised, averages not over eight or nine feet, and may be only three or four; though 12 is not very uncommon, and 18 has been attained at the Sault Ste Marie. On the largest locks the water is admitted through a culvert parallel to the side wall of the lock, and opening into the centre through a tunnel; this is said to reduce the time of lockage considerably. Of course too sudden an admission of water would injure the boat. Pipes are also used.

It is evident that at each passage of a boat, the upper level has to supply water enough to fill the lock between it and the lower. It may be noted that the ascending traffic takes far more than the descending, because in the latter case the water displaced by the boat itself flows back into the upper reach, and remains there after the gates are shut. A 25-ton boat with an eight-foot lift costs 163 tons of water going up and 103 coming down. To economize this supply where water is scarce, two chief plans have been devised. One is to form at the side of the lock a reservoir equal in size. When the lock is to be emptied, the water is run into the reservoir until it and the lock are at the same level which of course will be half height. The reservoir is then closed, and the remaining water in

CANALS

the lock run off through the lower sluices in the usual way. On refilling the lock, before opening the upper sluices, one fourth the quantity required can be obtained from the reservoir, thus saving 25 to 40 tons of water at each passage. This delays the traffic, however, and has not been much used. Another method is now coming into use in the canals of largest traffic, at the spots where a number of locks are bunched, and therefore a great amount of water used and time consumed. This is a reversion to the oldest historic type, of lifting the boats by machinery instead of floating them up; except that instead of inclined planes for hauling up and gravity for letting them down, hydraulic vertical lift locks are used. In this system the lock is a chamber with gates and water, as in the other; but it is movable, and when the boat is run into it, is raised or lowered to level. Counterweights and flotation tanks are sometimes used to aid the hydraulic power. The first of these was built at Anderton on the Weaver River, England, in 1876; lift, 50 feet 4 inches; two troughs 75 by 15 by 5; hydraulic ram, with three-foot plunger. This lets through a 100-ton boat in a total lockage time of eight minutes, and takes the place of six ordinary locks, which would take at least an hour, and on an average considerably more. The next was at Les Fontinettes, northwest France, on the Neufossé Canal, connecting the North Sea ports with Paris; lift, 43 feet 1 inch; two troughs 139 feet 7 inches by 18 feet $4\frac{1}{2}$ inches by 6 feet $10\frac{5}{8}$ inches; hydraulic ram, 6 feet $6\frac{3}{4}$ inches plunger. This lets through a 300-ton boat in 20 minutes, and replaces five locks taking two hours. At La Louvière, Belgium, on the Canal du Centre, connecting Mons with Brussels, there is a fall of 203 feet in 17 miles, and 213 of it in five miles. This has been overcome by five lifts, with hydraulic rams having plungers of 6 feet $6\frac{3}{4}$ inches, operated by turbines turned by the upper-level water; height of lift from $50\frac{1}{2}$ to $63\frac{3}{4}$ feet. Each of these has two troughs of 141 feet 1 inch by 19 feet $\frac{1}{4}$ inch by 8 feet 6 inches, and takes up 400-ton barges in 15 minutes. At Lockport, N. Y., on the Erie Canal, the original nine and later five double locks, with a lift of 54 feet 5 inches, have been replaced by a hydraulic balance, working two troughs 225 feet by 19 feet 2 inches by 9 feet, and raising 400-ton boats in 15 minutes of lockage, against half an hour to an hour and a half of old. Others are either built or building.

5. The maximum of speed thus far found compatible with safety and economy on canals is from three and a half to four miles. Higher speed not only involves much greater proportionate power for traction on account of the resistance in a narrow way, but injures the embankment by the wash of the waves. Even on a navigable small river, a steamer at eight or nine miles an hour will cut the banks badly; and it would destroy those of a canal, unless faced more solidly than is commercially practicable. Furthermore, if the canal were worked to its full capacity, the traffic would not be expedited unless lockage could be shortened. The question of power for hauling the boats has been variously solved. Sometimes men draw the boats by ropes from the towpath, sometimes they row the boats direct,—this mostly in China; most often animals on the towpath draw them with ropes, singly or in tows; sometimes loco-

motives replace the animals, and in one place (the Muscle Shoals Canal on the Tennessee) the locomotives exchange boats when they meet; on the Erie and the Delaware & Raritan, steam propellers are used; in still others, especially on the continent of Europe, the power is from a cable or an endless chain along the bottom of the canal, either gripped by the boat or wound over a drum on the bottom of the boat.

Historical.—The earliest artificial water channels were for irrigation and drainage; not to reclaim swamp land, other soil being too plentiful, but to regulate the overflow of rivers. These date from an immemorial past, certainly 3500 B.C. in Babylonia and Egypt, more probably 7000 at least. Very early also the larger ones must have been used for boat navigation, to transport agricultural and building materials; these combined drains and canals still exist in England, called "navigations," and the workers on them "navigators," and have given to the language the word "navvy" for construction laborers. At what period the first ones were dug primarily for navigation, and incidentally for irrigation, cannot be told. There is a tradition that the Suez Canal was dug under the Old Kingdom of Egypt before 2000 B.C.; it was certainly opened or reopened for small boats by Necho, about 600 B.C. About this time also Nebuchadrezzar of Babylon opened the Royal Canal between the Tigris and Euphrates, but Mesopotamia had been well canalized before. These two countries, indeed, invited canals, with their flat surface and long levels, and easy digging in sand or clay. It is probable that China also had canals before the Christian era, but evidence is wanting. The first canals were of course on one level; but with the light boats and great engineering skill of the ancients the step was not long to damming the water at different levels and hauling the boat over. The first system, not yet disused, was to pull the boat up an inclined plane and let it down by gravity; and this remained the only available method till modern times. Under Alexander and his successors in Egypt and the Seleucid empire, canals were much used: an important one was from Alexandria to the Nile, whose mouths were shut off by sandbars. Marius had one constructed 102 B.C. from the lower Rhone to the Mediterranean. Under Claudius there was one from the Tiber to the sea; and in Great Britain there are two which date from the Roman time, the Foss Dyke and the Caer Dyke, in Lincolnshire, of 40 and 11 miles respectively. In the 4th century Lombardy was canalized,—a very favorable spot from its great plain and many rivers; and near the end of the 5th century, Odoacer carried one from the Adriatic to Mentone above Ravenna. The downfall of Roman civilization stopped their development for a while; but under Charlemagne a fresh extension began, that monarch building canals to connect the Danube both with the Rhine and the Black Sea. In the Netherlands bogs the system is that of nature itself, and began very early; here the canal is not so much an artificial channel as a remnant of the original sea, around which the land is built. In Britain as early as 1121, Henry I. deepened and made navigable the old Foss Dyke. The Grand Canal of China, about 1,000 miles long, a large part of it made up of canalized rivers, was completed

CANALS

in 1289. That country has many other great systems connecting its internal waterways.

But obviously the boats transferable by such machinery must be small and lightly loaded; and the modern canal system, with long heavy boats and large cargoes, was first made possible by the invention of the lock. This doubtless developed out of putting dams close together with gates in them; but neither inventor nor even country of first use is certain. It has been claimed for two brothers, engineers of Viterbo in Italy, in 1481; also for Leonardo da Vinci the universal genius; and again for Holland a century earlier. The one certain fact is, that in the latter part of the 15th century they were in use in both countries, and spread rapidly through Europe. The first country to undertake on a large and systematic scale the connection of its leading systems by canals was France, in the 17th century. The Brière Canal, connecting the Seine and Loire, was begun in 1605 under Henry IV., and completed 1642 under Louis XIII. The Orléans Canal, uniting the same basins by the Loing, was completed 1675, under Louis XIV. The greatest of all, the Languedoc Canal, to connect the Bay of Biscay with the Mediterranean, was finished 1681. It is 148 miles long, $6\frac{1}{2}$ feet deep, with a summit level of 600 feet; has about 119 locks and 50 aqueducts, and floats barges of 100 tons. France in 1879 passed a law making all its canals uniform at $6\frac{1}{2}$ feet deep, with locks $126\frac{1}{2}$ feet long by 17 wide. England was much later in taking up the system on a large scale, but when it did so, carried out a remarkable one, with great feats of engineering. The fathers of it were Francis Duke of Bridgewater and his famous engineer, James Brindley; and the beginning was the charter for the Bridgewater Canal in 1759. The names of Watt, Telford, Nimmo, Rennie, and other noted engineers are associated with it. The last inland canal in Great Britain was built in 1834. Among the leading ones are the Grand Junction, 128 miles; Leeds & Liverpool, 128; Trent & Mersey, 93; Kennet & Avon, 57. The great Irish canals are the Grand Canal, from Dublin to Ballinasloe, 164 miles, uniting the Irish Sea to the Shannon; and the Royal Canal nearly parallel to it for the same traffic, from Dublin to Torinansburg, west of Longford. The great canals of Scotland are the Caledonian and the Forth & Clyde, spoken of under *Ship Canals*. Early in the 18th century Peter the Great constructed a great system of canals and canalized rivers, 1,434 miles long, to connect St. Petersburg with the Caspian. The Danish Canal, 100 miles long, from the North Sea to the Baltic, was finished in 1785. The Gotha Canal, 280 miles long, connecting Stockholm with Gothenburg across Sweden, was planned 1716, but opened the first part 1810, the whole 1832. In 1836-46 Louis of Bavaria revived Charlemagne's old plan, connecting the Main (and so the Rhine) with the Danube, by a canal 108 miles long, 650 feet above the Main, and 270 feet above the Danube.

United States Boat Canals.—The first canal in this country was built in 1793, around the falls of the Connecticut River at South Hadley Falls, Mass.; the engineer was Benjamin Prescott of Northampton, afterward superintendent of the Springfield Armory. The lift was not by locks, but by inclined planes, the boats being run into a movable caisson, filled with water

and hauled up by cables operated by water-power; locks were introduced later. In 1796 a canal was completed around Turner's Falls farther north in the same river, at Montague. "The Proprietors of the Locks and Canals on Merrimack River" were incorporated 1792, and opened their canal around the falls at Lowell to the mouth of the Concord, one and a half miles long and with four locks, in 1797; it was for the lumbering business, rafts, masts, etc. But the first general canal for passengers and merchandise opened in the United States was the Middlesex, a rival to the last, incorporated 1793, and completed 1804 at a cost of \$700,000; it ran to Charlestown, 31 miles, was 24 feet wide and 4 feet deep, and fed by the Concord. A packet boat, the Governor Sullivan, plied regularly between Boston and Lowell, taking nearly a day. The first boat voyage to Concord, N. H., was made in 1814, and a steamer began passages in 1819. The canal was disused 1851. But much broader projects had been set on foot about the time of these local ventures; and several of the greatest afterward carried out, as well as some which have been chimeras rather from political developments than from any inherent impracticability, were broached even before the Revolution. Washington was deeply interested in canal schemes all through his life, and favored canals to connect all the great American water systems. The Potomac and Ohio, the James and Ohio, and the Mohawk Valley and Great Lakes connections, were all examined by him. The last named he looked over during the Revolution. In 1792 the Western Inland Navigation Lock Company was formed, and by 1797 had finished six miles of canals around the rapids at Little Falls, making a navigable way for 15-ton barges to Lake Ontario. Pennsylvania built several small canals in the two decades from 1790 to 1810, but they had little success. In 1784 Maryland and Virginia jointly granted a charter for a canal from Georgetown on the Potomac to the Alleghanies, under which up to 1822, when it was abandoned, some three quarters of a million dollars were spent in excavations, dams, and locks. But the great era of American canal-building, and of furious and losing canal speculation, was from 1810 to 1840; its definitive close was about 1850, since which year no boat canal has been built in this country except the Illinois and Mississippi. The entire system in the United States aggregates about 4,200 miles, nearly all in the belt from New York south to Virginia and west to Indiana. There are at present about 40 large canals in the United States, of which 14 are in Pennsylvania, 13 in New York, and 5 in Ohio. Some of the lines most important in their early days, and which gave great cities their start since confirmed by railroads, are now entirely disused; and a history of their fortunes would be of no more importance than of other bygone business ventures. Some of the leading existent ones, or those which may be only dormant, will be described.

Chesapeake & Ohio.—The fortunes of this system have shown how difficult it is to forecast business developments. As designed by Washington, it was to connect the Chesapeake and ocean navigation, by way of the Potomac, with that of the Ohio, by portages and high-roads from its terminus Cumberland at the foot of the Alleghanies; as a fact, its use has been

CANALS

mainly from the accidental fact that Cumberland is near the Pennsylvania coal fields. The fortunes of the first company have been described. In 1823 commissioners appointed by Maryland and Virginia reported in favor of a new route in place of attempting to complete the old one; in 1824 the national system of internal improvements was inaugurated by act of 30 April, and a board of engineers in October 1826 reported on a canal from Georgetown to Pittsburg. As the cost was over \$22,000,000, it was considered prohibitory then; and in 1829 the "eastern division" to Cumberland was authorized, by national, State, municipal, and private stock subscriptions. But the work had been inaugurated on 4 July 1828 by President J. Q. Adams, who struck the first spade; and it was fully opened in 1850. It is 18½ miles long and 6 feet deep, 60 feet wide from Georgetown to Harper's Ferry, and 70 on an average from thence to Cumberland. It is fed from the Potomac by seven dams. The aqueduct at Georgetown over the Potomac was a very considerable engineering feat for its time; it rests on 12 masonry piers constructed by coffer-dams on rock 28 to 40 feet below the surface. At Paw Paw Bend, 27 miles east of Cumberland, the canal saves six miles by a cut-off and tunnel through the mountain, 3,118 feet long. The summit level is 613¾ feet above tidewater; the rise is accomplished by 74 locks from 6 to 10 feet lift. The whole work had cost over \$9,500,000 when opened, and its total capitalized outlay had been over \$15,000,000 when the bondholders foreclosed in 1890.

Erie Canal.—The State of New York finally bought the works of the Western Inland, above mentioned. In 1803 Gouverneur Morris suggested or re-suggested a broader plan, to make a navigable way not to Ontario but to Erie, and therefore from the new West to New York. De Witt Clinton eagerly took up the idea, threw his whole energies into pushing it, and made it a foremost part of his political programme, bitterly opposed by the Tammany and Van Buren wing. In 1808 Simeon De Witt was appointed to survey the Mohawk route. On 3 March 1810 a commission was appointed, with Gouverneur Morris at the head and Clinton a member; it made several reports urging the feasibility and business advantage of the canal, and Clinton's memorial to the legislature in 1815 is said to have carried conviction. At any rate, on 7 April 1816 an act was passed authorizing the construction of the Erie and Champlain canals; on 4 July 1817 the first ground was broken, at Rome; and on 4 Nov. 1825, during Clinton's governorship, the canal was formally opened from Albany to Buffalo, 352 miles. It had cost \$7,602,000, but it reduced the freightage time between the termini from 20 days to 10, and the passenger time shortly to 3½, by a line of light packet boats with relays of horses at a trot; and reduced freights at once from \$100 a ton to \$10, and then to \$3. It made central New York, largely uninhabited, at once a district of potential empire with settlers flocking in; secured for New York the domination of the American seaboard; and created or solidified the prosperity of the remarkable line of cities in its path. Its construction was justly considered a triumph of engineering ability; several of the stone aqueducts by which it was carried over the streams (it crosses the Mohawk twice) presented pecu-

liar difficulties, and in places it was cut through solid rock. It was at first 40 feet wide and 4 feet deep; later enlarged to 70 feet at top, 56 at bottom, and 7 feet deep; still further deepened as below. It has 72 locks, 110 by 18, 57 of them double. The chief lifts are at West Troy, 188½ feet, surmounted by 16 double lift-locks; at Lockport, 54½ feet, at first by nine double locks, then by five higher ones, since 1895 by a hydraulic balance lift (above described); and at Albany, 20 feet. It is fed from Lake Erie, the Black River, and several lakes in its course. The total rise to Buffalo is 568 feet, which means that the general fall of water is to the eastward. After the New York Central paralleled it, the business declined, and for many years after the war seemed doomed to extinction. In 1883 all tolls were removed on the State's canals, and the navigation made free; but even this did not wholly arrest the decline, due to reasons heretofore stated. It being evident that the Erie must be enlarged to be an effective competitor of the railroads, in 1896 a referendum was taken on an expenditure of \$9,000,000 for deepening it to nine feet. In little more than a year from the time that work was begun, this money was exhausted, and the task but partly completed. Elaborate plans were devised for turning it into a great barge canal, navigable for vessels of 800 to 1,000 tons. It has been officially estimated that this will cost \$101,000,000, or \$40,000,000 more than all the outlays upon the canal to date. The proposition was presented to the people in November 1903, and was carried by a popular majority of 250,000 votes.

Illinois & Michigan Canal.—This route connects the Mississippi system with the Great Lakes, and by the Welland Canal with the St. Lawrence. Its inevitability was plain by reason of the extensive use of the Chicago portage (from the Chicago River to the head-waters of the Kankakee, an affluent of the Illinois) by the Indians and trappers, it being only half a mile for boats, the shortest important portage on the continent. Chicago was one of the best trodden sites in America before white men came here. As early as 1822 Congress granted a right of way for such a canal, and in 1827 and 1854 made further grants. For some reason it hung fire for many years, though a host of surveys and estimates were made by the State and the nation. Work was prosecuted on it 1836-41, then suspended till 1845, and the canal was finally opened in April 1848. It had then cost \$6,170,226. The western terminus is La Salle, at the head of steamer navigation on the Illinois River; its eastern is on the south branch of the Chicago, about five miles from its mouth in the city. The entire length is 96 miles, and the rise from La Salle to Lake Michigan is 145 feet, surmounted by 17 locks, 110 by 18; the capacity of boats is 150 tons. The original intention was to make a straight cut from Lake Michigan to the Des Plaines River, the chief branch which with the Kankakee forms the Illinois; but to save expense it was decided to use the Chicago River instead. Thence it runs to Summit on the Des Plaines, 8 miles; then 42 miles to the junction with the Kankakee; thence through the Illinois valley to La Salle. It has five navigable feeders, the Calumet, Des Plaines, Du Page, Kankakee, and Fox; and five large storage basins. The sum-

CANALS

mit level at Bridgeport required pumping for supply; and two steam engines, delivering 15,000 cubic feet of water per minute, were used till 1870. These were also used for many years to help draw off the sewage of Chicago, which empties for miles into the river. By supplying the canal from the river, the lake water was drawn in to fill the vacancy, and so kept the river comparatively sweet. But the system was expensive, and the canal was deepened for some years, ending 1870, to carry the sewage by its own flow to the Des Plaines, reversing the current of the river. It proved insufficient, and in 1892 the Chicago Drainage Canal (q.v.) was begun, which was finished in 1900. It is 40 miles long to Joliet, 22 feet minimum depth, and 162 to 290 feet wide at top. A scheme has been mooted for years, to convert this into a huge ship canal to enable ocean-going steamers to ascend from New Orleans to Chicago, and so through the Great Lakes and to the St. Lawrence; but it depends on the co-operation of the national government. Another canal to connect the Mississippi and Lake systems, which has been under construction since 1892, is the Illinois & Mississippi, the only barge canal started for over half a century. It is a supplement to the Illinois & Michigan; running from Hennepin on the Illinois River, a little beyond La Salle, to the Rock River, 50 miles, and then by 27 miles of slack-water navigation down that river to Rock Island, Ill. It is to be 80 feet wide and 7 feet deep, with 37 locks.

James River & Kanawha Canal.—This is a line partly existent and partly on paper, but interesting as probably the oldest North American canal scheme. The idea is accredited to Gov. Spotswood in 1716, when he explored the Blue Ridge; but the first active part was taken, as in all these early ventures, by Washington, who saw from his backwoods days the necessity of joining the eastern seaboard to the trans-Alleghian territory by lines of communication. He personally explored the James River route in 1784, and induced the Virginia legislature on 5 Jan. 1785 to pass an act for improving the navigation of the James. Under this the James River Company was organized, 25 Jan. 1785, with Washington as president. No work was done, and in 1835 another company of the same name took up its task; beginning the construction of the section from Richmond to Lynchburg in 1836, and completing it near the end of 1841. The second division, from Lynchburg to Buchanan on the upper James, was begun before this was opened, and completed in 1851. In 1853 an extension of 47 miles to Covington on Jackson River was begun, but the war interrupted it, and it has never been resumed. In 1874 the cost of completing it to the Kanawha, including an improvement of the navigation of that river, was estimated at \$60,000,000.

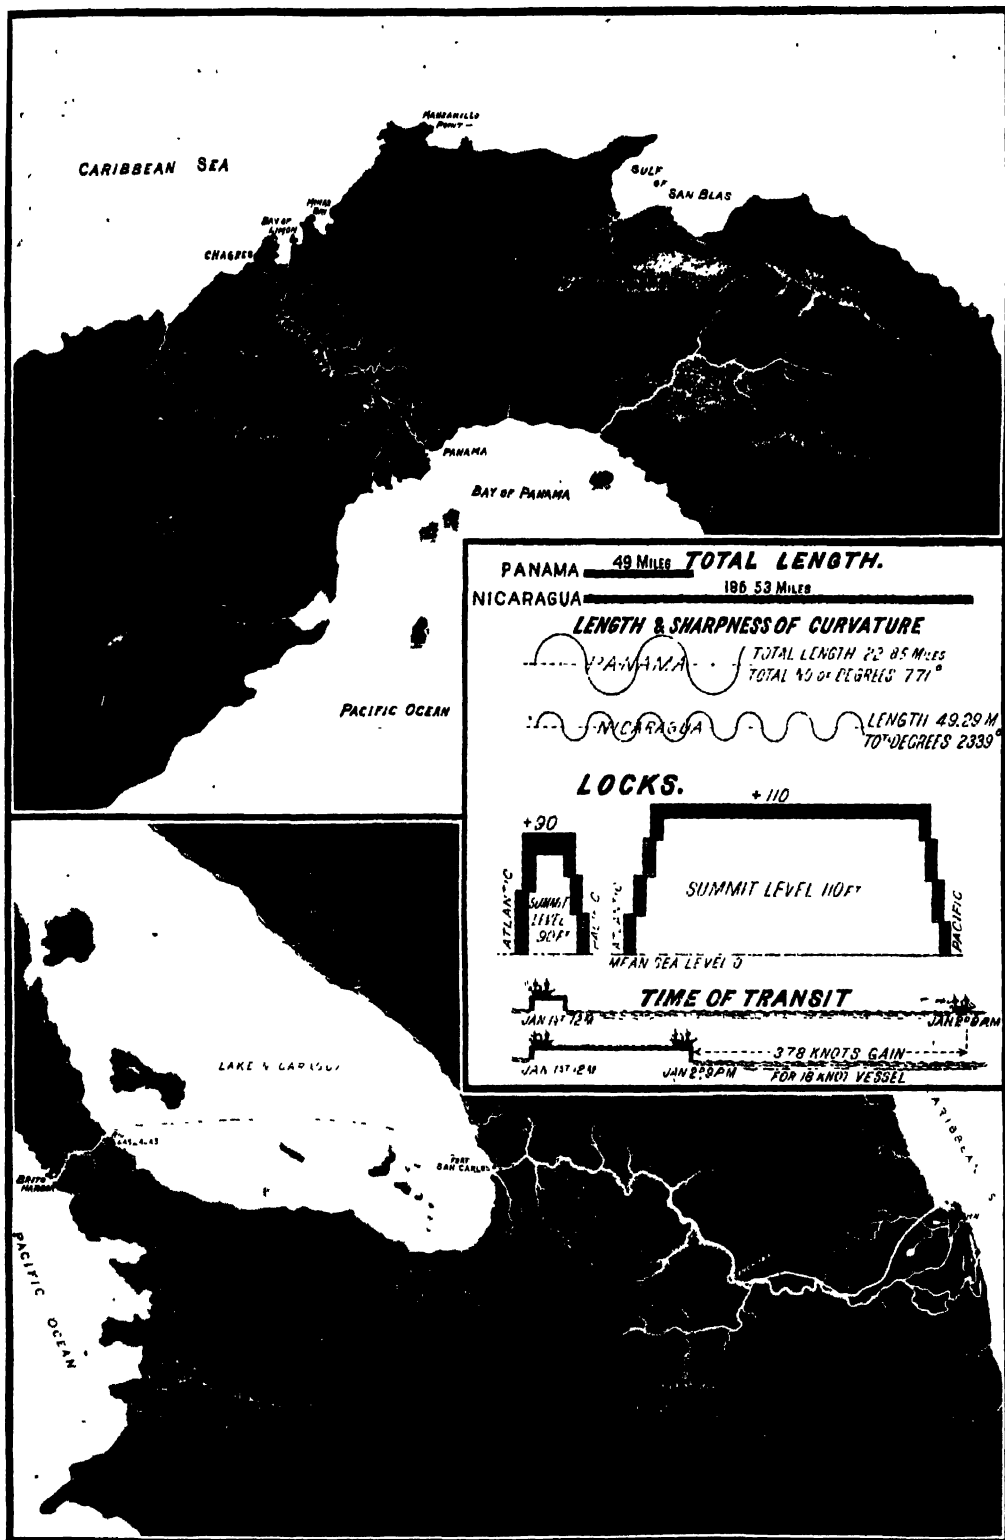

The Ohio Falls Canal.—This is a short canal, but from its location a very important one; it makes continuous navigation in one of the chief waterways of the continent. The first canal was built 1825-30, and called the Louisville & Portland. It was 17-10 miles long, 64 feet wide, had 8½ feet lift, and three locks, one at the head and two at the foot. An enlargement was begun in 1861, but interrupted by the war; in 1868 the national government included it in its river and harbor appro-

priation, and it was opened February 1873, having cost about \$4,000,000. It runs west from in front of Louisville, Ky., to Portland; is a little over 11,000 feet long and 86½ feet wide, with a minimum depth of 6 feet assured by a dam at the falls. The water in the river varies from 6 to nearly 43 feet, and earthen parapets on the sides of the canal rise to 44 feet, based on stone walls, themselves built on the limestone rock through which the canal is cut. The upper lock has been raised, the lower two left as they were, but a branch with two locks has been added. At the head are flood-gates 46 feet 11 inches high. The upper entrance is 400 feet wide.

Among others existent or of past importance are the canal between the Chesapeake and Delaware bays, across the Delaware isthmus, built 1824-9; 13½ miles long, and supplied by pumps for 10 miles of it. An enlargement has been projected. The Morris Canal, 101 miles long, built in 1830, connects the Hudson at Jersey City with the Delaware at Phillipsburg, N. J.; it is owned by the Lehigh Valley R.R. The Delaware & Raritan, 43 miles long, built 1831-4, connects those rivers, and therefore New York and Philadelphia. The Delaware & Hudson, completed 1820, was once the great coal freight route between New York and the Pennsylvania mines; its company transformed itself into the railroad company of the same name, and has abandoned the canal. The Schuylkill Coal & Navigation Company's canal is 108 miles long. The Ohio & Erie Canal from Portsmouth, Ohio, to Cleveland, and the Wabash from Toledo, Ohio, to Evansville, Ind., were once of importance in building up these sections. For the Sault Ste. Marie, see *Ship Canals* below.

Canadian Canals.—Canada has a very extended and important set of canal systems, which may be classified as follows: (1) The St. Lawrence and Great Lakes system; which includes the Welland across the neck of land to the west of Niagara Falls, carrying continuous navigation from Lake Superior to Lake Ontario, and the canals around the rapids on the St. Lawrence, between the Thousand Islands and Montreal, making unbroken passage from Duluth to the ocean. The Welland will be spoken of below. The system also comprises the Burlington Bay Canal, through a bar at the head of Lake Ontario; (2) the two Ottawa River systems, one around the falls on the river between Ottawa and Montreal, the other by the Rideau and Cataraqui rivers and the connecting Rideau Canal to the lower St. Lawrence; (3) the Lake Champlain and St. Lawrence navigation, by the St. Ours & Chambly, along the Richelieu River; (4) the Trent River system, intended to connect Ontario with Huron through the Trent, but not completed; (5) St. Peter's Canal, connecting the Bras d'Or in Cape Breton with St. Peter's Bay on the south coast. Several other very important ones are projected.

Ship Canals.—Great ship canals across isthmuses or peninsulas, to make shorter sea routes or avoid stormy passages, or surmount falls, or to make seaports of inland cities, have been the speculations of dreamers for ages; but the developed and hurried commerce of this age has made some of them imperative. The ship canals of the world are nine in number, as follows:

Panama Canal—Length, 49 Miles. Time of Transit, 11 Hours 14 Minutes.

CANALS.

SAULT STE. MARIE CANAL.

CANALS

1. The Suez Canal, begun in 1859 and completed in 1869.

2. The Cronstadt and St. Petersburg Canal, begun in 1877 and completed in 1890.

3. The Corinth Canal, begun in 1884 and completed in 1893.

4. The Manchester Ship Canal, completed in 1894.

5. The Kaiser Wilhelm Canal, connecting the Baltic and North seas, completed in 1895.

6. The Elbe and Trave Canal, connecting the North Sea and Baltic, opened in 1900.

7. The Welland Canal, connecting Lake Erie with Lake Ontario.

8 and 9. The two canals, United States and Canadian, respectively, connecting Lake Superior with Lake Huron.

The Suez Canal is usually considered the most important example of ship canals, though the number of vessels passing through it annually does not equal that passing through the canals connecting Lake Superior with the chain of Great Lakes at the south. In length, however, it exceeds any of the other great ship canals, its total length being 90 miles, of which about two thirds is through shallow lakes. The material excavated was usually sand, though in some cases strata of solid rock from 2 to 3 feet in thickness were encountered. The total excavation was about 80,000,000 cubic yards under the original plan, which gave a depth of 25 feet. In 1895 the canal was so enlarged as to give a depth of 31 feet, a width at the bottom of 108 feet and at the surface of 420 feet. The original cost was \$95,000,000, and for the canal in its present form slightly in excess of \$100,000,000. The number of vessels passing through the canal in 1870 was 486, with a gross tonnage of 654,915 tons; in 1875, 1,494 vessels, gross tonnage, 2,940,708 tons; in 1880, 2,026 vessels, gross tonnage, 4,344,519 tons; in 1890, 3,389 vessels, gross tonnage, 9,749,129 tons; in 1895, 3,434 vessels, gross tonnage, 11,833,637 tons; and in 1900, 3,441 vessels, with a gross tonnage of 13,699,237 tons. The revenue of the canal is apparently large in proportion to its cost, the Statesman's Yearbook for 1901 giving the net profits of 1899 at 54,153,660 francs, and the total amount distributed among the shareholders 51,538,028 francs or about 10 per cent of the estimated cost of \$100,000,000. The canal is without locks, being at the sea level the entire distance. The length of time occupied in passing through the canal averages about 18 hours. By the use of electric lights throughout the entire length of the canal passages are made at night with nearly equal facility to that of the day. The tolls charged are 9 francs per ton net register, "Danube measurement," which amounts to slightly more than \$2 per ton United States net measurement. Steam vessels passing through the canal are propelled by their own power.

The canal connecting the bay of Cronstadt with Saint Petersburg is described as a work of great strategic and commercial importance to Russia. The canal and sailing course in the bay of Cronstadt are about 16 miles long, the canal proper being about 6 miles and the bay channel about 10 miles, and they together extend from Cronstadt, on the Gulf of Finland, to St. Petersburg. The canal was opened in 1890 with a navigable depth of 20½ feet, the original depth having been about 9 feet; the width ranges from

220 to 350 feet. The total cost is estimated at about \$10,000,000.

The next of the great ship canals connecting bodies of salt water in the order of date of construction is the Corinth Canal, which connects the Gulf of Corinth with the Gulf of Ægina. The canal reduces the distance from Adriatic ports about 175 miles and from Mediterranean ports about 100 miles. Its length is about 4 miles, a part of which was cut through granite soft rock and the remainder through soil. There are no locks, as is also the case in both the Suez and Cronstadt canals, already described. The width of the canal is 72 feet at bottom and the depth 26¼ feet. The work was begun in 1884 and completed in 1893 at a cost of about \$5,000,000. The average tolls are 18 cents per ton and 20 cents per passenger.

The Manchester Ship Canal, which connects Manchester, England, with the Mersey River, Liverpool, and the Atlantic Ocean, was opened for traffic January 1, 1894. The length of the canal is 35½ miles, the total rise from the water level to Manchester being 60 feet, which is divided between four sets of locks, giving an average to each of 15 feet. The minimum width is 120 feet at the bottom and averages 175 feet at the water level, though in places the width is extended to 230 feet. The minimum depth is 26 feet, and the time required for navigating the canal from 5 to 8 hours. The total amount of excavation in the canal and docks was about 45,000,000 cubic yards, of which about one fourth was sandstone rock. The lock gates are operated by hydraulic power; railways and bridges crossing the route of the canal have been raised to give a height of 75 feet to vessels traversing the canal, and an ordinary canal whose route it crosses is carried across by a springing aqueduct composed of an iron caisson resting upon a pivot pier. The total cost of the canal is given at \$75,000,000.

Two canals connect the Baltic and North seas through Germany, the first, known as the Kaiser Wilhelm Canal, having been completed in 1895 and constructed largely for military and naval purposes, but proving also of great value to general mercantile traffic. Work upon the Kaiser Wilhelm Canal was begun in 1887, and completed, as above indicated, in 1895. The length of the canal is 61 miles, the terminus in the Baltic Sea being at the harbor of Kiel. The depth is 29½ feet, the width at the bottom 72 feet, and the minimum width at the surface 190 feet. The route lies chiefly through marshes and shallow lakes and along river valleys. The total excavation amounted to about 100,000,000 cubic yards, and the cost about \$40,000,000. The number of vessels passing through the canal in 1900 was 21,571, with a tonnage of 4,282,258, and the dues collected amounted to 2,133,155 marks.

Three ship canals intended to give continuous passage to vessels from the head of Lake Superior to Lake Ontario and the St. Lawrence River are the Welland Canal, originally constructed in 1833 and enlarged in 1871 and 1900; the St. Mary's Falls Canal at Sault Ste. Marie, Mich., opened in 1855 and enlarged in 1881 and 1896; and the Canadian canal at St. Marys River, opened in 1895. In point of importance, measured at least by their present use, the canals at the St. Marys River by far surpass that of the Welland Canal, the number of vessels passing

CANALETTO — CANARY

through the canals at the St. Marys River being eight times as great as the number passing through the Welland, and the tonnage of the former nearly forty times as great as that of the latter. One of the important products of the Lake Superior region, iron ore, is chiefly used in the section contiguous to Lake Erie, and a large proportion of the grain coming from Lake Superior passes from Buffalo to the Atlantic coast by way of the Erie Canal and railroads centering at Buffalo. The most important article in the westward shipments through the Sault Ste. Marie canals—coal—originates in the territory contiguous to Lake Erie. These conditions largely account for the fact that the number and tonnage of vessels passing the St. Marys River canals so greatly exceed those of the Welland Canal. The Welland Canal connects Lake Ontario and Lake Erie on the Canadian side of the river. It was constructed in 1833 and enlarged in 1871 and again in 1900. The length of the canal is 27 miles, the number of locks 25, the total rise of lockage 327 feet, and the total cost about \$25,000,000. The annual collection of tolls on freight, passengers, and vessels averages about \$225,000 and the canal is open on an average about 240 days in a year.

Canaletto (proper name BERNARDO BELOTTO), Venetian painter: b. Venice 1724; d. Warsaw 1780. He was a pupil of his uncle, Antonio Canaletto, whose style he imitated perfectly. He worked in Dresden, London, and other places, and painted principally suburban buildings and scenes. He excelled in perspective.

Canaletto, Antonio, Italian painter of perspective views: b. Venice 1697; d. there 1768. In early life he was a scene painter, but having studied in Rome he returned to his native city and became an artist of note. He is said to have been the first who used the camera obscura in painting. His principal subjects, which are highly prized, are mostly views of the palaces and canals of Venice. As he was an extremely rapid worker and very industrious, he left a great number of works. His pictures of Venetian palaces and scenery, while greatly admired by some critics, are harshly censured by others, who consider his art as mere mechanism.

Canandaigua, N. Y., a village of Ontario County, 29 miles southeast of Rochester; at the northern end of Canandaigua Lake, and on the New York C. & H. R. and Northern C. R.R.'s. It is finely situated, on high ground, with a commanding view of the lake. The fishing and boating accommodations are excellent.

Industries, etc.—The chief manufactures are those of ale, pressed brick, and anti-rust tin and enameled ware. The Lisle Tin and Enamel Works have 600 employees, the Empire Pressed-Brick Works 150, the brewery 75. The powerhouse and shops of the Rochester & Eastern Interurban Electric railway, with 100 employees, are also located here.

Public Institutions, Buildings, etc.—The churches are Congregational, Episcopalian, Methodist Episcopal, Baptist, Presbyterian, Roman Catholic, and Wesleyan Methodist. There are two banks, with a combined capital of \$200,000 and deposits of \$1,200,000. Here are also located the Thompson Memorial Hospital, the Ontario Orphan Asylum (private), a private insane asylum, and an association library.

It is also the seat of Canandaigua Academy, a public high school, and of the Granger Place School for Girls, a private secondary school.

Government.—The government is administered by a president, and a board of trustees of eight members, elected annually.

History.—Canandaigua was settled by New Englanders in 1789, and became a village in 1815. The name was originally Canandarqua, an Indian word signifying "the chosen spot."

Canandaigua Lake, N. Y., a body of water lying chiefly within the limits of Ontario County. It is 668 feet above the sea and 437 feet above Lake Ontario, and has an extreme length of 15 miles and an average width of one mile. Its outlet is the Clyde, a tributary of Seneca River. The waters abound in excellent fish.

Canani, Giovanni Battista, jō-vān'nē bāt-tēs'tā kā-nā'nē, Italian anatomist: b. 1515; d. 1597. He discovered certain of the hand muscles, and was the first to observe the use of the valves in the veins.

Cananore. See KANANUR.

Canar, kā-ñār', Ecuador, a small province situated among the Andes, between the provinces of Chimborazo and Azuay; capital, Azogues. Pop. of province, 64,000.

Canard, ka-nārd', or ka-nār', a false report; a silly rumor. The origin of this use of the term is not known. It is the French word meaning "a duck," and is thought by some to be derived from the old phrase, *Vendeur de canard a moitié*, one who half-sells a duck or cheats in such a transaction; hence a liar, a guller, etc. According to an account of wide currency in different versions, the usage arose from a story of cannibalism among a flock of ducks that ate one of their number each day until they were reduced to a single survivor, who, it was argued, had eaten all his companions. The story became common in Paris, and afterward, when any marvelous recital was heard, the listener would shrug his shoulders and exclaim, *C'est un canard!* ("That's a canard, or duck!").

Canaries. See CANARY ISLANDS.

Canarium, kăn-ā'ri-um, a genus of plants of the order *Amyridaceae*. The gum of *C. commune* has the same properties as balsam of copaiva. The nuts are eaten in the Moluccas and Java, but are apt to bring on diarrhoea. An oil is expressed from them, used at table when fresh and burned in lamps when stale.

Canary, a small, domesticated finch (*Carduelis canaria*), closely allied to the goldfinch (q.v.), and found throughout the Canary Islands, Cape Verde, and Madeira. Domestication, besides having modified the size and colors of this bird, has developed its power of song. It was introduced into Europe as a cage-bird early in the 16th century, and is now familiar in all parts of the world. Canaries in their wild state are about five inches long, and, like other finches, live mainly upon seeds, seldom eating insects. They build nests of moss and feathers in bushes and trees, often near dwellings; and their pale-blue eggs number four or five. Canaries are bought, bred, and sold in large numbers in England, Scotland, Belgium, and in the Hartz

CANARY-FLOWER — CANARY-SEED

Mountains, where their breeding forms an important household industry. The varieties are named, to a great extent, from the localities in which they are bred. Among birds valued for their beauty rather than for their power of song are: the British crested Norwich canary, the Manchester canary, which is noted for its abnormal size, it sometimes reaching a length of eight inches. The Scotch Fancy is a slender bird with long neck, its body, trunk, and tail, when in certain positions, curving into almost a half circle. The gold- and silver-spangled canaries are considered the handsomest. Their ground color is dull, spotted with gold or silver markings. The Belgian or humplack canaries are also bred for their beauty of plumage, and are remarkable by reason of the peculiar appearance they present by their broad shoulders, short neck, and small head.

Canaries bred for their power of song, and selling from \$1 to \$75, are those of the Hartz Mountains, which vary in color from a clear yellow to a bright green. The most valuable of all varieties is the South Andreasberg bird, bred solely for their power of song. Single birds are frequently utilized for the instruction of young birds, and are known as "campaninis." Other varieties are the cinnamon canaries and the cayennus, the brilliant red and scarlet of the latter being due to judicious feeding with red pepper.

Canaries are easily cared for, the only essentials being cleanliness, food, and water. The principal danger to the bird is a cold draught. The best food consists of canary-grass seed, hemp-seed, and a certain amount of greens. Acids are to be avoided, but sugar is beneficial in small quantities. Lime is essential to its welfare, and is most easily obtained in cuttle-fish bone. If their nails grow so long as to be troublesome to the bird, they should be occasionally cut with a very sharp scissors, thus running no chance of injuring the foot. Consult: Wallace, 'The Canary Book'; Belts, 'The Pleasureable Art of Breeding Pet Canaries.'

Canary-flower, an annual climbing plant (*Tropaeolum peregrinum*), of the Indian cress family, a native of New Granada, cultivated for its showy yellow flowers.

Canary-grass. See CANARY-SEED.

Canary Islands, or **Canaries**, a cluster of islands in the Atlantic, considered as belonging to Africa, the most easterly being about 150 miles from Cape Non. They are 13 in number, 7 of which are of considerable size, namely Palma, Ferro, or Hierro, Gomera, Teneriffe, Grand Canary (Gran Canaria), Fuerteventura, and Lanzarote. The other six are little more than mere rocks. The population in 1897 was 334,521, the area being about 2,808 square miles. The Canaries form a Spanish province. Lanzarote and Fuerteventura lie in the northeast of the group, Ferro is the farthest southwest. Through Ferro the first meridian used to be drawn. All are rugged and mountainous, frequently presenting deep ravines and precipitous cliffs to the sea, though having also fertile valleys and verdant slopes. The principal peaks are that of Teneriffe, 12,182 feet, and La Cruz, in Palma, 7,730 feet. Fuerteventura and Lanzarote, which are nearest the African coast, are less elevated and also less fertile than the others, and have much of an African character. Evi-

dence of volcanic action is almost everywhere present, and volcanic disturbances have taken place on some of the islands in quite modern times. The flora generally resemble that of the Mediterranean region, the trees and shrubs including the oak, chestnut, pine, cedar, laurel, heather, etc.; but there are also plants that belong to the African region, such as the dragon-tree and euphorbias. Among the fauna may be mentioned the canary, the red partridge, and several kinds of lizards; there are no snakes. The goat is the chief domestic animal. The islands are somewhat deficient in moisture and severe droughts sometimes occur; tornadoes also are not infrequent. The climate is hot on the low grounds, temperate higher up, and generally healthy. The soil where suited for cultivation readily produces all kinds of grain, fruits, and vegetables in abundance; so that the name of "Fortunate Islands," which the ancients gave the Canaries, was well deserved. Some of the islands furnish good wine, especially Teneriffe and Palma. The Canaries constitute a valuable possession of Spain, and they serve as a winter resort for invalids from colder regions. This has led to the erection of hotels specially intended for visitors, to the making or improvement of roads, and to the providing of attractions of various kinds, including golf-courses, lawn-tennis grounds, etc. There are several places of worship for English-speaking visitors. The exports at present consist chiefly of bananas, tomatoes, and potatoes, shipped in great quantities to London and Liverpool, cochineal, sugar, wine, etc. The imports chiefly consist of textiles and other manufactured goods, cereals, coals, etc. Peaches, oranges, lemons, figs, and other fruits are cultivated. Teneriffe and Grand Canary are the two chief islands. Santa Cruz, the capital of the islands (pop. about 20,000), is a port on the northeast coast of the former, which also contains La Laguna, the old capital, Orotava, and other towns or villages. Orotava is a favorite resort of foreign visitors. Las Palmas, on the northeast coast of Grand Canary, is a more important place, with its new harbor, Puerto de la Luz, between three and four miles distant, protected by a breakwater. The city is rapidly extending, its streets have been improved and lighted by electricity. Numerous steamers engaged in the trade between Europe and Africa call here, and also at Santa Cruz. Though the Canaries were known to the ancients they fell out of the knowledge of Europeans till they again became known from the 12th or 13th century onward. They were claimed by the Spaniards in the 14th century, and in 1402-5 Jean de Bethencourt, a Norman adventurer, conquered Lanzarote, Fuerteventura, Gomera, and Ferro. By the end of the 15th century the Spaniards had subdued the original inhabitants entirely; and they almost extirpated them at a later period. These early inhabitants, who are known as Guanches, had attained some progress in civilization, as shown by remains still extant. They were no doubt of Berber stock. The present inhabitants are mainly of Spanish blood, though it is said the Guanche element may still be detected. See the separate articles on Teneriffe, Grand Canary, Palma, Ferro, and Lanzarote.

Canary-seed, the seed of a plant (*Phalaris canariensis*), belonging to the order of *Gramineae*, cultivated for its seed, which is used

CANARY WINE — CANCER

principally as food for birds. In its early growth it is scarcely distinguishable from oats or wheat. With good cultivation it attains a height of three or four feet, and terminates in egg-shaped heads or ears, each containing upward of 100 seeds. The straw is of little value, either as fodder or litter, but the ears, especially when mixed with other kinds of chaff, are good food for horses. It requires a deep adhesive soil, and its produce per acre is about the same in quantity as wheat. It is a native of the Canary Islands, but is successfully cultivated elsewhere.

Canary Wine, a wine that comes from the Canary Islands, chiefly from the island of Tenerife. It is not unlike Madeira.

Canary-wood, the light orange-colored wood of *Persea indica* and *P. canariensis*, trees of the laurel family.

Canas'ter, or **Kanaster**, originally, the rush-basket in which South American tobacco was packed and exported, and hence applied to a kind of tobacco consisting of the leaves coarsely broken for smoking.

Canastota, N. Y., village in Madison County, on the Erie Canal, and on the New York C., the West Shore and the Lehigh Valley R.R.'s. It is the centre of an agricultural district and manufactures agricultural implements, gasoline engines, boats, canned goods, etc. It has two banks, public library, churches, high school and two grammar schools. Pop. (1900) 3,330.

Can'by, **Edward Richard Sprigg**, American army officer: b. Kentucky, 1817; d. 11 April 1873. He graduated at West Point in 1839; served in the Mexican war, 1846-8; commanded the United States troops in New York during the draft riots of 1863; succeeded Gen. Banks in the command of the army in Louisiana, 1864; became brigadier-general United States army, and major-general of volunteers, 1866. After the war special duties were assigned to him, and in 1869 he took command of the department of the Columbia. He was treacherously shot by an Indian chief, while negotiating for the removal of the Modocs from northern California, in the "Lava Beds."

Canby, **William Marriott**, American botanist: b. Philadelphia, Pa., 1831. He was educated privately, and though a business man, has devoted much time to the study of botany. He gathered a fine herbarium of over 30,000 species of plants, which is now owned by the New York College of Pharmacy. A smaller collection was brought together for the Delaware Society of Natural History. He was one of the botanists attached to the Northern Pacific Transcontinental Survey.

Can'can, a dance, something of the nature of a quadrille, but accompanied by violent leaps and indecorous contortions of the body. The earlier and usual meaning of the word in French is noise, racket, scandal; and is derived, oddly enough, from the Latin conjunction *quamquam*, "although"—a great squabble having arisen in the French mediæval law schools as to the pronunciation of this word.

Cancellaria, a genus of univalve *Testacea*, belonging to the family *Muricida*, and Swainson's sub-family *Scolymina*, in which the shell is turbinate, scabrous, and generally reticulated. The spire and aperture nearly equal, and the

body ventricose. Tate in 1875 estimated the known recent species at 71, and the fossil ones at 60, the latter from the Upper Chalk till now.

Cancellation, a method of abbreviating certain arithmetical and algebraic operations. When the product of several numbers is to be divided by another such product, any factors common to both products may be left out, or "cancelled." If divisor and dividend do not appear in *extenso* as products, the process of cancellation may yet be applied if common factors exist and can be detected. The work is substantially the same as that of reducing fractions to their lowest terms.

Can'cer (Lat. *cancer*, "a crab"), **Carcinus**, kâr'si-nûs (Gr. *καρκίνος*, "a crab"), or **Carcinoma**, kâr-si-no'ma (Gr. *καρκίνωμα*, "cancer"), a disease so called from its hideous appearance or on account of the enlarged veins which surround it and which the ancients compared to the claws of the crab. It is called malignant because its symptoms are so aggravated and destructive to human life.

The causes of cancer are more or less obscure, but persistent local irritation and injuries are the established causes in a large majority of the cases. Hereditary influence has usually been considered a very powerful factor in the production of the disease. The consensus of opinion is opposed to the theory that cancer is of parasitic origin. It always begins as a local disease and is essentially a new growth and composed of tissue unlike that in which it grows. It is a disease of adult life as a rule, though it is frequently found in the young. In a general way it is most likely to attack an organ that has passed through its active period of existence, as the breast or womb. The womb and stomach are the organs in which primary cancer is most frequently found, though the disease may make its appearance in any organ or tissue of the body. When the disease begins it grows rapidly; there is loss of flesh, the neighboring lymphatic glands are involved through the absorbent glands; the tissue is infiltrated; and the body is affected generally. There is more or less pain, and the tumor is composed of cells and fibrous tissue in varying amounts, with more or less white fluid.

There are several varieties of cancer:

Hard or Scirrhus Cancer, or **Carcinoma Fibrosus**.—This is the usual form seen in the female breast, on the testicle, tonsil, skin, bone, eye, rectum, or any tissue, and is more frequent in women than in men. The disease spreads, and soon takes possession of the neighboring structures by infiltrating them. In this way it becomes gradually less movable and finally fixed. No tissue is able to resist its influence, muscles, skin, fat, and bone becoming filled with cancerous deposits as the disease advances. When the glands become enlarged they may press upon nerves, causing pain, and upon veins, causing swelling. In many cases the skin over the cancer contains small hard tumors known as tubercles; these are always indicative of cancer. Sometimes the skin becomes swollen and of a brawny appearance, indicating the most rapid form of the disease. When it attacks the female breast there is generally some slight pain, and as it advances there is a depression over the growth. Soon the nipple retracts, and if let alone it will ulcerate or break down and

CANCER — CANCRUM ORIS

have an offensive discharge. This form of the disease destroys life in from three to five years.

Medullary, Encephaloid, or Soft Cancer, in which the cell elements predominate, has all the cancerous peculiarities. Medullary cancer is the form which sometimes appears as a congenital tumor, and which attacks young adults and children, and is the cancer of young life. It grows rapidly, and runs its course much sooner than the hard form. It is found most frequently about the periosteum, bones, eye, uterus, tonsil, testicle, and ovary. It is specially liable to occur about the cavities and bones of the head and face. This form of cancer is so soft that it often seems like a sac of fluid.

Epithelioma is a term applied to cancers of the skin, because the composition of the cancer is similar to the epithelial elements of the true skin. These tumors affect the skin and mucous membrane, and never originate in any other tissue. They are called local cancers by many. Epithelioma first appears as a wart or small ulcer about the lips or face. It is also found in the tongue, scrotum, throat, rectum, penis, and clitoris. It grows slowly and is not liable to return when removed.

Rodent ulcers are forms of epithelial cancer, with the exception that the cells are smaller and do not extend by the lymphatics or have any secondary deposits. They usually begin on the face as dry warts and spread very slowly. They attack healthy people as well as weak or sick ones, and appear after middle age.

Colloid or Alveolar Cancer is one in which the intercellular spaces are filled with a glairy fluid like glue or mucus. It is most frequently found in the wall of the intestines or rectum and may be seen about the angles of the jaw, or in ovary and breast.

Melanosis, or Black Cancer, is a tumor containing pigment originating from a natural tissue which contains pigment, such as a mole or the choroid of the eye. Such tumors frequently appear in groups; the coloring matter being distributed throughout the mass in varying degrees. The secondary deposits are also distinguished by the presence of pigment. It is of the soft variety and runs a rapid course.

Treatment of Cancer.—There is no subject, perhaps, in the medical and surgical world, to which so much thought has been given in the last half-century as the treatment of this most formidable and alarming disease. A few years ago, when animal therapy was introduced, many of the preparations were extensively used in the treatment of cancer, and many persons proclaimed that a new era in the management of this disease had dawned upon the world, and in a little while no one would think of such a thing as a surgical operation in a case of cancer. While it has done some good, the beneficial results have not been satisfactory up to this time. Radiotherapy and phototherapy have been introduced recently in the treatment of cancer, and there are many experiments going on at this time, and much good has been accomplished in the treatment of cancers of the skin; but as yet there are no definite conclusions drawn from the use of these two agents. Perhaps in superficial carcinoma, involving large areas, radiotherapy is preferable to all other methods of treatment. Small superficial circumscribed areas are amenable to treatment with X-rays. In many cases it is best to remove the growth

with a knife, and then follow it with the X-ray treatment. Some of those using this method say it is preferable. There seems to be some danger, in the treatment of carcinoma, of causing an inflammation which might carry the cancer cells to normal or inflamed tissue surrounding the growth. Another condition to be feared is the very great danger of burning the healthy skin. The use of the X-rays as a curative agent in the treatment of cancer of the skin is, too, in its experimental stage, and the weight of evidence is not sufficient to warrant any fixed conclusions, either for or against it, other than to say the trend of the medical mind is in its favor. Destruction by the use of caustics is a time-honored method of treatment and will continue to be employed by many. The agent used for that purpose is the chloride of zinc. The most highly scientific and satisfactory treatment for all forms of cancer, if seen early, is removal by the use of the knife. All the glands involved should be removed at the same time, as well as the neighboring ones, whether they are affected or not. Early recognition and prompt treatment are the only ways in which this disease can be cured.

Cancer, in astronomy, the fourth sign in the zodiac, marked thus ♋. The sun enters this sign on or about the 21st of June. He is at his greatest northern declination on entering the sign, and the point which he reaches is called the summer solstice, because he appears for the moment to stop in his progress northward and then to turn south again. The sun is then $23\frac{1}{2}^{\circ}$ north of the equator, and a small circle of the sphere parallel to the equator at $23\frac{1}{2}^{\circ}$ distant from it is called the Tropic of Cancer. The sun leaves this sign about the 22d of July. The constellation Cancer is no longer in the sign of Cancer. At present it occupies the place of the sign Leo.

Cancer-root, or Beech-drops, a branched parasitic plant (*Epiphegus virginianus*), of the order *Orobanchaceae*, with brownish scaly leaves, indigenous in America, growing almost exclusively on the exposed root of the beech tree. The whole plant is powerfully astringent, and the root of a brownish color, spongy, and of a very nauseous bitter taste. It has been applied more externally than internally to the cure of cancer. Other plants of the same order are also called cancer-root.

Cancrin, Georg, gā ōrg' kân-krēn', COUNT, Russian general, statesman, and financier: b. Hanau, Prussia, 8 Dec. 1874; d. Saint Petersburg, 22 Sept. 1845. He served with distinction against the French (1812-15); was minister of finance from 1823 to 1844; and wrote on military and economic subjects, his most noted work being 'Military Economy in Peace and War.'

Cancrum Oris, or Noma, gangrene of the cheek, due to bacterial infection and mostly occurring in sickly children, especially those with scarlet fever or measles. It begins as a red spot on the cheek or at the angle of the mouth, spreads rapidly, and soon eats away the whole cheek, even the bone. There is fever, and death usually results. As soon as the disease is recognized it should be freely cauterized and the parts kept bathed in antiseptic solutions.

CANDACE — CANDLE

Candace, kǎn-dā-sē, a name apparently common to the warrior queens of Ethiopia (Upper Nubia), between the Nile and the Atbara, in the later period of the kingdom of Merœ. The most distinguished of them invaded Egypt 22 B.C., was defeated by the Romans and obliged to sue for peace, which she obtained with a remission of the tribute imposed on her by Petronius. One of her successors is mentioned in Acts viii. 27; her high treasurer was baptized by Philip the Deacon on the road to Gaza.

Candahar'. See KANDAHAR.

Candaules, kǎn-dó'lēz, king of Lydia, who lost his throne and life through his besotted admiration of the beauty of the person of his queen, in 718 B.C.

Candee, Helen Churchill, American journalist: b. Brooklyn, N. Y., 1861. She is an editorial writer on the New York *Evening Mail*, and has published: 'Susan Truslow' (1900); 'How Women May Earn a Living' (1900); 'Not on the Flag' (1901); 'An Oklahoma Romance' (1902).

Candeille, Amelie Julie, ăm-ă-lē zhū-lē kǎn-dā-yē, French actress and composer: b. Paris, 31 July 1767; d. there, 4 Feb. 1834. She wrote libretto and music of the very successful operetta, 'The Beautiful Farmer.'

Candeish'. See KHANDESH.

Candela'brum, a word originally signifying candlestick, but usually denoting a support for a lamp or lamps among the Romans. The candelabra were of considerable size and often intended to stand upon the ground. They were made of wood, bronze, silver, or marble, and were often elaborately and beautifully adorned. Sometimes they had shafts in the shape of columns, which could be shortened or drawn out; sometimes the luxuriant acanthus formed a part of them; sometimes they represented trunks of trees entwined with ivy and flowers, and terminated by vases or bell-flowers at the top, for the reception of the lamps; and not infrequently the lamps were supported by figures. In ancient times Tarentum and Ægina were famous for their elegant candelabra, and Corinth also manufactured them. The Etruscan candelabra of bronze were celebrated.

Can'dia, or **Megalokastron**, Crete, a fortified seaport and capital of the island, situated on the north coast, 65 miles east of Canea. Its harbor admits only vessels of small draught. The governor and the Greek archbishop reside here. Soap is manufactured and exported. The fortifications of the city date from the time of the Venetian occupation, and in 1669, after a prolonged siege, it submitted to the Turks. Pop. estimated at 20,000.

Candia. See CRETE.

Can'didate, an applicant for an office, from the Latin *candidatus*, "white-robed," because, among the Romans, a man who solicited a public office appeared in a white garment—*toga candida*—and wore this during his candidature, which lasted for two years. In the first year the candidates delivered speeches to the people, or had them delivered by others. After this year they requested the magistrate to enter their names on the list of candidates for the office sought for. Before this was done the previous life of the candidate was subjected to

a scrutiny in the senate, after the prætor or consul had received his name. If the senate accepted him he was permitted to offer himself on the day of election as a candidate. The formula by which permission was granted was "*Rationem habebo, renuntiabo*"; if he was not accepted he received the answer, "*Rationem non habebo; non renuntiabo*." The tribunes often opposed a candidate who had been accepted by the senate. The morals of the aspirants, in the purer ages of the republic, were always severely examined. In the later period of the republic, nobody could obtain an office if he was not present and if he had not offered himself on three market days. On these days the candidates tried to insinuate themselves into the favor of the people. They went from house to house (*ambitio*, whence the word ambition), shook hands with everybody whom they met (*præsentatio*), addressed each one by his name, for which purpose they generally had a nomenclator with them, who whispered the names of those whom they met into their ear. Cicero, therefore, calls the candidates *natio officiosissima*. They placed themselves on market days in elevated places in order to be seen. On the day of election they did the same. Favorites of the people accompanied them (*deductores*); some of their suite (*divisores*) distributed money among the people, which, though prohibited, was done publicly. *Interpretes* were employed to bargain with the people, and the money was deposited in the hands of *sequestres*. Sometimes a number of candidates united into parties (*coitiones*), in order to defeat the endeavors of the others. At last the grounds on which each candidate rested his claims to the office were read, and the "tribes" delivered their votes. The successful candidate then sacrificed to the gods in the capitol. To oppose a candidate was called *ei refragari*; to support him, *suffragari*, or *suffragatores esse*. In the early Church newly baptized Christians were called candidates, on account of the white robes worn by them for a certain period after celebrating the rite. The word "candidate" is also used by Protestants to designate a theologian who, having finished his studies at a university, is waiting for an appointment in the Church.

Candide, ou **l'Optimisme**, a famous novel by Voltaire, forming an epoch in French literature. In this book he ridicules the system of optimism with his usual spirit, and attacks revelation with plausible but superficial arguments, aiming to controvert the celebrated maxim of Leibnitz, "All is for the best in the best of all possible worlds." Among the descriptions in this work, that of the carnival at Venice is notable.

Candle, a solid cylindrical rod composed of beeswax, tallow, paraffine, or some other fatty substance, with a wick running longitudinally through its centre, designed for slow combustion with illumination. The wick is generally composed of a few threads of cotton yarn lightly twisted or plaited; but formerly, in home-made candles, dried rushes (*Juncus effusus*) were employed for this purpose. The process of making rushlights is described at length by the Rev. Gilbert White in his well-known 'History of Selborne.'

Candles are mentioned in several places in the Bible, but no direct evidence is given as to

CANDLE

their form or of what they were made. There seems to be a distinction, however, between candles and lamps,—the latter specifically calling for oil, while the candle is spoken of as being lighted and placed on a candlestick.

Considerable modern improvements have been made in the manufacture of candles. One of the most important of these consists in not employing the whole of the fatty or oily substances, but in decomposing them, and then using only the stearine or stearic acid of the former, and the palmitine of the latter class of substances. The animal fats are combinations of glycerine and fatty acids, principally stearic and palmitic, both solids, and oleic acid, which is liquid. If the latter be in excess, the fat will be a liquid and constitute an oil; if, on the contrary, the solid acids predominate, we shall have a more or less concrete fat, such as the tallow of the ruminants and lard of the hog. Stearic acid now constitutes the principal raw material for the manufacture of candles. The chief chemical agents employed to obtain the stearine are caustic lime, which, setting free the glycerine, produces stearate, margarate, and oleate of lime, in the form of a solid soap; and dilute sulphuric acid, by which this solid soap, after being reduced to powder, is effectually freed of its lime. By means of a subsequent bleaching process cakes of a perfectly white color, free from impurities, and fit for the manufacture of candles, are obtained.

Candles are commonly made by dipping, molding, or rolling. The former is the older method, and consists in arranging in a frame a number of wicks of the proper length and thickness, and dipping them a number of times successively in a tank of melted tallow or other fatty composition, with intervals for the incipient forms to cool and harden. These dippings are repeated until the candles have assumed the requisite thickness and weight.

Molded candles, as their name implies, are formed in molds. These are generally made of pewter, or an alloy of 20 parts of tin and 10 of lead, though glass has also been introduced. They are hollow cylinders of the length of the

candle, and open at both ends, but provided at the upper end with a conical cap, in which there is a hole for the wick. A number of these molds are inserted in a wooden frame or trough with their heads downward; the wick is then drawn in through the top hole by means of a wire, and kept stretched and in the centre by a peculiar arrangement. The molds thus prepared are filled by running melted tallow of the proper temperature from a boiler into the trough. The candles remain in the molds for about 24 hours, but, as they improve by keeping, generally remain in

the storehouse for a few months before they are exposed for sale.

The rolling of candles is confined principally to those made of wax. Although the bleaching of wax was described by Pliny, the use of this material for the manufacture of candles dates back only to the beginning of the 4th century. From its tenacity, and the contraction which it undergoes in cooling, wax cannot be formed into candles by melting it and then running it into molds. Instead, wicks, properly cut and twisted, are suspended by a ring over a basin of liquid wax, which is poured on the tops of the wicks, and, gradually adhering, covers them. Or the wicks may be immersed, as in the case of tallow "dips." When a sufficient thickness is obtained, the candles, while hot, are placed on a smooth table kept constantly wet, and rolled upon it by means of a flat piece of wood. In this way they assume a perfectly cylindrical form. Machines have been constructed, however, for the manufacture of such products. The large wax candles used in Roman Catholic churches are merely plates of wax bent round a wick and then rolled.

For preparing wax tapers, the wick is wound around a drum and is then made to pass into the melted wax under a hook placed at the bottom of the kettle. The wick, coated with wax, traverses a draw-plate which gives it the desired diameter, and then winds around a second drum. A little tallow, resin, and turpentine is often added to the wax in order to give it greater ductility.

Wax matches, also, which are generally of paraffine, are made with the draw-plate. They are afterward cut to the proper length and tipped with a paste of inflammable material. The use of wax for candles, by reason of their cost, was never very widely diffused, and of course at the present day is likely to diminish greatly. See WAX.

Hollow candles are provided with three apertures extending throughout their entire length. They offer the advantage of not guttering when burning. They are manufactured by means of a special machine, the molds of which contain three solid rods, which are withdrawn before the solidification of the mass.

At the beginning of the 18th century, spermaceti, a product of the cachalot, or sperm whale, came largely into use for the manufacture of candles. The competition of other materials and the decline of the whale fisheries limit its use at the present day.

Cetin, a form of spermaceti, is too brittle and lamellar in texture to use alone in candle-making. These defects are corrected by the addition of about three per cent of wax.

Paraffine candles came into general use about 1850. When crude petroleum is distilled the products obtained consist of light oils employed for illuminating purposes, and heavy oils used as lubricants. These latter, upon cooling, yield a solid substance of waxy consistence and deep color, called paraffine. This material, when purified, gives a white, odorless combustible substance, which is made into candles which give a brilliant but slightly smoky flame. Objections to their use are that at the moment of extinction they emit a disagreeable odor, and that they are too fusible and apt to become distorted in a warm atmosphere. For these reasons paraffine is generally mixed with stearic

FIG. 1.—The parts of a candle flame.
a, Cold part, whence combustible gases may be extracted by means of a tube, A; b, blue part, having a higher temperature; c, luminous part.

CANDLE — CANDLE-FISH

acid. The use of paraffine candles is most common in Great Britain. See PARAFFINE.

Ozokerit, or *cérésine*, which is also used in the manufacture of candles, resembles paraffine in appearance. It is obtained by purifying a sort of natural mineral wax, the principal deposit of which is found in Galicia. It is not much used except in Germany and Austria. Since *cérésine* candles melt at a higher temperature than paraffine, they undergo no deformation when used.

Palm-oil is obtained from the west coast of Africa, especially the neighborhood of Lagos. The palm which yields it is the *Elais guineensis*, which produces a golden-yellow fruit of the size and shape of a pigeon's egg. By detaching its pulp from the kernel, bruising it into a paste, and then agitating it in boiling water, the oil is separated, and, rising to the surface, concretes as the water cools. About two thirds of it in weight consists of a peculiar white solid fat, called palmitine; the remainder is chiefly oleine.

The manufacture of candle-wicks is fully as important as the treatment of the combustible fats, and candle-makers have studied the principles of combustion with a view to discovering methods of producing the clearest light with the minimum of smoke, odor, and trouble in snuffing.

A flame is the result of the combustion of a gas. In a burning candle the fatty or other substances are melted and carried by the wick into the interior of the flame, where they are continuously converted into gas. We may compare the combustion of a candle to a microscopic gas-works, and, just as the gas-burner gives more or less light according as the pressure is varied, or the tip is more or less foul, or the proportion of air that reaches the gas is greater or less, just so a candle will give a different light according to the draft of air or the size and nature of the wick. Too large a wick would absorb the melted material too rapidly, the flame would be unduly increased, and the feeding of it would be effected under unfavorable conditions. Too small a wick would produce the opposite effect; around the periphery of the candle there would form a rim, which, no longer receiving a sufficient quantity of heat, would remain in a solid state; the cavity that serves as a reservoir for the liquefied material would become too full; and the candle would gutter. So the section of the candle, the size of the wick, and the draft of air in the flame must be apportioned in such a way that there shall always be an equilibrium between the quantity of material melted and that decomposed by the flame. The purity of the air, too, must be taken into account, for, just as a man needs pure air in order to live in health, so a candle has need of the same in order to burn well. During an evening party it may be observed that the brilliancy of the candles diminishes in measure as the air becomes impoverished in oxygen and enriched with carbonic acid.

In the flame of a candle four parts may be distinguished. The dark nucleus, *a* (Fig. 1), is formed by the gas resulting from the gasification of the combustible bodies. This gas may be ignited at the point of a glass tube, *A*, introduced into the flame. Since the air directs itself especially toward the axis of the flame,

the azure-blue part, *b*, presents a comparatively low temperature in the illuminating envelope, *c*. The oxygen but partially suffices for the combustion, while in the non-illuminating part, *d*, products of the incomplete oxidation burn in the air in excess.

The wick must be placed in the centre of the candle, or else it will remain too long, produce smoke, and darken the flame. If the end remains exactly in the centre the air will not reach it, and the wick will carbonize and form a "thief" or "waster," which, falling into the cavity at the top of the candle, will make the latter gutter, and end by obstructing the wick.

FIG. 2.

FIG. 3.

FIG. 4.

FIG. 2.—Tallow candle before snuffing. The wick becomes incrustated, and the flame becomes unsteady and smoky.

FIG. 3.—Tallow candle after snuffing. The flame is normal.

FIG. 4.—Wax candle. The wick curves, and a bead forms on its end inside the flame.

It then becomes necessary to snuff it. In order to do away with this inconvenience, Gay-Lussac and Chevreul, in 1825, recommended the use of flat or cylindrical wicks of an uneven texture, having the property of curving over. In the same year Cambacérès proposed the use of hollow plaited wicks, which, in measure as the candle burned, had the property of curving toward the white part of the flame. But ashes nevertheless formed, and, obstructing the wick, affected the light. In the month of June 1826 De Milly finally succeeded in solving the problem by impregnating the wick with boric acid. This latter, uniting with the ashes of the wick, gives rise to a fusible body, which is rejected in the form of a drop or bead toward the extremity of the wick. In Austria, wicks are impregnated with phosphate of ammonia, which gives analogous results. Balley has proposed a solution of sal-ammoniac of 2° or 3° Baumé.

Candle, Electric. See ELECTRIC LIGHTING.

Candle-fish, Oolakan, oo'la kân, Oulachon, -kôn, or Eulachon, ū'la-kôn, a sea-fish (*Thaleichthys pacificus*), of the salmon family, frequenting the northwestern shores of America, of about the size of the smelt, to which it is allied. It is converted by the Indians into a candle simply by passing the pith of a rush or a strip of the bark of the cypress-tree through it as a

CANDLE-FLY — CANDY

wick, when its extreme oiliness keeps the wick blazing. Oulachon oil, a substitute for cod-liver oil, is obtained from it. This fish is a favorite article of food in British Columbia.

Candle-fly, or **Lantern-fly**, a hemipterous insect of the group *Homoptera*, family *Fulgoridae*. The large Chinese candle-fly (*Fulgora candidaria*) is remarkable for its greatly prolonged head, which was formerly believed to be luminous. Compare LANTERN-FLY.

Candle-nut, the nut of *Aleurites triloba*, the candleberry-tree, a native of the Moluccas, Pacific islands, etc., belonging to the natural order *Euphorbiaceae*. It is about the size of a walnut, and yields an oil used for food and for lamps, while the oily kernels are also strung together and lighted as torches.

Candleberry, **Bayberry**, **Candleberry Myrtle**, **Tallow-tree**, or **Wax Myrtle**, a shrub (*Myrica cerifera*) common in North America, where candles are made from the waxy substance collected from a decoction of the fruit or berry. It grows abundantly in a wet soil, and seems to thrive particularly well in the neighborhood of the sea, nor does it ever seem to be found far inland. The berries intended for making candles are gathered late in autumn, and are thrown into a pot of boiling water, where the fatty or waxy substance floats on the top and is skimmed off. When congealed this substance is of a dirty-green color, somewhat intermediate in its nature between wax and tallow. After being again melted and refined it assumes a transparent green hue. Mixed with a proportion of tallow it forms candles, which burn better and slower than common tallow ones, and do not run so much in hot weather. They have also very little smoke and emit a rather agreeable odor. Soap and sealing-wax are also made of this substance. The plant has been cultivated in France and Germany, where it grows in the open air. Another plant belonging to the same genus is the sweet-gale (*Myrica gale*), which grows abundantly in bogs and marshes in Scotland. It is a small shrub with leaves somewhat like the myrtle or willow, of a fragrant odor and bitter taste, and yielding an essential oil by distillation. It was formerly used in the north of Europe instead of hops, and in some places it is still so used. The catkins or cones boiled in water throw up a scum resembling beeswax, which, collected in sufficient quantities, would make candles. The plant is used to tan calf-skins. Gathered in the autumn, it dyes wool a yellow color, and is thus used both in Sweden and in Wales. The dried leaves are used to scent linen and other clothes. Horses and goats eat the plant, while sheep and cows refuse it.

Can'dlemas, an ecclesiastical festival instituted by Pope Gelasius I. in 492, in commemoration of the presentation of Christ in the temple, and of the purification of the Virgin Mary. It is celebrated on 2 February, and has its name from the fact that in the Roman Catholic Church candles are blessed and carried in procession, in allusion to the words of Simeon, spoken of the infant Christ, "a light to lighten the Gentiles." See PURIFICATION.

Can'dler, **Warren A.**, American clergyman: b. Carroll County, Ga., 23 Aug. 1857. He was graduated at Emory College in 1875, and

was ordained to the Methodist ministry. He was pastor of various churches, and in 1888 was elected a bishop. He has been president of Emory College since 1888. He has written: 'History of Sunday Schools' (1880); 'Christus Auctor' (1899); etc.

Cand'lish, **Robert Smith**, Scottish clergyman: b. Edinburgh, 23 March 1806; d. Edinburgh, 19 Oct. 1873. He was educated at Glasgow University; in 1828 was licensed as a preacher, and in 1834 was transferred from Bonhill to St. George's, Edinburgh. In 1839 he threw himself into the conflict with the civil courts in the matter of the congregational right of election and independent church jurisdiction in matters spiritual, and soon became, next to Chalmers, the most prominent leader of the "non-intrusion" party and of the movement that culminated in the Disruption of 1843, and the formation of the Free Church of Scotland. From the death of Chalmers till his own death, Candlish was the ruling spirit in the Free Church. In 1862 he was made principal of the New College (the theological college of the Free Church), Edinburgh. He was the author of 'Contributions Toward the Exposition of the Book of Genesis' (1842); 'Reason and Revelation' (1859); 'The Fatherhood of God'; 'The Two Great Commandments' (1860); etc. See 'Life,' by Wilson (1880).

Candolle, **Alphonse Louis Pierre Pyramus de**, *âl-fôn's loo-è pè-är pè-rä-mü dè kan-döl*, Swiss botanist: b. Paris, 28 Oct. 1806; d. 4 April 1893. He was son of Augustin de Candolle (q.v.). He was professor of botany and director of the Botanical Garden at Geneva, published numerous works on botanical subjects, and continued his father's 'Introduction to a Natural System of the Vegetable Kingdom.'

Candolle, **Augustin** (*ô-güst-än*) **Pyramus de**, Swiss botanist: b. Geneva, 4 Feb. 1778; d. there, 9 Sept. 1841. He studied at Paris, where he made his reputation by his 'History of Succulent Plants,' and 'Essay on the Medicinal Properties of Plants.' In 1808 he took the chair of botany at Montpellier, where he replaced the artificial method of Linnæus by the natural method of Jussieu, and published the remarkable 'Elementary Theory of Botany.' After the Restoration of 1815, he returned to Geneva, where he devoted the rest of his life to his great work, 'Introduction to a Natural System of the Vegetable Kingdom,' the continuation of which he entrusted to his son, together with an herbarium of 70,000 species of plants.

Candon, *kän-dön'*, Philippines, a town of the province of Ilocos Sur, situated in the north-western part of the Island of Luzon, very near the coast. Pop. about 16,000.

Can'dour, **Mrs.**, a character in Sheridan's 'School for Scandal,' who conceals her slanderous nature under a pretense of frankness and kindness. The name is often used to denote people of such disposition.

Candy, or **Kandy**, a measure of weight in the East Indies. In Madras the candy is equal to 493 7/8 pounds, in Bombay it is 560 pounds, and in Ceylon it is equal to 500 pounds. It is divided into from 20 to 22 maunds. In Bombay there is a unit of capacity called the candy equal to 8.2 imperial bushels, and elsewhere a dry-

CANDY — CANES VENATICI

measure candy is found varying from 15 to 30 bushels.

Can'dy. See CONFECTIONERY.

Candy Ceylon. See KANDY.

Candytuft, a genus of plants (*Iberis*), of the natural order *Crucifera*, flowering in dense corymbs, and distinguished by an emarginate pouch with keeled and winged valves. It is indigenous to the countries bordering on the Mediterranean, and several species, as *Iberis umbellata*, *Iberis odorata*, and others, are cultivated in gardens.

Cane, kân, or Ken, a river in Bundelcund, British India, a tributary of the Jumna River. It follows a northeast course and is about 250 miles long.

Cane-brake, a term applied to the extensive growths of the *Arundinaria macrosperma*, the most gigantic of the grasses, which occur in the southern portions of the United States, and are to be found covering vast extents of country in the alluvial bottoms of Central and South America. The plant is not unfamiliar in the temperate zones, as its stalks are much used for fishing-rods. Cane-brakes are indicative of rich land, as they are only to be found in perfection in the most inexhaustible soils, where, having obtained a foothold, by their more rapid growth they usurp the place of the timber. In the southern portions of the United States the plant often reaches the height of 15 and 18 feet, with a base of one to one and a half inches diameter. In more southern latitudes it is very much larger. It grows as straight as an arrow from the root, tapering off finally in a beautiful, thread-like, feathery top. The leaves commence at about two thirds of the height of the plant, and seem to be attached directly to the stalk, as the branches on which they grow, save the very top ones, are not perceptible to ordinary observation. To the hunter, progress through a cane-brake is one of the most toilsome journeys that can be undertaken. Each step is disputed by the dense vegetation which rises before the intruder like a wall. In places, the cane is sometimes pressed down and interlaced, and then it becomes quite impenetrable. Under the most favorable circumstances the knife has to be freely used. Cane-brakes are often many miles in extent, always lessening in density as they reach high ground. They are favorite haunts for all kinds of game, which seek their solitudes either for protection or for the leaves for food. The deer and bear are particularly fond of the young green leaves, and upon them often become exceedingly fat. Cane-stalks being hollow, having no pith, and being divided inside every few inches into sections, they are very combustible when dried in the sun; and the air confined within the hollow sections, warming by the external heat, explodes with very considerable force, so that a cane-brake on fire gives the idea of a continued roar of distant musketry.

Cane Ridge Revival. See REVIVALS, AMERICAN.

Cane Sugar. See SUGAR AND SUGAR-MAKING.

Canea, kâ-nē'a (Greek KHANIA), Crete, the chief commercial town of the island, situated on the northwest coast, with a good harbor. It occupies the site of the ancient Cydonia, but the present town is due to the Venetians, from whom

it was wrested by the Turks, after a two years' siege in 1669. Canea is the principal mart for exporting the productions of the island. Pop. about 20,000. See CRETE.

Canella, a genus of plants belonging to the order *Guttifera*, but of which the affinities are so doubtful that it has been made the type of a distinct order, *Canellacea*. They are ornamental shrubs or trees. *C. alba*, the wild cinnamon, is a common West Indian aromatic evergreen tree, growing to a height of from 10 to 50 feet, with a straight stem branched only at the top. It is covered with a whitish bark, by which it is easily distinguished at a distance from other trees; the leaves are placed upon short foot-stalks and stand alternately. They are oblong, obtuse, entire, of a dark, shining green hue, and thick like those of the laurel. The flowers are small, seldom opening, of a violet color, and grow in clusters at the tops of the branches on divided foot-stalks. The fruit is an oblong berry containing four kidney-shaped seeds of equal size. The whole tree is very aromatic, and when in blossom perfumes the whole neighborhood. The berries, when ripe, are greedily eaten by the wild pigeons of Jamaica, and impart a peculiar flavor to their flesh. The canella of commerce is the bark of the tree freed from its outward covering and dried in the shade. It is brought to Europe in long quills, which are about three fourths of an inch in diameter, somewhat thicker than cinnamon, and both externally and internally of a whitish or light-brown hue, with a tinge of yellow. This bark is moderately warm to the taste, and aromatic and bitterish. Its smell is agreeable, and resembles that of cloves. In distillation with water it yields an essential oil of a dark-yellowish color, and of a thick tenacious consistence, with difficulty separable from the aqueous fluid. The remaining decoction, when evaporated, leaves a very bitter extract composed of resinous and gummy matter imperfectly mixed. It has been supposed to possess a considerable share of active medicinal powers, and was formerly employed as a cure in scurvy. Now it is merely esteemed as a pleasing and aromatic bitter, and as a useful adjunct in correcting more active though nauseous medicines. The powder is given along with aloes as a stimulating purgative.

Caneph'orus, a term applied to one of the bearers of the baskets containing the implements of sacrifice in the processions of the Dionysia, Panathenæa, and other ancient Grecian festivals. It was an office of honor, much coveted by the virgins of antiquity. The term is often applied to architectural figures bearing baskets on their heads, and is sometimes improperly confounded with caryatides.

Canes Venatici, kâ-nēz vē-năt'isī ("the hunting dogs"), one of the northern constellations added by Hevelius in 1690, between Boötes and Ursa Major. Coming in after the time of Bayer, it has none of his assigned letters; but Baily, in the "B. A. C." in 1845, assigned the letters *a* and *b* to the two brightest stars, and they will probably stand, though they have not been universally accepted by astronomers. The former of the two stars is a well-known double. On the maps, the two dogs, Asterion and Chara, are represented as held in leash by Boötes, and

CANETE — CANISIUS

pursuing Ursa Major and the celestial pole, but this change in the figure of Bootes has of course been made since the introduction of Canes Venatici into the celestial train. The constellation is surrounded by Ursa Major, Boötes, and Coma Berenices.

Cañete, Manuel, mā'noo-el kăn-yā'tā Spanish author: b. Seville, 6 Aug. 1822; d. 4 Nov. 1891. He was educated in Cadiz. For a long time he was an official in the ministry of the interior, and was later chamberlain to King Alfonso XII. His lyric poems, published under the title, 'Poesias,' are highly esteemed, and his dramas, also successful, include 'Un Rebate en Granada'; 'El Duque de Alba'; 'La Flor de Besalu'; and 'La Esperanza de la Patria' (with Tammayo). He is best known, however, as a dramatic critic and a writer on the history of the Spanish stage. His writings in the field of criticism had much influence in the reform of the stage, which at that time was badly corrupted. Among his other works are: 'Farsas y Eglogas de Lucas Fernandez' (1867); 'La Tragedia Llamada Josefina' (1870); 'Escritores Españoles é Hispano-Americanis' (1884); and 'Teatro Español del Siglo XVI.' (1884).

Canfield, James Hulme, American educator: b. Delaware, Ohio, 18 March 1847. He was graduated from Williams College in 1868; admitted to the Michigan bar, 1872, and practised law at St. Joseph, Mich., 1872-7. He was professor of history in the State University of Kansas, 1877-91; chancellor of the University of Nebraska, 1891-5; president of the Ohio State University, 1895-9, when he was appointed librarian of Columbia University, New York. He was secretary of the National Educational Association for five years, and its president for one. Besides numerous papers and addresses he has published: 'Taxation: Plain Talk for Plain People' (1883); 'The College Student and His Problems' (1902).

Cang, Cangué, or Kia, the wooden collar or portable pillory, weighing from 50 to 60 pounds, and fitting closely round the neck, imposed upon criminals in China. It renders the wearer unable to feed or otherwise care for himself.

Canga Arguelles, José, hō sā kăn'ga ärgwël'yēs, Spanish statesman: b. Asturias, 1770; d. 1843. In 1812 he was a member of the Cortes from Valencia, and rapidly rose to the leadership of the constitutional party; hence on the accession of Ferdinand VII. he was banished. Recalled in 1816, he became minister of finance in 1820, when the constitution was restored. Through the abolition of certain direct taxes, he caused financial disorder, and was forced to resign in 1821; was a member of the Cortes in 1822, but fled to England at the time of the revolution of 1823. Returning in 1829, he again was elected to the Cortes, where he remained true to his liberal principles. He wrote 'Memoria sobre el Credito Publico' (1820); 'Elementos de la Ciencia de Hacienda' (1825); and 'Diccionario de Hacienda' (1827-8).

Caniapuscaw, kăn-ī-äp'ūs-ka, a river in Labrador, outlet of a lake of the same name, flowing northwest into Hudson Strait; length, 400 miles.

Canicatti, ka-nē-kat'tē, Sicily, a city in the province of Girgenti, situated in a grain and fruit region. Here are also sulphur mines. The inhabitants are mostly engaged in agriculture. Pop. about 25,000.

Canic'ula, the Dog-star or Sirius (qq.v.); hence the term, "Canicular days," the dog-days (q.v.).

Canidæ, the dog tribe, comprising wolves, foxes, jackals, dogs, and the like, a family of carnivores, intermediate in structure and phylogeny between bears and hyenas. Their legs are long; the claws non-retractile, and in all except the lycaon there are five toes in front and four behind. The dentitions usually consist of three incisors, a great canine (a tooth which takes its name from its prominence in the dog, and is the seizing and tearing instrument); two small premolars, and two molars on each side of each jaw; but in the lower jaw there are three molars. All these teeth have the carnivorous characteristic of sharp-cutting crowns rather than broad, grinding surfaces, such as characterize the molar teeth of vegetable-eaters. Dogs are mainly diurnal and live in open uplands rather than in forests, where they obtain their prey by chasing it down; they occupy dens and burrows, and possess keen senses and great intelligence. See DOGS. For the fossil history of the family, see CARNIVORA.

Canid'ia, a Neapolitan woman whose real name was Gratidia, whom Horace loved, and who deserted him. Horace, in an ode, accused her of being a sorceress.

Canigou, kă-nē-goo', one of the peaks of the Pyrenees in France. It is in the department Pyrénées-Orientales, 24 miles from Perpignan; height, 9,137 feet.

Canina, Luigi, loo-ē'jē kă-nē'nā, Italian archæologist and architect: b. Casale, Piedmont, 23 Oct. 1795; d. Florence, 17 Oct. 1856. He was for some time professor of architecture at Turin, and afterward lived in Rome, where he published works of great value on the antiquities of Rome, Veii, Etruria, and Tusculum, among them 'Ancient Architecture Described and Illustrated by Monuments' (1844).

Caninde, ka-nēn'dā, a river of Brazil, flowing into the Parnahiba; length, 200 miles.

Ca'nis Major ("the greater dog"), a constellation of the southern hemisphere, remarkable as containing Sirius, the brightest star in the heavens.

Canis Minor ("the lesser dog"), a constellation in the northern hemisphere, immediately above Canis Major, the chief star in which is Procyon.

Canisius, Petrus, pā'trūs kă-nīsh'i-ūs, Dutch theologian: b. Nimeguen, 8 May 1524; d. Freiburg, Switzerland, 21 Dec. 1597. He was the first man in Germany who entered the order of the Jesuits, of which he became a very active member. In 1549 he was made professor of theology, rector and vice-chancellor of the university at Ingolstadt, and in 1551 court preacher at Vienna. He afterward reformed the University of Vienna, according to the views of the order. His catechism, which has passed through more than 400 editions, is yet in use. He persuaded Ferdinand I. to adopt stringent measures

CANISIUS COLLEGE — CANNIBALISM

against the Protestants, and founded the colleges at Prague, Augsburg, Dillingen, and Freiburg in Switzerland. He was beatified 20 Nov. 1864.

Canisius College, an educational institution in Buffalo, N. Y.; organized in 1870 under the auspices of the Roman Catholic Church; reported in 1903: Professors and instructors, 31; students, 283; volumes in the library, 24,000; value of property (including endowment) \$385,000.

Canities (Latin *Canus*, "hoary or gray-haired"), whiteness or grayness of the hair. When occurring in consequence of old age it is not a disease. Sometimes it happens suddenly, as a result of severe mental emotion.

Canitz, Friedrich Rudolf Ludwig, frēd'rih roo'dōlf lood'vig kā nīts (BARON), German poet and diplomat: b. Berlin, 27 Nov. 1654; d. there, 16 Aug. 1699. He studied law at Leyden and Leipsic, and was made state counselor in 1697 under Frederick I. of Prussia; in 1698 he was given the rank of baron. His poems were first published anonymously after his death (1700) under the title 'Nebensunde unterschiedener Gedichte'; the second edition with the name of the author appeared in 1719. They had influence on style in opposition to the mannerisms of Lohenstein and other writers of the time. Those most popular with his contemporaries are the satires and an elegy on the death of his first wife.

Canker, a disease of plants. See APPLE.

Cankerworm, a caterpillar of a geometoid moth of the genus *Anisopteryx*, destructive to fruit-trees, especially apples. See APPLE.

Canlassi, Guido, gwē'dō kān-lās'sē, Italian painter: b. near Rimini, 1601; d. Vienna, 1681. He studied under Guido Reni at Bologna, and lived at Venice as court painter under the Emperor Leopold I., and later at Vienna. He is to some extent an imitator of Guido Reni, but is especially distinguished for his use of color. His chief works, mostly biblical or mythological subjects, are in Vienna, Munich, and Dresden.

Can'na, one of the Hebrides, 12 miles southwest of Skye, and 3 miles northwest of Rum. It is four and a half miles long, one mile broad, and four and a half square miles in area. The surface, nowhere higher than 800 feet, consists of trap. A hill here of basalt, called Compass Hill, reverses the magnetic needle.

Can'na, a genus of plants, some species of which have fine flowers, and some, from their black, hard, heavy seeds, are called Indian shot. There are about 30 species in tropical America, with ornamental leaves, creeping rootstocks, and panicles of red or yellow flowers. *C. indica* is the best-known species, and *C. edulis* yields *tous-les-mois*.

Can'nabis. See HEMP.

Cannæ, kān'ē, Italy, an ancient town in Apulia, on the river Aufidus. Its site was between the modern Canosa and Barletta, famous for the great battle in which the Romans were defeated by Hannibal (216 B.C.). The Roman army under the consuls Æmilius Paulus and Terentius Varro consisted of 87,000 men, while that of the enemy amounted only to 50,000,

among whom were 10,000 horse. The battle was brought on by Varro against the better judgment of his colleague. The Romans left their strong position at Canusium on the banks of the Aufidus, and the whole army crossed the river. Varro drew up his troops on the plain, with his right wing protected by the river. At the same time Hannibal forded the Aufidus and led his small army to the attack. The battle was long, and the Romans fell in great numbers, among them the consul, Æmilius Paulus, and both the proconsuls Servilius and Atilius. Hannibal's Numidian horse destroyed those who fled from the field. The victor made 13,000 prisoners. The Romans lost, according to their own lowest statements, 45,000 men; according to the highest, 70,000. Hannibal collected the gold rings of the knights who had fallen and sent some pecks thereof to Carthage.

Can'nel Coal. See COAL.

Cannes, kán, France, a seaport and health resort on the shore of the Mediterranean, in the department of Alpes-Maritimes. It is beautifully situated in a rich fruit district, has a mild and equable climate, and attracts numerous winter visitors. There are many hotels and fine villas, charming public walks, etc. Perfumes and soap are made here. Near Cannes, 1 March 1815, Napoleon landed on his escape from Elba. Pop. about 20,000.

Cannibalism, the act or practice of eating human flesh by mankind; anthropophagy; also the eating by an animal, or animals, of a member of the same race; as, of a wounded wolf by others of the pack. In the 'Odyssey' of Homer we have the story of Polyphemus devouring human flesh; and in Herodotus, the Massagetæ (i. 216) are said to eat their aged parents. The Padæi of India (Herodotus iii. 99) were in the habit of killing and eating their relations when they fell ill. Modern facts, the truth of which is put beyond all doubt, confirm the statements of Herodotus. Among the ancient Tupis of Brazil, when the *pajé* (chief) despaired of a sick man's recovery, he was by his advice put to death and devoured. Herodotus (iv. 26) also says that among the Issedones, when a man's father dies, his relations come and help to eat the dead man, whose flesh they render more palatable by mixing it with that of some animal.

In the Middle Ages these stories were wonderfully enlarged, and people who had not yet embraced Christianity were pretty generally set down as anthropophagi. When the Lombards invaded Italy at the end of the 6th century it was reported of them that they ate human flesh; and a century later the same aspersions were cast on the Slavonian tribes. It became the fashion to bandy the accusation between enemies: thus, during the Crusades, the Saracens said the Christians ate human flesh as well as the unclean flesh of swine; while the Christians on their side maintained that the Saracens ate men, women, and children, and were particularly fond of a sucking Christian babe torn fresh from the breast of its mother. The old travelers' narratives abound in stories of cannibalism, which we may almost invariably pronounce to be false. Few persons would now credit that the Indians and Chinese sold human flesh in the market, or that the Grand Khan of Tartary fattened his astronomers and magicians with the carcasses of condemned criminals; but the

CANNIFF — CANNING

statements of Marco Polo regarding the Battas, a people of Sumatra, have been confirmed.

When America was discovered, cannibalism was found to prevail to a very great extent, and as late as the year 1866 it is well known that two Brazilian officers exploring the Pachitea River were eaten by the natives. The practice was also common in Malaysia and Polynesia,—the case of Capt. Cook in the Sandwich Islands is well known. In many parts of Africa cannibalism is systematically practised; human flesh being regarded as a great delicacy, and even preferred to every other kind of food.

Cannibalism has been ascribed to various causes—to hunger, desire for revenge, and to various superstitions. Among the latter is the belief that the spirit of a brave enemy would pass into the body of the eater and thereby strengthen him for battle. More especially is this the case in regard to eating the heart. The former cannibals of the Sandwich and other Polynesian islands used to give to a human body destined to be eaten the equivocal term "long pig."

Cannibalism has been practised by members of civilized nations from time immemorial, when in dire distress from want of food. Travelers in desert lands and shipwrecked sailors have often resorted to this method of preserving the lives of many at the expense of the few, and perhaps as a general rule this has been done by mutual agreement to abide the hazard of a lottery to decide who should be the victim. Despite such agreement, the killing of a comrade in this manner is generally held to be murder and punishable accordingly. Several years ago, the survivors of the shipwreck of a British vessel resorted to this plan. They were subsequently rescued, and on their return to England were tried for murder, convicted, and sentenced to death. This sentence was afterward commuted to imprisonment, and later the prisoners were pardoned.

Canniff, William, Canadian physician: b. Thurlow, near Belleville, Ontario, 1830. He was educated at Victoria College, Cobourg, and studied medicine in Toronto, New York, and London, England, where he took the degree of M.R.C.S. He served in the Crimean war, 1856; returned to Canada, became professor of surgery in Victoria College; visited the Washington hospitals during the Civil War, and finally settled in the practice of his profession at Toronto. He was one of the originators of the "Canada First" movement. Besides many periodical articles, he has written 'Manual of the Principles of Surgery, Based on Pathology' (1866); 'The Medical Profession in Upper Canada, 1783-1850: An Historical Narrative' (1894); 'The Settlement of Upper Canada.'

Can'ning, Albert Stratford, English writer: b. 24 Aug. 1832. He is the second son of the first Baron Garvagh. He has been a prolific writer, and among his works may be mentioned 'Christian Toleration' (1874); 'Intolerance Among Christians' (1876); 'Religious Strife in British History' (1878); 'British Rule and Modern Politics' (1898); 'British Power and Thought' (1901).

Canning, Charles John (EARL), English statesman, son of George Canning (q.v.): b. near London, 14 Dec. 1812; d. London, 17 June 1862. He was educated at Eton and Oxford.

He entered Parliament in 1836 as member for Warwick, and in the following year succeeded to the peerage, on his mother's death, as Viscount Canning. In 1841 he was appointed under-secretary of state for foreign affairs in Peel's government, and in 1846 commissioner of woods and forests. In the Aberdeen ministry of 1853, and under Palmerston in 1855, he held the postmaster-generalship, and in 1856 went out to India as governor-general. Throughout the mutiny he showed a fine coolness and clear-headedness, and though his carefully pondered decisions were sometimes lacking in promptness, yet his admirable moderation did much to re-establish the British empire in India. In 1858, when the government of India was transferred from the East India Company to the Crown, Canning became the first viceroy; and in the succeeding year he was raised to the rank of earl. From that time till his retirement in March 1862, the arduous task of undoing the mischief wrought by the mutiny devolved upon him, and his great success was a witness to his ability. See Cunningham, 'Earl Canning' (1891).

Canning, George, English orator and statesman: b. London, 11 April 1770; d. Chiswick, 8 Aug. 1827. His father offended his family by marrying a lady of beauty and accomplishments, but without fortune, and died in 1771, leaving her destitute. She however lived to see the success of her son, from whom she ever received the tenderest marks of filial love. Canning, who had inherited a small estate in Ireland, was educated at Eton. In 1787 he was entered at Oxford. His vacations were passed with Sheridan, by whom he was introduced to Burke, Fox, and other distinguished Whigs. But although Sheridan had already announced him in Parliament as the future ornament of his party, Canning entered into terms with Pitt, by whom he was brought into Parliament in 1793. During the first session he remained silent. In 1796 he was under-secretary of state. In 1797 he projected, with some friends, the 'Anti-Jacobin,' of which Gifford was appointed editor. Canning contributed many poetical and other articles to this periodical, the happiest of his efforts in this direction being the 'Needy Knife-grinder.' In 1798 he supported Wilberforce's motion for the abolition of the slave-trade. In July 1800 Canning increased his fortune and influence by a marriage with Joanna, daughter of Gen. Scott, a lady with a large fortune. The administration being dissolved in 1801, Canning became a member of the opposition until the restoration of Pitt in 1804. In 1807 he was appointed secretary of state for foreign affairs, in the Portland administration. A political misunderstanding with Lord Castlereagh led to a duel between that minister and Canning, in which the latter was slightly wounded. This dispute occasioned the dissolution of the ministry. In 1810 he opposed the reference of the Roman Catholic claims to the committee of the whole House, on the ground that no security or engagement had been offered by the Roman Catholics. Some of his most brilliant speeches were on this subject. The adoption of the measure being a matter of policy, the state of opinion, the condition of affairs, and the securities with which it should be accompanied, were with him elements of the question. He pro-

CANNING

posed securities in 1813, which, with the bill, were rejected. He supported in 1812 and 1813 the same motion which he had opposed in 1810. To Canning was principally owing the first blow which shook the throne of Napoleon: the British policy in Spain was directed and animated by him. In 1812 he was elected member for Liverpool, from which he was also returned in 1814, 1818, 1820. In 1814 he was appointed minister to Portugal, and remained abroad about two years. In 1819 he declared his decided hostility to parliamentary reform in whatever shape. On the occasion of the proceedings relative to the queen, he declared that "toward the object of that investigation he felt an unaltered regard and affection"; and soon after resigned the presidency of the board of control, and went abroad. Having been nominated governor-general of India, he was on the point of embarking when the death of the Marquis of Londonderry called him to the cabinet as secretary for foreign affairs, 16 Sept. 1822. One of his earliest acts in this situation was to check the French influence in Spain, the French having sent an army into that country to put down the revolutionary party. By way of withdrawing the Spanish-American colonies from French influence he decided to recognize their independence; thus, as he afterward phrased it, "calling the New World into existence to redress the balance of the Old." He continued to support the propositions in favor of the Roman Catholics, and in 1825 communicated to foreign ministers the determination of the government to appoint *chargés d'affaires* to Colombia, Mexico, and Buenos Ayres. In consequence of the attempts made by Spain to assist the malcontents of Portugal, it was immediately determined by the ministry to support the regency of that country, and troops were sent to Lisbon in January 1827. On 12 April 1827 his appointment to be prime minister was announced. His administration was terminated by his death, but not until it had been crowned by the Treaty of London (6 July), for the settlement of the affairs of Greece. As an orator Canning was showy and graceful, with a brilliant wit and caustic satire, though neither formed on a very masculine taste. During his career the leading domestic subjects on which the British Parliament was called upon to legislate were the following: the liberty of the press, the emancipation of the Roman Catholics, the test and corporation acts, the corn-laws, and reform in Parliament. Those of a foreign nature were, among others, the various overtures of peace between Britain and France, the settlement of Europe on the overthrow of Napoleon, the treatment of Italy by the Austrians, the Spanish revolution, and recognition of the South American republics. On all these questions, with one or two exceptions, he supported the high Tory side. The chief exceptions were the emancipation of the Roman Catholics, and the recognition of the South American republics. He was also desirous of amending the corn-laws. Consult Stapleton, 'Political Life of Canning' (1831); Stapleton, 'Canning and His Times' (1835); Lord Dalling, 'Historical Characters' (1867).

Canning, Sir Samuel, English civil engineer: b. Wiltshire, 1823. He is best known in connection with the laying of the Atlantic cables in 1865-6 and 1869, and those in the Medi-

terranean and North Seas. He was knighted in 1866.

Canning, Stratford (VISCOUNT STRATFORD DE REDCLIFFE), English diplomatist, cousin of George Canning (q.v.): b. London, 4 Nov. 1786; d. 14 Aug. 1880. His father, Stratford Canning, who had been disinherited owing to an imprudent marriage, and had gone into business as a merchant, died a few months after his son's birth, and in consequence young Stratford and his mother removed to Wanstead. He went to Eton, and in 1805 he was elected to a scholarship at King's College, Cambridge. Before graduating he was in 1807 appointed by his great cousin, then foreign secretary, to be his précis writer, and in the latter part of that year was sent as second secretary with a mission to Denmark. In the following year he accompanied as first secretary an important mission to Constantinople, which resulted in the conclusion of a treaty of peace with the Porte on 5 Jan. 1809. In the summer of 1810 his chief, Sir Robert Adair, was transferred to Vienna, and Canning temporarily succeeded him as ambassador at Constantinople. Before the arrival of Adair's successor, Canning made his reputation as a diplomatist by the masterly way in which he conducted the difficult negotiations which led to the signing of the Treaty of Bucharest on 28 May 1812. This treaty put an end for the time to the war between Russia and Turkey, and thus left Russia free to resist the advance of Napoleon. Moreover, it firmly secured English predominance at Constantinople, and was in this respect the first notable triumph in the traditional British policy on the Eastern Question. In 1812 Canning returned to London, and after declining in 1813 the offer of the chief secretaryship to Lord Aberdeen's Vienna mission, accepted in the following year the post of envoy extraordinary and minister plenipotentiary in Switzerland. He held this post till 1818, and was completely successful in his endeavors to free Switzerland from French domination, and to erect it into a neutral federal republic. Shortly after his return he was appointed ambassador to the United States, and he arrived at Washington in the autumn of 1820. He was again in London in 1823. The diplomatic agreement arrived at in 1824 was however, thrown out by the United States Senate. After a brief but important mission to the Russian capital he was again sent to Constantinople in October 1825 as ambassador. In the following year he succeeded in again patching up a peace between Russia and Turkey, and thus prepared the way for a joint representation by England, France, and Russia on behalf of insurgent Greece. Negotiations were, however, abruptly broken off by the Sultan's indignation on learning of the battle of Navarino, and Canning was later in the same year engaged, along with the representatives of France and Russia, in drawing up proposals for establishing a Greek kingdom. These were ultimately forced on the acceptance of Turkey in a more stringent form as part of the peace treaty which ended the Russo-Turkish war of 1828-9. In 1829 he resigned his position and returned to England, where he was created G.C.B. He entered Parliament as member for Old Sarum, but he ultimately secured election for King's Lynn. After acting as special envoy to the Porte in 1831-2, and to Portu-

CANNING INDUSTRY IN AMERICA

gal in 1832-3, he was in 1841 appointed for the third time ambassador at Constantinople. For a considerable period he was mainly engaged in assisting and encouraging the Sultan, Abd-el-Mejid, in his policy of reform, but after a visit to England in 1852, during which he was raised to the peerage, his efforts had to be directed to thwarting Russian designs. His diplomatic triumph over Prince Mentchikoff caused the czar in a moment of irritation to precipitate the Crimean war. He resigned in 1858, and the remainder of his career was passed mainly in retirement. In addition to a few volumes of poetry, he published works entitled 'Why am I a Christian?' (1873), and 'The Greatest of Miracles' (1876). A selection of his articles on eastern affairs was published in 1881 under the title of 'The Eastern Question.' See 'Life' by Stanley Lane-Poole (1888).

Canning Industry in America. The development in this country of the practical arts pertaining to the hermetical sealing of food, now so well known under the generic title of canning, is an interesting feature of the commercial growth of this country. Evolved from the studious and observant brain of an humble Frenchman, and tested through years of his plodding experience, the new method came amidst the throes of the French Revolution, in the year 1795, a veritable offspring of the First Republic. About 14 years later the French government, under Napoleon the Great, awarded the discoverer the prize of 12,000 francs, which long before had been offered for a method that would preserve alimentary substances without robbing them of their natural qualities and juices. Nicholas Appert, born in 1750, spent his life in brewing, wine-making, pickling, and the making of confectionery, living over 90 years, and continuing to the last to invest all funds he could obtain in the prosecution of his investigation in these different lines. He died, in 1841, neglected and alone. His children have received some benefit from his labors, the title of Chevalier being borne by a descendant of his to-day, indicating that the cross of the Legion of Honor had been awarded to him in recognition of his merits. This industry, which has now become essentially American, begins, therefore, exactly within the century. Appert had obtained financial assistance from English sources, and as a result we find that, about 1810, his method was being used in the factories of an English firm of purveyors.

In that year a patent was granted in England to one Peter Durand for a can, made of tin, to be used in hermetically sealing food, the patent also covering the use of glass, pottery, and other fit material. In the letters patent, it is stated that the new method was communicated to him by a foreigner residing abroad. Ezra Daggett, who was in the employment of this English firm, brought the secret, it is believed, to America between 1815 and 1818. In 1819, he was engaged in the packing of hermetically sealed food by this process in New York city, in company with his son-in-law, Thomas Kensett. The descendants of Mr. Kensett still have some cans of these goods in their possession which were put up in 1822, as the labels show. Salmon and lobster were among the earliest goods packed, and oysters also were preserved, according to these labels. In 1825, a patent was

granted to Ezra Daggett and Thomas Kensett for an improvement in the art of preserving. The can was then called a "case," the label containing directions for opening it.

About the same time that Daggett came to America from England, Charles Mitchell arrived in Boston from Scotland. He was born in London, there learning the canning business as an apprentice. He left London in 1820, and on reaching Boston almost immediately entered the employment of William Underwood, who established the firm of William Underwood & Company, in 1822, to hermetically seal food. There is a lack of information concerning the development of the industry during the next 20 years, but it was throwing out roots from the New York and Boston plants. In 1843, the firm of Treat, Haliday & Company were canning lobsters in New Brunswick, and salmon in Maine. There is a supposition that Haliday brought the process from Scotland and joined Treat about 1840. Already there was a known distinction between the French (or Appert) process and the Scotch method. Appert used glass vessels only, but the Scotch method required the puncturing of the tin after the first cooking, and then re-cooking after the hole was soldered. About 1846, Wells, Miller & Provost had a packing-house in New York, on Front Street, near Peck Slip; W. R. Lewis & Bro. established a factory at Portland, Me.; and E. C. Wright began packing oysters in Baltimore, having obtained his knowledge of the process from Thomas Kensett the first. At this time cans were made by the regular tin-workers, but cappers were becoming a regular branch of the business.

Henry Evans, Jr., a tin worker by trade, learned the process while working as a capper for Wells, Miller & Provost. In 1848 he went to Eastport to pack lobsters for that firm; in 1851 going to Baltimore and later engaging with Thomas Kensett the second, who had formed a partnership with Ira Wheeler in New York. In 1849 Evans had a factory at Newark, N. J., for Kensett & Company, and here were packed supplies of fresh vegetables for Dr. Kane's Arctic Expedition. These included tomatoes, onions, potatoes, and cabbage. Some time after this Evans went to the West Indies, where he packed for Kensett & Company the first pineapples ever packed in that way in those islands.

About 1850 the business began to develop rapidly, and its history is difficult to follow. The oyster business of Baltimore and the lobster and sardine fisheries of Maine were the principal bases of extension. William Numsen & Sons began work in this business in Baltimore in 1847; in 1849 they were packing cove oysters. Tomatoes, peaches, pears, and other articles were put up about the same time, the process being applied to nearly all the fresh foods in the different canneries. A number of active New Englanders located in Baltimore, embarking in the raw-oyster shipping business, and in time many of them began hermetically sealing oysters. The widow of Thomas Kensett the first sold the secret to Holt & Maltby and others, and thus they got into the cove-oyster packing. This title of "cove oysters" has come to be recognized as the specific name for hermetically sealed cooked oysters. "Cove" oysters were from coves famous for the size and quality of their oysters, which were located on the west

CANNING INDUSTRY IN AMERICA

side of Chesapeake Bay, above the Potomac. The canning business has given them immortality.

For the first half of the century the industry was obliged to produce all the supplies it needed by hand-labor, and even after canneries multiplied the output was necessarily restricted because of the number of hands required and the cost of the goods, based entirely on hand-labor. This industry is the connecting link between agriculture and manufactures, the can being an essential to the foods in this condition; and the food is the *raison d'être* of the can—useless each without the other. The manufacturing lines that have received an impulse from the introduction of this industry are those that unite in the production of the can, the cases, labels, and canning machinery.

Previous to 1850 the cans were made by hand, usually by cutting out the tin blanks with shears, beating the ends into shape with a mallet over a former of some kind, and cutting the opening with a hand-punch and mallet. Originally the opening was covered on the flat top by a flat circular piece of tin, well soldered down. The first can-making machinery we have any authentic record of was naturally adapted from such as tinsmiths used, they being the first providers of cans for the packers, but in 1849 Evans, at Newark, N. J., introduced the use of the "Pendulum" press for making can-tops. This same press came to Baltimore in 1851. With this press Evans introduced the crease and convex cap.

The California gold-fever gave a great impetus to the canning industry, and the list of the new firms that entered the business during the ten years from 1850 to 1860 would be too long to insert here, even if it could be made up with accuracy. Two historic firms arose just previous to the close of the first half of the century—Rumery & Burnham, of Portland, Me., and Louis McMurray, of Baltimore. The former was merged at the close of the war into the firm of Davis, Baxter & Company, a firm then well established. Later, this became the famous Portland Packing Company.

The Civil War gave another impulse to the industry, many of the established firms canning meat on government contracts. The canning of milk, under the title of condensed milk, resulted in a wide extension of the industry as previously carried on. Condensed milk, produced by evaporation and preserved with sugar, became a regular article of commerce; large quantities of it were used by the commissariat of the United States army. In 1860, the New York Condensed Milk Company of New York was in full operation, Mr. Borden being a stockholder of the company. In 1853, William Numsen & Sons of Baltimore were handling such large quantities in this same line that they formed the Baltimore Condensed Milk Company, in which Mr. Borden was also interested. On 4 Nov. 1856, a patent was issued to Gail Borden of New York for this method, and under the same date another for an improved method that dispensed with the boiling.

On 8 April 1862 a patent was issued to I. Winslow of Philadelphia for a new method of preserving green corn, which was the regular Appert process for hermetically sealing goods. Winslow assigned this to J. W. Jones, of Portland, Me. It is understood that Winslow learned this art in France, when on a visit there

in 1840. Nathan Winslow, of Portland, Me., is said to have been the first who commercially canned sugar corn, and the Winslow Packing Company has ever since been famous for its canning of this vegetable. There is reason to believe that the industry was first carried into the Mississippi Valley by the same Henry Evans, Jr., who was in Baltimore with Thomas Kensett the second. Evans, who was at that time a member of the firm of Evans, Day & Company, was returning East in 1873, when he happened to stop over at Circleville, Ohio. There he met C. E. Sears, who was engaged in drying sugar-corn, such as is known as shaker corn. He found he could purchase cut corn, fresh and sweet, at a price per can far below the cost of the corn in the husk at Baltimore. His firm bought largely of it that season, besides fitting up a cannery at Circleville to can it there. The next year, however, the cannery was sold to Mr. Sears. This same factory, greatly extended by Mr. Sears, is now owned and operated by his widow, Mrs. C. E. Sears, so successfully that in 1894 she packed the largest output of sugar-corn of any factory in the West, if not in the world.

In the spring of 1864 the business of canning salmon was begun by the firm of Hapgood, Hume & Company, at Washington, Yolo County, Cal., on the Sacramento River. In two years, salmon became scarce there, and after an inspection tour the firm built a cannery at Eagle Cliff, on the Columbia River, Washington. This factory began operations in 1867. The development of the Pacific Northwest was due more to the salmon industry than to any other single influence.

In 1866 G. C. Van Camp, of Indianapolis, Ind., began packing all kinds of fruits and vegetables in six-gallon cans, the goods being sold in the city markets by the pint or quart. In 1868 he went into the regular canning business, mostly in No. 2 cans. G. W. Baker began the canning of sugar-corn in Aberdeen, Harford County, Md., in 1866, and several of his sons still continue in the business.

Between 1877 and 1885 canneries developed in great numbers, Harford County, Md., alone having over 400. At the same time firms spread through all the States of the West, mainly packing sugar-corn and tomatoes. There had been many efforts to introduce machinery into the packing-houses, but it was generally resisted by the employees, led by the cappers, on whom depended the proper sealing of the cans. This important function had been organized into a regular system, one boss capper taking the capping of an entire factory, and, in some places, of several factories. For the sake of having experienced cappers in season the firms would keep them employed in making cans during the winter months, so even the making of cans was largely governed by these employees. Machines to do capping had been invented, but proved to be unpractical until, about 1883, I. H. Cox, of Bridgeton, N. J., introduced a hand-capper which proved a success. Very soon thereafter machines for all kinds of operations in the business were introduced. As machinery multiplied, country canneries increased in number because it supplied the place of hands, which the rural sections lacked. By 1892 the variety of machinery special to this industry had increased to such an extent that in

CANNING INDUSTRY IN AMERICA

that year, at an exhibition of canners' supplies held in the city of Chicago, in connection with a convention of the Western Packers' Association, Mr. Buchanan, chief of the Department of Agriculture of the Columbian Exposition, who had been invited to see it, stated to the chief of the Department of Machinery that it was extraordinary and novel. Almost every operation was done by machinery, and the business of "packers' supplies" has become a large one. The introduction of machinery greatly reduced the price of goods and increased the output. Meantime the old, original method of cooking (or processing, as it is called) the goods in open kettles in plain boiling water was improved upon by adding salt to the water to increase its density and thus gain greater heat and quicker results. About 1858 this was further improved by substituting chloride of calcium for the salt; and later, steam-kettles, having a cover and containing a coil of steam-pipe, were patented by A. K. Shriver and G. W. Fisher, both of Baltimore, and these have superseded all other methods for processing foods. Machinery likewise revolutionized the making of cans, until at present they are made by hundreds of millions in special factories, by "systems" that have almost banished the use of manual labor in their production.

The growth of the industry, the multitude of firms, the rapid cheapening of the goods, and the popularity of the business, which requires hermetical sealing and therefore exclusion of the goods from sight, made the fixing of grades and terms of sale and delivery absolutely necessary. Growing in a century from nothing to a vast industry, and peculiar in its nature, it was entirely without commercial rules. The first commercial organization of packers of canned goods met at Philadelphia in October 1872, but had only a brief existence. In February 1883 a Canned Goods Exchange was organized in Baltimore, that city then being the great centre and producer of these goods. A. L. Scott was its first president, and R. Tynes Smith its first secretary. The intention was to have regular sales on the floor daily, but this plan was abandoned. It, however, adopted grades for goods, rules and terms to govern transactions, and laid the foundation of commercial procedure for the business.

In 1885 the packers of the Mississippi Valley organized in Chicago under the title of the Western Canned Goods Packers' Association, with William Ballinger, of Keokuk, Ia., as president, and L. G. Seager, of Gilman, Ia., as secretary, and this has been a successful and powerful influence in the business, under the guidance of wise and tireless officers. It is based on the principle of mutual exchange of private statistics among members. The packers of the State of New York organized about the same year, with T. L. Bunting, of Hamburg, as president, and J. G. Gibson, of Utica, as secretary, with quarterly meetings and the statistical principle. Virginia and New Jersey organized about two years later, each locally.

The basis of a national association was laid at Indianapolis, in February 1889, at a meeting of a number of representatives of the local associations, thus making it of a federal nature; the plan being submitted by Mr. Bunting, of New York. This was consummated at a meeting in Baltimore in May of the same year, by

representatives from all the minor associations. L. G. Seager, of Gilman, Ia., was chosen its first president, and E. S. Judge, the publisher of "Trade," as secretary. There is nothing of the nature of a trust in the organizations of the packers; they are based entirely on the advantage of mutual information and general business rules.

In 1894 the Peninsula Packers' Association was organized at Dover, Del., with James Wallace as president and C. M. Dashiell, of Princess Anne, Md., as secretary. The "Atlantic States Canned Goods Packers' Association" was also organized in the fall of the same year at Baltimore, with E. H. Thurston, of Mechanic Falls, Me., as president, and H. P. Cannon, of Bridgeville, Del., as secretary. These bodies are also members of the National Association.

In 1900 there were in the United States over 2,000 known canned-goods, packing-firms, distributed among 42 States and operating about 2,200 canneries, of which Maryland had twenty-five per cent; Maine, seven per cent; New York, six per cent; Ohio, Illinois, and Virginia, three and one half per cent each; California, five per cent; Indiana, three per cent, and the other States ranging from fifty-six factories in Pennsylvania down to one in Arizona. The total output of canned goods is computed to have been about 700,000,000 cans of all sizes and kinds. The principal articles packed are tomatoes, corn, milk, oysters, corned beef, salmon, sardines, peaches, peas, beans, apples, pears, pineapples, small fruits, and pumpkins. They are important in about the order given, although values of the aggregate packs may not run in the proportion of the number of cans.

There is a species of sectionalism about the packing, due mainly to climatic influences. Thus, the principal corn-packing States are Maine, New York, Maryland, Illinois, Iowa, and Kansas. Tomatoes are more southern in their trend — New Jersey, Maryland, Indiana, Virginia, and Kentucky being the heaviest packers, while New York, Ohio, and Illinois have the principal milk-canneries. Cove oysters are confined to Maryland, Virginia, North Carolina, Florida, and Mississippi. Beef has been packed in many sections, but the States north and west of the Ohio now almost monopolize this line of canning. Salmon is now only packed on the Pacific coast, and Alaska is the main source of supply for the market, the canneries multiplying there as the fish have fled from the over-fishing of civilization.

Maine monopolizes the American sardine-packing, as it does lobster-packing, except what is done in Canadian waters. Peaches are packed principally in Maryland, Delaware, California, and Michigan; Georgia is, however, annually increasing the number of her canneries of this fruit. Peas are packed principally in Maryland, New York, Ohio, Indiana, and of late in Delaware; but many of the States in the upper Mississippi valley are steadily increasing their output. Beans are of three kinds: string beans, baked beans, and lima beans. The first named are a heavy but profitless pack, being put up in all sections to fill time between other crop seasons; the second have their headquarters in Massachusetts, though New York is a strong second, and the article is being added to the list of packers' products in canning-houses everywhere. Lima beans find most packers in New

CANNIZZARO — CANNSTADT

York, Maryland, California, and Ohio; the Pacific coast furnishing large quantities that in a mature state come east to be packed in winter as soaked goods. Apples are annually becoming a heavier pack in tin — Maine, New York, Maryland, Ohio, Illinois, Iowa, and Kansas putting up large amounts, and the industry is spreading to the new apple fields of Washington and Oregon. New York and California are the principal packers of pears, Maryland and Delaware also doing much in them. Pineapples, now one of the favorite fruits in tin, are packed mainly at Baltimore, Md., but the packing of them is extending in all directions. Small fruits have declined in the quantity packed till the pack of 1900 was probably not over one fourth the number of cans put up in a year 20 years ago. California is the great packing region for small fruits, but a varying amount is annually put up by cannery in all sections. Pumpkin is almost entirely confined to the northern States. Soups are packed principally in New York and Illinois, but the output of this class of goods is being increased by large canneries in several of the other States. There is an almost endless line of varieties of canned goods, from green figs in Mississippi and Texas to turtle in Florida, and dandelions and mince-meat pies in New York.

The annual aggregate values of these goods amounts in an average year to over \$82,000,000. Besides the market it has made for the agriculturist, it has made a demand for labor in the cannery and its work, which requires at least 400,000 people in the height of the season. They would require over 2,000,000 boxes of tin-plate for the cans, about 30,000,000 cases, and 700,000,000 labels. Such is the business to-day that 100 years ago had just been shown to the public in a foreign country. The genius of this American republic seized on this idea of the humble Frenchman, and has made of it a great industry and a new article of quotation in the markets of the world. Its vastness is due entirely to the ability of the American workmen to secure and consume the good things of life in all climates and all seasons. See also **PACKING INDUSTRY**.

E. S. JUDGE.

Sec'y Natl. Assoc. of Canned Food Packers.

Cannizzaro, Stanislao, stān is lā'ō kăn-nē-tsā'rō, Italian chemist: b. Palermo, 16 July, 1820. He studied medicine at Palermo, and chemistry at Pisa. In 1848 he was a member of the Sicilian Parliament and had part in the revolution in Sicily. In 1852 he became professor of chemistry in Alessandria; in 1857 in Genoa; in 1860 in Palermo; and in 1870 in Rome. He emphasized by clear definition the difference between atomic and molecular weights, and was one of the most influential in establishing Avogadro's law as a maxim of chemical science. He also discovered benzyl-alcohol and cyanamide. He wrote 'Sunto di un Corso di Filosofia Chimica, e Nota Sulle Condensazioni di Vapore' (1880); 'Relazione Sulle Analisi di Alcune acque Potabili' (1882); and 'Abriss eines Lehrganges der theoretischen Chemie,' which appeared in Ostwald's 'Klassiker der exakten Wissenschaften.'

Can'nock, England, a town in West Staffordshire, seven and one half miles northwest of Walsall, in the district known as Cannock Chase, which is rich in coal and ironstone.

Manufactures of boilers, edge-tools, bricks, and tiles, are carried on, and there are numerous collieries. Pop. (1901) 23,992.

Can'non, Frank Jenne, American politician, son of George Q. Cannon (q.v.): b. Salt Lake City, Utah, 25 Jan 1859. He was graduated from the University of Utah in 1878, and has since been engaged in journalism. He was United States senator, 1896-9, and has been prominent as a Silver Republican.

Cannon, George Lyman, American geologist: b. New York, 10 March 1860. He was educated at the University of Colorado and the Colorado State School of Mines, and has been an instructor in geology and biology in the Denver High School from 1887. He has published 'Geology of Denver and Vicinity' (1894); 'Outlines of Geology' (1895); 'Nature Study for Denver Schools' (1895); 'The Protection of Colorado Birds' (1899).

Cannon, George Q., American politician: b. Liverpool, England, 11 Jan. 1827; d. Monterey, Cal., 12 April 1901. He went with his parents to Nanvoo, Ill., in 1844, and was one of the earliest settlers in Salt Lake City. He was a member of the Legislative Council of Utah in 1865-6 and 1869-72, and was a delegate to Congress from 1865 to 1881. At a Constitutional Convention at Salt Lake City in 1872 he was chosen to present the constitution and memorial to Congress for the admission of the Territory into the Union as a State. He translated the 'Book of Mormon' into the Hawaiian language. His son, Frank J. Cannon, was elected one of the first two United States senators from Utah in 1896.

Cannon, Henry White, American bank president: b. Delhi, N. Y., 25 Sept. 1850. He was educated at Delaware Academy in his native town and engaged in banking. He was comptroller of the currency, 1884-5, and was a member of the International Monetary Conference at Brussels in 1892. He is a director of several important railroads and of the Manhattan Trust Company, and president of the Chase National Bank in New York.

Cannon, Joseph G., American politician: b. Guilford, N. C., 7 May 1836. Admitted to the Illinois bar, he was State's attorney of Vermillion County, 1861-8. He was a member of Congress from 1873 to 1891, and again, 1893-1903. He was 20 years on the Committee on Appropriations, and its chairman in the 55th and 56th congresses. He is rugged and unconventional in manner and a ready and fearless debater.

Cannon. See **ORDNANCE**.

Cannon-ball Tree, a large tree (*Couroupita guianensis*) of the order *Lecythydaceæ*, a native of Guiana, with a hard, woody, globular fruit six or eight inches in diameter — whence the popular name of the tree. It has large white or rose-colored flowers growing in clusters on the stem and branches. The pulp of the fruit is pleasant to eat when fresh.

Cannstadt, kăn'stat, Cannstatt, or Kanstatt, Germany, a town in Württemberg, in a beautiful and fertile district on the Neckar, two miles northeast of Stuttgart. Its antiquity is proved by the Roman remains found. It has celebrated and much-frequented mineral springs, active and varied industries, including the man-

ufacture of cotton and woolen goods, machinery, etc. Here are also railroad shops and dye works. The Neckar is here crossed by two bridges. Pop. (1900) 26,500.

Cano, kā'nō, Alonso, Spanish painter, sculptor, and architect: b. Granada, 19 March 1601; d. 5 Oct. 1667. He became so distinguished in each of these arts that his countrymen called him the Michael Angelo of Spain, although the title is due more to his versatility than to any resemblance in point of genius to the great Florentine. His 'Conception of the Virgin,' in the church of San Diego, at Granada, is considered his masterpiece. His works in sculpture and architecture are also numerous. He was a contemporary of Velasquez, and in 1639 was appointed court painter to Philip IV. His ungovernable temper on various occasions brought him in danger of the inquisition, and he was once put on the rack on suspicion of having killed his wife in a fit of jealousy, but was subsequently absolved from the charge. On this occasion his right arm was exempted from torture, as being *excellens in arte*. As an illustration of his whimsical character it is related that on his deathbed he refused to take the crucifix from the priest on account of its bad workmanship.

Cano, Juan Sebastian del, hoo-ān' sā-bās'-tē-ān dēl, Spanish navigator: b. Guetaria, Guipuzcoa, about 1460; d. on the Pacific, 4 Aug. 1526. He was one of the first to circumnavigate the globe (1522), as captain of one of Magellan's fleet, which he afterward commanded. In 1525 he was placed second in command of a similar expedition and became its commander by the death of Loaisa.

Cano, Melchior, mēl'kē-ōr, Spanish theologian: b. Tarrancon, 1523; d. Toledo, 30 Sept. 1560. He was a member of the Dominican order and an opponent of the Jesuits. He was professor at the universities of Alcantara and Salamanca, and was made bishop of the Canaries, but did not live in his see. He wrote 'De Locis Theologicis,' and many other theological works.

Cano y Masas, Leopoldo, lā ō pold o kā'nō ē ma'sas, Spanish poet and dramatist: b. Valladolid, 13 Nov. 1844. He graduated from the Spanish Military Academy at Madrid (1865), and was appointed professor of analytical and descriptive geometry there in 1867, retiring in 1885. His first comedy was 'Laurels of a Poet' (1852). His many other plays include: 'The Code of Honor'; 'Modern Idolatry'; and 'The Death of Lucretia.' He is the author of a volume of poems, entitled 'Arrows.'

Cano'ba, the Indian Apollo, or god of inspiration.

Canoe, ka-noo', a light boat designed for propulsion with a paddle or paddles. The term is very commonly used to designate the small vessels used by uncivilized people living near the water. The name is of West Indian origin, the Carib word being *canáoa*.

Canoes are built in divers forms and of various materials. Doubtless the most primitive form is the hollowed tree-trunk; the excavation, before the advent of adequate cutting-tools, being accomplished by means of fire. This

form is of wide distribution, being found in Africa, South and Central America, China, and the islands of the South Pacific and Indian oceans. In the form known as a "dugout" it is common in the United States. Among the island races of the Pacific the stability of the canoe is largely increased by the adoption of an outrigger, which, of varying forms, prevents capsizing on the one side by its weight and leverage, and on the other by its buoyancy. Many of these islanders sew planks together to form their canoes, making the joints watertight by means of gums, etc. Others use double canoes united by a strong platform. Such a vessel is capable of carrying a number of persons and a considerable lading. In South America, where large trees are abundant, very large canoes are constructed. The same is true of Africa, where the war-canoes of the native kings carry very large crews. They are often fantastically carved and ornamented.

As stated above, the propelling force of the canoe is usually the paddle, but sails are often used, particularly on sea-going craft.

The Esquimaux canoe is known as a *kayak*. This consists of a light wooden or bone frame covered with seal-skins sewed together with sinews. The skin covering extends across the top, forming a water-tight deck with but one opening amidships to admit the boatman. A hoop is fitted to this opening, and after the boatman has entered he fastens himself in by means of an apron so that the whole boat is watertight, and he becomes, as it were, part of the craft. So intimate is this union, and so skilful are the Esquimaux in the management of their kayaks, that the boatman can with a twist of his paddle capsize the craft and turn completely around under water, coming up again on the opposite side to that he went over. The paddle is about 10 feet long and double-bladed. The *oomiak*, or women's boat, is also made of seal-skins sewed over a framework; but it is of large, even clumsy build, and but for its propulsion by paddles might be classed as a boat rather than as a canoe. It is designed as a transport for women, children, and household goods rather than for the chase, for which the kayak is principally used.

The Aleuts build large skin boats, somewhat resembling the Esquimaux oomiak, which are propelled by paddles. Such a boat is known as a *bidarkce*. Other tribes of the west coast build large canoes of wood, the war-vessels being, like those of Africa, curiously decorated.

A peculiar form of canoe is found in the Kootenai district and on the Columbia River. While most canoes are constructed with the bow and stern either perpendicular or with a flaring overhang, these Kootenai craft are shaped, both at bow and stern, like the ram of a warship. In other words, the greatest length is along the bottom. These canoes are generally about 15 feet long and are constructed with a light framework of cedar covered with spruce or white-pine bark. This bark is cut off in one piece in the spring, when the sap is running, and is turned inside out, bringing the smooth side in contact with the water. The canoes are sewed with rawhide or tendons, and cracks and knot-holes are stopped with resin. Two squaws will make a canoe in four or five days; the chief difficulty being to get the bark off whole and to turn it wrong side out successfully.

CANON

The North American Indians have brought the canoe to its highest state of perfection. With the most frail material, birch bark, they construct a craft so light that it may be carried by one man, and yet so strong and buoyant that it will carry a very considerable load. A framework of light but tough wood is covered with sheets of birch bark, which are sewed together; the seams being waterproofed with resinous gums. They are propelled by means of a single-bladed paddle, which is dipped on one side only (a slight twist correcting the tendency to swerve from a straight line), or alternately on either side. The use of the birch-bark canoe by the Indians of the United States is rapidly becoming a thing of the past; but the art of building them has been preserved by their construction as pleasure-craft.

A form of canoe of recent invention is used solely for pleasure. About 1865 John Macgregor, impelled by a love of adventure, sought recreation on the rivers and fjords of Europe as well as on the waters of Egypt and Palestine. He developed his model from the Esquimaux kayak, and evolved a clinker-built craft of cedar, about 14 feet long and 2 feet in beam, entirely decked over with the exception of a "well" in which the canoeist sits. This is propelled by means of a double-bladed paddle, but a short mast enables the carrying of a sail. In a canoe of this type, which he named the *Rob Roy*, Macgregor cruised on the Danube, the Jordan, the Nile, the Seine, and on Norwegian fjords. From this early model other forms have been evolved, notably the *Nautilus* and *Shadow* types. Water-tight compartments ensure permanent buoyancy. Centre-boards counteract leeway when under sail on a wind. The interior space is so arranged as to provide a sleeping-place for the cruiser.

There are many canoe clubs in the United States, England, and Canada, and the canoe may be seen on all the coastwise and inland waters of those countries, as well as on the continent of Europe.

See article by W. Baden-Powell in the 'Encyclopædia of Sport' (1897); Hicks, 'Yachts, Boats, and Canoes'; Powell, 'Canoe Traveling'; the works of J. Macgregor ('*Rob Roy*'); Hayward, 'Canoeing with Sail and Paddle'; Field, 'Canvas Canoes.'

ELFORD E. TREFFRY.

Canon, Johann, yō'hān kā'nōn, Austrian painter: b. Vienna, 13 March 1829; d. there, 12 Sept. 1885. He entered the Austrian army and in 1848-55 was lieutenant of cuirassiers, but even while in the army had given much attention to painting, and finally devoted his whole time to it. His name first became known through his picture 'The Fishermiden,' exhibited in 1858. His work includes genre pictures, historical paintings, and portraits; the latter are thought to resemble Rubens or Van Dyck in style. Among his other paintings are 'Cromwell Beside the Corpse of Charles I.'; 'The African Lion Hunt'; 'Flamingo Hunt'; and the 'Fish Market.'

Cañon, or **Can'yon**, in physical geography, a great ravine or gorge; a deep, trench-like river valley with nearly vertical walls. It is the simplest type of river valley and is formed by a young stream in its torrent stage. Thus a cañon is, geologically speaking, of recent date, and is more likely to be found in an

arid region than in one of average rainfall, since its growth is due to the down-cutting action of the stream being faster than the general lowering of the land surface by rock-weathering and rain erosion. In southern Arizona, New Mexico, southern Utah, and Colorado, a great plateau 7,000 to 8,000 feet high has been elevated since Tertiary time, as shown by the latest rocks being of Tertiary age. They lie in horizontal strata, and the streams crossing the plateau have cut deep trenches with nearly vertical walls, exposing rocks of all ages down to the basement granite. Here the drainage is several thousand feet below the surface of the plateau. The Grand Cañon of the Colorado is 300 miles long. The average width from rim to rim does not exceed 10 miles throughout the widest portion of the cañon, and it frequently narrows to eight miles. The river does not occupy the middle of the gigantic trough, but flows at a distance varying from one to three miles from the south side. Practically all of the magnificently sculptured pinnacles and so-called temples lie north of the river at distances of from five to seven miles from view-points usually visited by tourists. The depth of the Grand Cañon measured from the south rim is considerably less than a mile. From the rim at the Bright Angel Hotel, where the altitude is 6,866 feet above sea-level, to the high-water mark of the river at the foot of the tourist trail, the drop is 4,430 feet. The highest point on the south rim at the Grand View Hotel is 7,496 feet, about 4,900 feet above the river. From the north side, however, the drop to the water level averages considerably over a mile and in places exceeds 6,000 feet. In a general way it may be said that the north rim is 1,000 to 1,200 feet higher than the south, thus producing the high, even sky-line so impressive to the tourist. It is altogether unlikely that such a chasm could have been carved through similar rocks in a region of average rainfall, as lateral torrents would have greatly widened the valley. Of other cañons and gorges in the Western States may be mentioned the gorge of the Columbia, where it breaks through the lava flows of the Cascade Mountains, 2,500 to 3,000 feet deep. It was eroded in Quaternary time. In California the gorges of the north and south forks of the American River are 2,000 to 3,000 feet deep; the cañon of the Merced River, including the Yosemite valley, is 3,000 to 5,000 feet deep, and the Grand Cañon of King's River 3,000 to 7,000 feet. In some of these cases the stream has cut its way down rapidly enough to form a cañon by following a fault-plane or other line of weakness in the rocks. In parts of the West the word cañon is used very loosely, being applied to almost a ravine or even a gulley.

Can'on (Greek, a rule, measure, or standard). 1. In the arts: When art has succeeded in producing beautiful forms the question arises, with what proportions beauty of form is united. Artists of genius first started this question, and imitators, inferior to them in talents, scrupulously followed their results, and naturally exalted some existing work into a model for every performance. Among the Greeks the celebrated statuary Polycletus (452-12 B.C.) first instituted such inquiries; and as he generally represented youthful, pleasing figures, it is probable that he fixed the standard of beauty in the youthful form. The canon (the model statue) of Polycletus was accordingly a statue which was

CANON

made principally for the purpose of showing the beautiful proportions of the human form in a youth just ripening into manhood. No copy of it is known to exist; the artist probably gave his model of proportion a quiet, simple attitude, without any strong distinguishing marks. His successors imitated it without deviation. Polycletus was not the only Greek artist who pursued such investigations respecting the proportions of form. Among the moderns, Dürer and Leonardo da Vinci have devoted themselves to similar inquiries.

2. In Scriptural literature, a term employed to designate the collection of books containing the rule or standard of primitive Christianity; that is, the canonical books of the Holy Scriptures. The canon of the books of the Old Testament, as contained in the Hebrew Bible, receives in this form equal respect among all Christians, because Christ and the apostles have expressly appealed to them, and in this way pronounced them writings inspired by God. There are certain books, however, belonging in subject to the Old Testament, but whose canonical character the Jews did not acknowledge, and which Protestants class together under the head of Apocrypha, and reject from the canon. For these there is only a Greek, and not a Hebrew text. The Western Church accepted them as canonical in the African Council, about the end of the 4th century; but the opinions of the clergy respecting them remained for a long time divided. St. Jerome denied their canonicity, and many theologians coincided with him. The Roman Catholic Church finally declared them canonical in the Council of Trent. (See *ΑΠΟΚΡΥΦΑ*.) Respecting the number of books belonging to the canon of the New Testament, the opinions of Christians were much divided till the 6th century. As early as the 2d century the separation was made into the Evangelicon (the four Evangelists) and the Apostolicon (the Acts and Epistles of the Apostles). The five historical books, the Epistles of Paul, the First Epistle of Peter, and the First Epistle of John were universally acknowledged to be genuine in the 3d century; hence Eusebius, in his 'Ecclesiastical History,' written about 325 A.D., calls them *Homologoumena* (universally received). The other five catholic epistles (Second of Peter, Second and Third of John, Jude, and James) he calls *Antilegomena* (doubtful, not universally received). At that time the Epistle to the Hebrews was considered genuine by most persons, and the Apocalypse by many. These books were received in the second half of the 4th century in the Egyptian Church (where Athanasius first used the term canonical), and in the Western Church. In the Eastern Church, properly so called (the dioceses of the patriarchs of Constantinople, Antioch, and Jerusalem), only the catholic epistles were of canonical authority at that time; the Apocalypse not till the 6th century. The canon of the New Testament has since remained unaltered, and the Protestant churches hold it in common with the Greek and Catholic churches. The results of critical examinations of the genuineness and canonical character of the single books of the Bible, even when they were unfavorable to the books, have produced no alteration in the established canon. The reasons of the ancient fathers of the Church for or against the canonical character of the biblical books were merely historical and tradi-

tional, and built on philological criticism; they are still the most tenable and rational; the philosophical grounds are more subject to be affected by extraneous influences.

3. In ecclesiastical use, a rule or law of doctrine or discipline as established by ecclesiastical authority. The term is farther applied to various matters of church organization and ceremony; also to books containing the rules of religious orders, etc., and to a list or catalogue of acknowledged and canonized saints in the Roman Catholic Church.

Another distinctive ecclesiastical use of the term is that which designates a dignitary possessing a prebend, or revenue allotted for the performance of divine service in a cathedral or collegiate church. Canons were originally priests who lived in community, appointed to assist the bishop in his duties, and supported by the revenues of the bishopric. Secular Canons are those who, in progress of time, have left off the custom prevalent in monasteries of living a community life, and have the privilege of enjoying the returns of their respective benefices. The obligations of the canons are contained under three heads: (1) the duty of residing in the place where the church they belong to is situated; (2) assisting at the canonical offices which are celebrated in the church; and (3) attending the meeting of the chapter at the appointed times. They cannot be absent from their benefices for a longer period than three months, and are obliged to sing or recite their office in choir. In their collective capacity they are called a chapter, and form the council of the bishop. In each chapter there are dignitaries. The name was originally applied to all the clergy, but was afterward confined to those who were connected with the cathedral church, or to specially privileged churches.

4. In music, with the ancient Greeks, the term canon signified what now is called monochord. At present it signifies a composition in which the several voices begin at fixed intervals, one after the other, and in which each successive voice sings the strain of the preceding one. In Italian, therefore, it is called *fuga di conseguenza*; in Latin, *canon perpetuus*, or continuous fugue; in German, *Kreisfuge* (circulating fugue). Sometimes each voice begins with the same, sometimes with different notes. The phrase or passage for imitation is called the theme or subject, the imitation the reply. Canons may be finite or infinite. The former end, like any other compositions, with a cadence, while the infinite canon is so contrived that the theme is begun again before the parts which follow are concluded. A canon may consist of two, three, four, or more voices. Canons differ from ordinary fugues; for, in the latter, it is sufficient that the subject be occasionally repeated and imitated according to the laws of counterpoint; but, in the former, it is essential that the subject be strictly repeated by all the succeeding parts; which repetition may be made in the unison or octave, the fourth, or the fifth, or any other interval of the scale. There are several other canons, as *canon polymorphus*, *canon per diminutionem*, and *canon per augmentationem*. Sometimes, also, a musical passage of a composition in which one voice repeats for a short time another, is called, improperly, a canon.

CANON CITY—CANON LAW

5. In printing, canon is the name given to a large type which is so called from the early use of it for printing the canon of the mass and the Church service-books.

Cañon City, Col., a city and county-seat of Fremont County, situated on the Arkansas River, near the mouth of the Grand Cañon, and on the Denver & R. G., and the Atchison, T. & S. F. R.R.'s. It is a well-known health resort, over 5,000 feet above the sea-level, with an excellent climate and hot and cold mineral springs. In the vicinity there are valuable deposits of limestone, coal, and iron. The river furnishes abundant water-power. Pop. (1900) 3,775.

Canon Finch, Towhee, Wren. See FINCH, TOWHEE, WREN.

Canon Law. Canon law is so named because it consists of rules or canons, which are established to guide the faithful to eternal happiness. In a strict sense, canon law comprises only those laws which emanate from an ecclesiastical authority that has supreme and universal jurisdiction. In a wide sense, it takes in also those laws enacted for the good of the faithful by anyone having ecclesiastical authority. The sources or fountains from which canon law has originated are: Sacred Scripture; divine tradition; laws made by the Apostles; teachings of the Fathers; decrees of the sovereign pontiffs; ecumenical councils; certain congregations of cardinals under orders of the Pope; custom, which, however, could in no case be contrary to divine law, common sense, good manners, public order, or the spirit and the rights of the Church. The Old Testament contains three sorts of precepts, moral, ceremonial, judicial. The moral code remains in full force under canon law; the ceremonial and judicial laws have lapsed. The New Testament is the chief source of ecclesiastical law. It contains also dogmas of faith, but with these canon law does not deal except indirectly. By tradition is meant a doctrine not written by its first author, but conveyed by word of mouth. Usually it is subsequently put into writing. Traditions, considered in their source, are divine or human. Divine are those which have God for their author, and which the apostles received either directly from Christ or by the suggestion of the Holy Ghost. Human traditions are termed apostolic if they originate with the apostles, or ecclesiastical if they come from the successors of the apostles, called bishops of the church. Divine traditions bind all the faithful; human only those of the localities and times to which they are applicable. Some of the enactments attributed to the apostles are: the Apostles' Creed; abstinence from things sacrificed to idols, and from blood and from things strangled, part of which prohibition has lapsed; the substitution of the Sunday for the Sabbath of the Jews; the institution of certain feast days; the fast of Lent. The sentences of the fathers, approved by the Church and made into universal laws by councils or the Roman pontiffs, are part of canon law. These sayings were not inserted in the collection of canons before the 6th century, John Scholasticus being the first to do this in the East in that century, and Regino first in the West in the beginning of the 10th century. To the student it is evident that the constitutions or decrees of the Roman pontiffs constitute the chief source of canon law; in fact, the entire

canon law in the strict sense of the term is based upon the legislative authority of the Pope. To understand this it is necessary to recall that in the Catholic doctrine all authority in the Church comes from above, not only in the office of priesthood, but also in the matter of jurisdiction or power of ruling. Catholic writers hold that the primacy or headship in the Church was established by Christ in Peter before the priesthood was conferred on him and the other apostles, the purpose of the Savior being to effect unity in his organization. The church thus organized is a spiritual monarchy; elective it is true, but not an aristocracy or democracy. Other religious organizations hold quite the opposite doctrine and would make their unity be a coalition of equal parts. This point of primacy of the Roman pontiff is also the line of separation between the canon law of the west and that of the separated Greek and the Russian churches, the review of which is given later in this article. Ecumenical councils, whose decrees are a source of canon law, are those meetings of the bishops of the church throughout the world, which are held under the presidency of the pope or his legates, and whose acts are by him confirmed. There are twenty councils recognized as ecumenic; the first being that of Nicæa in 325; the latest that of the Vatican in 1870.

During the first three centuries, the church was administered according to the scriptures only and the rules laid down by the apostles and bishops, as occasion required. Thus Clement, the disciple and successor of Peter, mentions the rule given by the apostles concerning the succession of bishops, and Ignatius the Martyr, in his epistles, exhorts his followers to diligently and tenaciously observe the traditions of the apostles. Thus, too, in the controversy concerning the celebration of Easter, the contestants on each side alleged the apostolic tradition. But councils were held at Ancyra and Neo-Cesaræa in 314, at Nicæa in 325, at Antioch in 322, at Sardica in 347, at Gangra from 362 to 370, at Laodicea between 337 and 381, at Constantinople in 381, at Ephesus in 431, and in the council of Chalcedon in 451 a collection of canons made up from these previous councils was read and partly authorized for the entire church. With the exception of those of Sardica, which are in Latin, the canons of all these early councils were formulated in Greek. The name of the compiler of this first collection is unknown and few of these early canons have reached our times, only their tenor being known through subsequent use in the western church, especially in Spain. After the emperors assumed the Christian religion, ecclesiastical legislation became important, and the laws of the church were therefore in the year 438 inserted in his collection by the emperor Theodosius II. Valentinian III. afterwards adopted this collection for the West. About this time—the latter half of the 5th century—a compilation was made of the so-called apostolic canons and constitutions together with decrees of some of the councils. Originally there were 50 canons called apostolic, but their number was afterwards increased to 85, some of which are certainly spurious. In the East these were received as having the stamp of authority, but not so in the West, where their origin was doubted. However, Dionysius adopted the smaller collection of 50,

CANON LAW

considering them useful for discipline, and thereby without determining their origin procured for them in Rome the stamp of authority. John Scholasticus made a collection of canons for the Greek church in 564, to which he added 68 canons taken from Saint Basil. He divided the work into 50 titles. To this he later added the laws of the empire which had relation to the laws of the church, and the new compilation became known as *Nomo-canon*. The emperor Justinian II. in 692 assembled a council in his palace at Constantinople, called the Trullan Council from the room in which it was held, and 102 canons were enacted. When the acts and canons of this council were submitted to Pope Sergius at Rome for approval he refused even though the emperor ordered his armor-bearer to bring the Pope to Constantinople. The Trullan compilation consisted of the so-called Canons of the Apostles, those of the ten councils previously mentioned, the canons of the synod of Carthage, the decrees of a synod in 394 at Constantinople under Nectarius, the canonical decisions of the twelve Eastern patriarchs and of some bishops from the 3d to the 5th centuries, the canon of a council held at Carthage under Cyprian in 256, to all of which were added the 102 canons drawn up by the Trullan council itself. Afterwards 22 canons of the second council of Nicæa held in 787 were added. On this foundation the church law of the East was based up to the middle of the 9th century. By the Trullan synod, priests were allowed to marry, which up to that time was against the canon law of both the Eastern and the Western church. The Trullan synod also sanctioned the Canons of the Apostles, one of which teaches the doctrine of the re-baptisers, which had been previously repudiated by Pope Gelasius. Herein is noticed the first real divergence between Eastern and Western canon law. Photius, who was intruded into the see of Constantinople, called a council against the patriarch Ignatius in 861, and 17 canons made by this council were added to the codex of the Greek church. He also formulated a new collection, in which the second part, called the *Nomo-canon* remained unchanged. The emperor Leo the Philosopher, who deposed Photius, rescinded his collection of laws, but nevertheless the seeds of the separation of the Greek church from that of Rome had been implanted by the work, although a complete schism took place only later in 1054 under Michael Cerularius. From time to time new ecclesiastical constitutions issued from the emperors, as from Leo Philosophus in 911, from Constantine Porphyrogenitus in 961, from Alexius Comnenus in 1118, from Isaac Alexius in 1185-90. The resolutions of synods summoned by the patriarchs of Constantinople, epistles of renowned bishops and their decisions, formed another addition to the canon law of the eastern church. The first commentary on the Greek codex was undertaken by Theodore Prodromos in the 8th century. The second, containing the text with a commentary, is the *Nomo-canon* of Doropater. The monk John Zonares composed a comprehensive verbal interpretation in 1120, using the collection of Photius as a basis. Fifty years later, Theodore Balsamon made a commentary with a view to practical questions, comparing the canons with the civil law and insisting that Justinian's maxims only applied when conformable to the Basilics. He added many matters

not found in the collection of Photius. Epitomes of canon law were composed at a comparatively early period, the author of the first of which appears to have been Stephen of Ephesus in the 5th century. There is a synopsis by Aristenus augmented by Alexius Aristenus in 1160, and another by Arsenius, a monk of Mount Athos, in 1255. Constantine Harmenopoulos in 1350 composed an epitome of the spiritual law in six parts, using, with some omissions, the collection of Photius as altered by Zonares. In order to reduce canon law to a more practical form than it appeared in the collection of Photius and at the same time present a more comprehensive work than these epitomes, Matthæus Blastares drew up his *syntagma* in 1335, divided into chapters of different lengths and arranged according to the principal word of these rubrics, the numbers of the chapters commencing anew under each letter. Each chapter begins with the ecclesiastical law, followed by the civil law applicable to it, without, however, mentioning the source of the latter. This work came into very general use among the clergy. The collection of Photius and the *syntagma* of Blastares continued still in use under the Turkish rule and were alike termed *Nomo-canon* and, metaphorically, the 'Rudder.' The collection and interpretation of Zonares also obtained canonical authority. From these materials many extracts were translated into modern Greek up to the 18th century, and several text books composed for the use of the clergy, some of which were printed in Venice. Lastly a comprehensive collection was published in 1800 at the instance of the patriarch and synod. It contains the old Greek text of all the authentic canons of councils since Photius and Zonares, to which are added interpretations of the authentic commentators in modern Greek, especially those of Zonares and Balsamon. In the interpretation, the canons of those fathers are taken into account which had not been confirmed by any general synod, but had obtained a canonical authority. Nothing was inserted from the municipal law works which did not agree with the canons. Several appendices were added, including formulas for ecclesiastical business, and upon these and similar collections is founded the present law of the Greek separate church. The Russian followed the Greek church in adopting compilations of church law up to the end of the 15th century. In 1550 certain regulations respecting the jurisdiction of bishops were introduced. Some canonical epistles and rules drawn up at councils are used in addition to the Greek codex, and manuals adapted to the country have been compiled therefrom. Peter the Great in 1721 changed the chief executive authority in the church from a patriarch into the Holy Synod, by decrees of which the church to-day is ruled. By an arrangement lately made with the Roman pontiff the bishops and priests under Roman jurisdiction are ruled by the canon law of Rome, subject to the civil laws of the Russian Empire, and to prevent complications, Russia, besides a resident minister and two secretaries, has at the Vatican a representative agent for ecclesiastical affairs.

In the Western or Latin Church the canons of Nicæa and Sardica were the only code publicly received up to the end of the 5th century. About this time the Spanish translation of the Greek code was turned into barbarous Latin,

CANON LAW

and became known as the *Prisca*. The decretals of the Roman pontiffs were added to the canons of the Greek code, as found in the *Prisca*, but it seems that Dionysius the Little, about the year 500, was the first to formulate a collection of the councils and the decretals. He had previously made a collection of the concilia for Stephen, the bishop of Dalmatia. The deacon Theodosius later made a new collection founded on the old Spanish and the Dionysian. A third collection termed the *Avellanian*, valuable for the historical documents it contains, appeared in the latter half of the 6th century. These, however, were superseded by a second edition of Dionysius, made probably in 731 under Pope Gregory II. In this edition some decrees overlooked previously were added, together with an appendix consisting of the statutes of the Roman pontiffs from Linus downwards, those up to Sericius, however, being given only in an historical form as no longer actually in existence. The German conquerors of Italy in 476 did not, although Arian, interfere with the laws by which the church was governed, but when Justinian reconquered Italy he introduced his *Novellæ* in the Julian translation in place of the codex of Theodosius II., and this order of things was later upheld by the Lombard kings in their edicts. In Africa the deacon Fulgentius Farrandus made the first collection in 547, termed *Breviatio*. This was an excerpt in 232 numbers of nearly all the Greek canons, including the Nicæan, to which was added the African concilia under Gratus in 348-9, under Genethlius in 390, and that of Carthage in 419 with its 33 canons, together with 304 taken from synods as well as an extract from the canons framed at Hippo in 393. The second African work was the *Concordia* of Bishop Cresconius in 690, founded upon Dionysius, but arranged in 300 titles instead of in chronological order. This work was incorporated with Dionysius and appeared under the name *Breviarium*. But the Arabs now put a sudden stop to all further development of canon law in this quarter. As early as the 5th century, as noted above, there was in Spain a translation of the Greek canons; in the 6th century Martin of Braga made a collection of canons, but in the 7th century Isadore of Seville held two councils, half church, half civil, the canons of which may be said almost to have formed the basis of the constitutional law of Spain in both church and state down to the 15th century. The collection of canons known as *Collectio Isadoriana* or *Hispana* was divided into two parts; the first containing the classified series of Greek, African, Frankist and Spanish canons, and the second the decretals from Pope Damasus in 366 to Gregory the Great in 604. In the 5th century an extensive but confused collection of councils and decretals was compiled in Gaul under Gelasius. It was founded upon the old Spanish version and some peculiar version of the canons of Nicæa and the *Prisca*. Out of it sprung several other collections; the first in the middle of the 6th century, containing the councils of Nicæa, and of Sardica, some Frankist concilia and papal decretals; the second of the same date containing Greek, African, and Gallic canons, and papal decretals in a confused order; the third in the 7th century, containing 103 numbers, many decretals, Frankist, Roman, and Italian concilia. A fourth and a fifth collection of the same century

contained chiefly Frankist and Spanish conciliar decrees. After Charlemagne in 774 on his first visit to Rome had received from Pope Hadrian a copy of the Dionysian collection with some additions, he had it sanctioned in a synod at Aix-la-Chapelle as the *codex canonum* for the Frankist empire. In addition to these principal works many of the bishops composed capitularies for their own dioceses, as Boniface of Mayence, Theodulph of Orleans, Hincmar of Rheims. The '*Hispana*' circulated among the Franks in a more or less corrupt form. One edition, which appeared between the years of 829 and 857, has caused great controversy, and is known as '*Collectio Pseudo-Isadoriana*,' or *False Decretals*. The author called himself Isadore Mercator, and the name led many to believe the work that of Isadore of Seville. The best evidence shows that Levites Benedict of Mainz was the compiler, but no purpose for the forgeries in the work has been conclusively shown. After the preface and some minor apocryphal documents, the first part contains 50 of the apostolic canons taken from '*Hispana*' and 60 supposed decretals of the popes from Clement in 92 to Melchisedech in 314, arranged chronologically. The second part consists chiefly of canons taken from the '*Hispana*.' In the third part, founded also on the '*Hispana*,' the compiler has interpolated 35 decretals. A supplement contains some brief regulations regarding processes against bishops, said to be by Capitula Angilramni, a bishop of Metz. The collection was regarded as genuine by all canonists and theologians for 700 years from the 9th to the 15th century. Cardinal Nicholas of Cusa in the 15th century first expressed doubts of the genuineness of some of its contents. In the following century religious bitterness overshadowed scholarly inquiry, but it is now admitted by Protestant writers that the compilation was produced, not in the interest of the pope but of the Frankist bishops in order to protect themselves against oppression by temporal rulers on the one hand and church councils on the other. For this reason such insistence is found in the collection on the right of appeal to the pope in every major cause of a bishop and also that the pope's permission is necessary to the holding of a provincial synod. The sources from which the compiler chiefly borrowed his materials were the Bible, the fathers, genuine canons and decretals, Roman law, the works of Rufinus and Cassiodorus on church history and the lives of the popes in '*Liber Pontificalis*.' Of the supposed decretals a large number are authentic although antedated and ascribed to earlier popes to give them the value of antiquity, while others embody the traditional contents of actual but lost decretals. The influence of the pseudo-Isadorian collection has been much exaggerated for it wrought no material change either in the faith or the discipline of the church, since it merely put into enactments the prevailing ideas and doctrines of that period on church government. Had it introduced a violent change the innovation would have caused a speedy inquiry into the genuineness of the work. However, it cannot be doubted that a written text often in controversy is a more forcible argument than traditional law, and hence the false decretals naturally exerted some influence.

To meet the necessity of rendering canon law more accessible from the 10th to the 12th

CANON LAW

century at least 36 compilations were made, only the authors, titles and dates of which seem necessary for this article. The first was a manuscript under twelve heads, divided into 354 chapters, abstracted from Cresconius. The second was extracted from Dionysius and the pseudo-Isadore collection. The third is very voluminous, and taken from Hadrian's codex with numerous additions. The fourth, by an unknown author, contains portions of concilia, decretals, and extracts from the Fathers. The fifth, made by Regino, abbot of Prüm, between 906 and 915, is founded on three Frankist collections, the Fathers and the West Gothic Breviary. The sixth is a Leipsic codex; the seventh a Darmstadt codex. The eighth is attributed to Rotger, Bishop of Treves in 922. The ninth is a Viennese manuscript. The tenth is also a manuscript of five books, composed in Italy in the middle of the 10th century, and is founded upon the Irish collection in 65 titles, on fragments of the Fathers, lives of the saints, decretals, Julian's 'Novellae,' with capitularies of the emperors added up to Henry I. The eleventh was addressed by Abbo, abbot of Fleury, to King Hugo and his son Robert, and consists of a treatise of 52 chapters on the church and clergy. The twelfth was composed by Burchard, bishop of Worms, in 1012-23, and contains the canons of the apostles, the transmarine, German, Gallic and Spanish councils, papal decrees, and other passages. The 13th is a manuscript in 12 books made in Germany or France. The 14th is a Terraconian manuscript belonging to the 11th century. The 15th is an introduction to discipline. The 16th is a collection taken chiefly from Halitgar, Rasbanu, Maurus and Burchard. The 17th is a rich collection in manuscript by Anselm, bishop of Lucca in 1086. The 18th is 74 titles taken from the above work, and the 19th and 20th appeared about the end of the 11th century, both taken from the works of Anselm and Burchard. The 21st is a work in 13 books. The 22d is the capitularies of Cardinal Atto in 1081 and excerpts from decretals. Cardinal Deusdedit composed the 23d in 4 books, at the end of the 11th century, from Dionysius, the Greek canons, the old Italian and Spanish-Saxon and Roman records. The 24th is by Bourgo, bishop of Satrim in 1089, and is in 10 books. The 25th is in two books and belongs to the 11th or the 12th century. The first chapter is inscribed from the Primate of the Roman church and is published with the Dionysian collection. The 26th is the decree attributed to Ivo, bishop of Chartres, and the 27th is the Pannormia in eight parts by the same author in 1090. The 28th is a large manuscript collection; first of decretals, second of councils, third of fathers, then Roman and Frank legal collections. The 29th was made under Pascal II. in 1102-18 in seven books. The 30th is attributed to Hildebert, bishop of Tours, in 1134, and may be the same as the ten books attributed to Ivo. The 31st is a manuscript in 15 books called the collection of Saragossa. The 32d is wholly extracted from the above. The 33d is taken from Burchard and Ivo. The 34th is a penitential book in nine titles belonging to the 12th century. The 35th belongs to the middle of the 12th century and is taken chiefly from Anselm of Lucca and the collection dedicated to Anselmus. Gregory, a Spanish priest, is the author. Lastly, Algerius of Liege in the

beginning of the 12th century compiled a work on 'Justice and Mercy,' which contains a treatise on church discipline in three parts, taken from Anselm and Burchard for the most part. Gratian, a Benedictine monk, composed at Bologna in the middle of the 12th century a scientific and practical work on the canon law with references and proofs. The first part treated of ecclesiastical administration, the second contained 26 legal positions, with their answers, the third part concerned the liturgy of the church. The whole work is founded on previous collections and contains many mistakes. It was never approved by the church though it obtained great authority and superseded all other collections. Other collections are by Cardinal Laborans in 1182, that of Bernard of Pavia in 1190, that by Gilbert, an Englishman, in 1203. The universities of Bologna and Paris at an early period began to exercise great influence on canon law and their opinion in controverted questions was considered decisive, and was termed the authority of the schools. Gratian's collection was made the basis of lectures in Bologna and teachers of the canons were called *magistri* and *doctores decretorum*. Their teachings were soon gathered together in books of commentaries. Soon after the collection by Gratian, the Extravagantes, or decrees not yet collected, were gathered together, there being between the years 1179 and 1227 14 different compilations, only five of which received the stamp of authority. Pope Gregory IX. ordered a code to be published in which the entire body of law should be properly arranged. What was useless should be cut out, what was ambiguous should be corrected. Raymond of Pennafort was intrusted with this task, which he finished in the year 1233, and the collection was sent to the universities of Bologna and Paris with instructions that it was to be the sole authority. The whole work is divided into five books. The first treats of ecclesiastical judicature and of prelates; the second of civil suits; the third of civil causes before the episcopal forum; the fourth of betrothals and marriage; the fifth of judicial proceedings in criminal matters and of punishments. To these five books was added by Pope Boniface VIII., in 1298, a sixth book of decretals. This was followed in 1334 by the Clementine or collection of decretals by Pope Clement V. The Extravagantes of John XXII. in 1334 and the Extravagantes Communes (73 decretals from Boniface VIII. to Sixtus V.) were gathered by authority and made part of the code or 'Corpus Juris Canonici.' Commentaries on the 'Corpus' were made by the doctors, and systematic works for the use of courts were published. In the 15th century legal literature seems confined to these efforts. But in the 16th century Pope Paul IV. confided to a congregation of cardinals, with canonists as consultors, the work of revising and correcting the 'Corpus Juris.' Gregory XIII. approved the work of the committee and an authentic edition was published in 1580, in which the glosses are retained, and on which all subsequent editions have been based. The corrections made by the commission are marked "*cor. Rom.*" in the text. Two appendices were added, one the *Institutiones Lancelotti*, the other *Septimus Decretalium*, which contained the Extravagantes to Sixtus V. in 1590. Neither is of public authority, but both are very useful and recognized

CANON LAW

by scholastic approval. Since then the Bullarium Benedicti XIV., which contains the constitutions of that pope, has been made of public authority. There is also a collection of papal bulls, called Bullarium Magnum Romanum, made up in 14 volumes, which was published in 1744 and continued in 1840; but it is very imperfect and only a private collection. Anyone who desires to know canon law must learn the 'Corpus Juris,' even though to-day many parts have been changed by the councils of Trent and the Vatican and by new papal decrees. In the 'Corpus' itself the different portions stand as *lex prior* and *lex posterior*, so that in cases of contradiction the latest is preferred. With certain modifications the 'Corpus' still has the force of law in matters relating to ecclesiastical judicature, to divine worship, to doctrine and discipline. It is the code still followed in the schools and used in church courts, not only as the source of argument but also as the method of procedure in many cases. The 'Jus Novissimum' in canon law consists of laws published from the time the 'Corpus Juris' was closed, that is, since the Extravagantes were inserted down to the present day, and includes the decrees of the councils of Trent and the Vatican. Except the Bullarium of Benedict XIV., mentioned above, no authentic collection has been made of the various constitutions and laws made by the Roman pontiffs since the close of the 'Corpus.' Still every genuine decretal is part of the canon law. The same may be said of the decisions of certain congregations of cardinals which have the force of law, especially that of the Council which authoritatively interprets the decrees of the Council of Trent. So evident was the need of a revision of canon law that at the ecumenic Vatican Council, held in 1870, proposals were made by a number of bishops to have a committee appointed, consisting of the most eminent canonists, to revise the 'Corpus Juris' or rather prepare a new one, omitting whatever owing to changed times was no longer applicable. Nothing was done before the adjournment of that council, but Pope Pius X. by a *motu proprio* in the year 1904 appointed a special committee of cardinals, with a number of consultors, and a canonist from each nation, to thoroughly revise not only the 'Corpus Juris' but all the canon law of the church, that general for the world and that special to the various nations. He himself is president of the committee to which he assigned the following cardinals: Seraphin Vanutelli, Agliardi, Vincent Vanutelli, Satolli, Rampolla, Gotti, Ferrata, Cassetta, Mathieu, Gennari, Cavicchioni, Merry del Val, Steinhuber, Segna, Vives y Tuto, and Cavagnis. Archbishop Gasparri was appointed secretary. At least five years will be consumed in the work, and the code thus established will hereafter be the only authorized canon law of the Latin church.

It will have been noticed that canon law is not traceable to any original code, but is a development founded on the general moral rules laid down in the Scriptures and especially in the New Testament. Neither is the Roman civil law traceable to any code, but is a gathering of principles suggested by good reasoning for promoting the civil interests of its subjects. Compared to the Jewish law, the principle upon which Roman jurisprudence was founded was very different—the former treats

principally of criminal matters and is most severe in its penalties; the latter on the contrary, treats all questions as civil, and prefers restitution to punishment. When the Roman emperors had been converted to Christianity, in promoting its progress by special constitutions which then became part of the canon law, they necessarily gave to canon law much of the spirit of their civil law. Thus it happens that in the canon, as in the Roman civil law, there was little severity in criminal matters, and many cases which other peoples than the Romans treated as criminal were cognizable by a civil tribunal and an indemnification was effected by damages. Generally no crime was punished capitally, especially where no force or violence was employed. This spirit of leniency is manifest throughout canon law to the present day. During and after the 4th century wherever Roman power conquered the nations and wherever Christian missionaries converted the pagans canon law was introduced through the influence of the pope and the emperor. It permeated and modified the laws of the peoples of northern Europe, as well as those of England to a certain extent. With it necessarily came the principles of Roman civil law. The rules for the application of canon law were as follows: (1) In cases not contained in the civil law, or the rule for which was obscure, open to doubtful interpretation, or not expressly determined, if expressly and clearly resolved by the canon law, this latter formed the basis of the decision; and on the contrary, if the case was not provided for, or ambiguously resolved by canon law, when it was expressly met or its solution more clearly indicated by the civil law, this latter was to be preferred. (2) In cases of conflict, the civil law formed the rule for courts of civil, and the canon in those of ecclesiastical jurisdiction. Thus, when a matter of canon law cognizance arose in the civil courts the decision was given according to the rules of the canon law; and *vice versa*, when a question of civil cognizance occurred before an ecclesiastical tribunal. (3) Within the imperial states the civil law formed the basis, and the canon law in the papal states. (4) In matters of a feudal nature the civil was preferred to the canon law. (5) In forensic causes the canon is not presumed to differ from the civil law. When the Western empire passed under the rule of a barbarian race the Roman and the canon law were not only preserved, but to a great extent they influenced the legislation of the conquerors. Alaric, Attila, Ricimir did not disturb the outward form of Roman government. In the collection of west Gothic laws, gathered in 672 A.D., there are evident traces of the part which the Roman clergy took in the compilation. The Burgundian laws also show literal excerpts from the Roman law. Roman law is found also in the Bavarian code composed in the 7th century, as well as in the capitularies of the Franks, which commence in the year 560 and are introduced by a literal transcript of a novel of Valentinian. It is noteworthy that the German tribes did not force their laws upon their subjects in those portions of their conquests where the Roman law was acknowledged. It was natural, too, that the churches, as juridical persons, should follow the Roman law, not only on account of its connection with religion and the great degree of favor it manifested toward the Church, but

CANON LAW

also of the accuracy of its provisions in this respect. Like the law of the Teutonic tribes, that of England is an accumulation of individual laws. While Britain was conquered by Julius Cæsar in 54 B.C., still it was only at the end of the 1st century of the Christian era that Roman manners, arts, architecture, language, and laws were introduced. The Roman law superseded the customary laws of the island and remained in force until the year 455, when Britain became derelict because of the removal of the seat of empire to Constantinople and the impossibility of the emperors defending it against the Picts and Scots. Christianity was introduced into Britain under the Roman dominion and was preached in Scotland and Ireland before the year 430. Roman literature, arts, and law, however, received a sudden check by the Saxons, who, when they invaded Britain, imposed their law upon the conquered people. The Danes subsequently did the same. Still we are informed by the Venerable Bede that Ethelbert, king of Kent, in 613, with the assistance of his wise men, made certain decrees and gave judgments between his subjects in conformity with the principles of Roman and canon law, at least so far as regarded sacrilege, bishops, and the like. Indeed, it is not surprising that the Saxons and Danes, whose codes contained a great admixture of Roman law, should carry the same principles with them into their new settlement in England. Traces of a Roman original may be seen in the laws of Ina, king of the West Saxons, Offa, king of the East Angles, and in the laws published by Canute which were translated into Latin. Thus it happened that, when Edward the Confessor compiled a code out of the materials then at hand, much of the Roman and canon law was inserted and thus became the basis of much of the common law of England and the United States. During the dominion of the Saxons and Danes, those Britons who had fled to Wales were governed by their own princes. Howel Dha, in 940, is said to have assembled his bishops and the more literate among the laity for the purpose of revising the law which was translated into Latin at his command. In the 85th article he approves the Roman rule of two witnesses being sufficient in cases where no specific number is stated, and for holding the testimony of one to be insufficient, except of a woman in cases of rape, of a lord between two tenants, an abbot between two monks, a father between two of his children, a priest in a matter attested in his presence, and a thief turning king's evidence in the place of execution. Most of the Roman laws of this age seem to have been taken from the Theodosian code. Although the foot of the Roman soldier never trod on the bosom of Ireland, nor did a Roman general have a chance to introduce the Roman law, still the principles of canon law were enforced throughout Ireland and Scotland by Saint Patrick in his canons. One of them, translated by the Anglican Bishop Usher, reads: "Wherever any cause that is very difficult and unknown to all the judges of the Scottish nation shall arise, it is rightly to be referred to the see of the archbishop of the Irish (that is, of Saint Patrick) and to the examination of the prelate thereof. But if there, by him and his wise men, a cause of this nature cannot easily be made up, we have decreed it shall be sent to the see Apostolic, that

is, to the chair of the Apostle Peter, which hath authority of the city of Rome."

In 680, at the command of Ethelred, Egfrid, king of Northumberland, Aldwulf, king of the East Angles, and Lothar, king of Kent, Theodore, at that time archbishop of Canterbury, summoned a synod at Hatfield, in which the canons of the five general councils of Nicæa, Constantinople, Ephesus, Chalcedon, the second of Constantinople, were enforced, together with the Concilia drawn up under Pope Martin at Rome in 648. He also collected in his capitularies the most important points of church discipline. Later he wrote his 'Book of Penances.' In the latter half of the 8th century, Egbert of York made an extensive collection of canon law from the sources then existing. He also wrote the book 'De Remediis Peccatorum.' In the 8th century a collection was made in Ireland in which the Dionysian collection and Roman, Gallic, and Irish councils are used. King Henry I., in 1100, endeavored to repudiate a number of church laws and ordered that Peter's Pence was to be paid to the king instead of the Pope. Henry II. entered into a controversy over the enforcement of canon law with Thomas à Becket. In 1215, by the Magna Charta, King John confirmed to the prelates and barons of his kingdom the freedom of election of the clergy, and this acted as a general acknowledgment of ecclesiastical rights and liberties. In 1230, Otho, the legate of Pope Gregory IX., held a national synod, and in 1268 Othobon, the legate of Pope Clement IV., held a second, both of which, as Blackstone says, had a great effect on the ecclesiastical jurisprudence of England. Under King Henry III., Boniface, archbishop of Canterbury, enacted several canons which seemed against the existing laws of the realm, and under Stephen an ecclesiastical and a secular party were formed, the latter adhering to the common law as tenaciously as the clergy and nobility did to the canon and civil law. In the parliament of Merton, however, the adherents of the canon and civil law were defeated on the proposition to make *legitimatio per subsequens matrimonium* legal also in England as it was under canon and civil law. Under Richard II., more than 100 years later, the feud still existed. Anglo-canon law was further augmented by the decrees of provincial councils held under the archbishops of Canterbury, from Stephen Langton to Henry Chichiley, which were glossed by William Lindwood, and later enforced also by the archbishops of York. The kings meantime had also enacted many statutes on the relations between secular and ecclesiastical jurisdiction. A statute of Henry VIII. rendered void all canons which were contrary to the law of the realm or hurtful to the royal prerogatives, and provided a commission to revise them. Edward VI. renewed the commission, but the code was not confirmed before his death. Mary repealed all these acts, but Elizabeth revived the first act of Henry VIII. In 1603 some canons were made in the convocation of the province of Canterbury and confirmed by the king but not by Parliament. It is held that, therefore, these bind the clergy in church matters, but not the laity, except in so far as not repugnant to the laws of the realm. By acts of Parliament (26 Henry VIII., 1; 35 Henry VIII., 3; 1 Elizabeth, 1) the king was declared the supreme head of

CANON LAW

the Church, and it became treason (1 Ed. VI., 12; 5 Eliz., 1) to doubt it or to defend the supremacy of the Pope as head of the Church. These acts and subsequent ones reversed canon law in England, Ireland, and Scotland. Speaking of the courts of the archbishops and bishops of the English Church to-day, Blackstone says: "An appeal lies from all these courts to the sovereign in the last resort, which proves that the jurisdiction exercised in them is derived from the crown of England. . . . It appears beyond a doubt that the civil and canon laws, though admitted in some cases by custom in some courts, are only subordinate and *legcs sub graviore lege*. They are by no means with us a distinct, independent species of law, but are inferior branches of the customary or unwritten laws of England." In Scotland many of the provisions of canon law became the law of the land. During the 16th and 17th centuries canon law was taught in the Scottish universities, and from very early times many of the youths of Scotland attended the schools of the Continent, whence not a few returned as doctors *in utroque jure*, that is, canon and civil law. The canons of provincial councils, held yearly, and at whose meetings representatives of the king were present, constituted a national canon law which was recognized by the Pope and by Parliament and enforced in the courts of law. Even to this day, though the ecclesiastical system of the country is Presbyterian, the old canon law still prevails to a certain extent. "So deep hath this canon law been rooted," says Lord Stair in his 'Institutes of the Law of Scotland,' "that even where the Pope's authority is rejected yet consideration must be had to these laws, not only as those by which the Church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws which, because of their weighty matter and their once being received, may more fitly be retained than rejected." In two old acts of the Scotch Parliament, made in 1540 and 1551, the canon and Roman law are mentioned as the common law of the country, the clause used being "the common law, baith canon, civil and statutes of the realme." Since the restoration of the Catholic hierarchy in England in 1850, and in Scotland in 1878, the churches under Roman jurisdiction have held various councils and enacted laws to fit the changed conditions. These laws, having been examined by the committee of cardinals in Rome appointed for such purpose, have become, as it were, a national canon law for the Catholics of those countries. In a similar way the Catholics of newly established nations, owing to various reasons, are ruled by a modified canon law which gives the bishops and superiors a very extensive authority. Such is the case at present in Canada, Australia, and the United States. These modifications pertain chiefly to the election of bishops, the appointment and removal of parish clergy, the tenure and administration of church property. The second and third plenary councils of Baltimore contain special modifications for the United States. For Canada a preparatory meeting for a plenary council was held in 1903 under the presidency of the apostolic delegate. For Mexico, West Indies, and South America a council was held in Rome of the bishops of those countries, and its decrees were published

in 1901. Other national modifications of canon law in the course of time have been introduced by concordats made by the Pope with the rulers of Christian nations by which he grants them certain concessions. As a nation Spain enjoys the greatest concessions, France up to the present coming next. The councils held in Gaul in the 4th and following centuries show the beginning of a national canon law for France. The fourth canon of the Council of Arles, convoked by King Clovis in 511, prohibited certain laymen and teachers from receiving holy orders without the king's consent. The Council of Orleans, in 549, shows that at that time the king's consent was necessary for the election of bishops. Many points regarding a special liturgy, the administration of the sacraments, the matter and forms of ecclesiastical trials are to be found in these same early councils. The laws of Dagobert, in 620, show special protection given the Church but also lay the foundation for future subjection; for councils could not be held without consent of the king, and bishops were elected not unfrequently at the dictation of royalty. But the capitularies of Charlemagne and his successors, collected in 825 by the abbot Ansegiso, were very favorable to the Church. Under the third dynasty, especially because of the feudal law, bishops, abbots, and chapters exercised almost complete civil authority over the people in their charge; but the oath of fealty was imposed on the prelates as vassals of the king. On the other hand, the kings took upon themselves the defense and guardianship of the Church, and on the pretext that at the death of the prelate they were the guardians of the vacant see, they performed many acts of ecclesiastical jurisdiction, among which was the administration of the temporalities of the vacant church. This was not done, however, without the assent of the sovereign pontiffs. Herein is found the origin of *ius Regalia* which later caused such trouble. In the year 1268 a pragmatic sanction was issued by Saint Louis which gave liberty of election of bishops and ordered that the general canon law should be observed throughout France. However, the genuineness of this law has been seriously questioned. Under Philip the Fair the seeds of absolute independence of the secular from the spiritual authority were sown; and about the same time serious contests arose between clerical and lay judges concerning their jurisdiction. On appeal to the king the clergy won; but the jurisdiction of the Church was gradually lessened, and at this time the appeal "as from abuse" was introduced, that is, a clergyman might appeal to the king from an abuse of the power exercised by a bishop. This was diametrically opposed to general canon law. The great schism of the West brought out the question whether the Pope or an ecumenical council was superior, and the controversy became especially bitter in France. Charles VII. selected certain passages from the Conciliabule of Basle, and in 1438 issued a pragmatic sanction in which the superiority of the council over the pope was declared, and elections both to episcopal sees and in monasteries were to be held after the ancient law of France. Louis XI. suppressed this decree, but it was revived after his death until finally condemned by the Fifth Lateran Council, and changed by

CANON LAW

the concordat made between Leo X. and Francis I. In this concordat many of the dispositions of the pragmatic were preserved; but the concordat differed from the pragmatic in this: that in place of the election of bishops and prelates in case of vacancy the king was given the right to present to the sovereign pontiff, within six months, a doctor or licentiate in theology who should be at least 27 years of age and otherwise competent. The pontiff would grant institution. The parliament, after a long contest, agreed to the execution of this concordat. Herein is seen the beginning of the system of government nomination of bishops, concerning which, in 1903-4, the Pope and the French government were at variance. In the 16th century the government long opposed the publication of the decrees of the Council of Trent, but finally, without mentioning the source, the chief decrees, word for word, were published in 1579 by royal order. In 1681 the Gallican clergy, at the instance of the government, met in extraordinary convention and adopted a declaration favoring the extension of the *Regalia* to all France. This was repudiated by Pope Innocent XI. The next year the Gallican clergy adopted four propositions in which they attacked the Holy See in administering temporal matters, and declared that the judgment of the Pope on a matter of faith was not irreformable except when the consent of the Church had been added. The king ordered the observance of this declaration, but it was condemned by Alexander VIII. Later, King Louis XIV. wrote the Pope that he had ordered that the decree should not be observed. Nevertheless, the *Regalia* was observed up to 1789 throughout all France, and the government continued taking the revenues of all vacant bishoprics and appointing to benefices during the interregnum. In an edict of 1695 a code of ecclesiastical law as observed in France was enacted, and in it was the appeal "as from an abuse," that is, from the ecclesiastical to the civil authorities. The national convention in 1790 passed a civil constitution for the clergy by which dioceses and parishes were suppressed and the Church made subject to the state. In 1801 Napoleon, as first consul, and Pope Pius VII. made a concordat in which the Catholic Church was acknowledged as the state Church, and by which new limits were assigned to dioceses and parishes, and by which especially the right of nominating bishops was given to the ruler of France. To the nominees the Pope would grant institution. Various other regulations were made, and the French government took upon itself the support of the bishops and parish priests in place of restoring the immense church properties which had been confiscated. During the year 1904 a great agitation occurred for the suppression of this concordat because of controversies over some bishops held delinquent and suspended by the Pope. With the abrogation of the concordat the state will not longer support the clergy, nor can it nominate to bishoprics. During the 19th century the liturgical worship of the Church in France was made conformable to that of Rome, and other matters of discipline were brought under general canon law.

Undoubtedly canon law has exerted a wide and lasting influence on the nations of Europe and America. It made them Christian states

and directly or indirectly modified their constitutions. State legislative assemblies based their proceedings on the methods of Church councils. The law of nations is simply the application to nations of the principles of Christian law taught to individuals. The ancient Romans as well as barbarous tribes considered all foreigners enemies; the Church taught the brotherhood of all men. The Pope, as the common father of all Christians, acted as arbitrator in the disputes between nations, and so noteworthy became the Roman Rota, to which the Pope referred international disputes, that at times much of its work was deciding important questions for rulers of nations. The system of Church administration served as a model for that of states, and the clergy, especially in the earlier and Middle Ages, being the educated class and following canon law, naturally introduced many of its rules into everyday life. The elevated condition of woman is due to the canon law prescriptions regarding marriage, which the Church enforced on all nations converted to Christianity. Questions relating to widows and orphans were within the jurisdiction of canon law and Church courts. The incorporation of Church bodies, from which other corporations took their origin, had its foundation in the law of Justinian and was imported into England with the civil and canon law. As in the Roman law, the charter of the sovereign is always expressed, or at least implied. From England the idea of corporation and corporation sole came into American law. The writ of habeas corpus had its origin in the Roman law "*interdictum de libero homine exhibendo*." Inheritance by will and the rule for the descent of real property came from Roman law, while trial by jury, with challenges of the jurymen, was determined in the Roman Lex Servilia and Lex Cornelia. While in England "Christianity is part of the law of the land," in the United States this "is true only in a qualified sense" (33 Barber 548), and owing only to "the fact that it is a Christian country and that its constitution and laws are made by a Christian people" (23 Ohio St. 211). Nevertheless "the decision of ecclesiastical courts or officers having, by the rules or laws of the bodies to which they belong, jurisdiction of such questions, or the right to decide them, will be held conclusive in all courts of civil administration, and no question involved in such decisions will be revised or reviewed in the civil courts, except those pertaining to the jurisdiction of such courts or officers to determine such questions according to the laws or usage of the bodies which they represent." (Quoted with approval in 98 Penn. 213.) "Civil courts will not review the action of ecclesiastical tribunals except where rights of property are involved" (62 Iowa 567; 23 Ill. 456). Justice Strong, in 'Relations of Civil Law to Church Policy,' concludes: "I think it may be safely asserted, as a general proposition, that whenever questions of discipline, of faith, of church rule, of membership, or of office have been decided by the Church in its own modes of decision, civil law tribunals accept the decisions as final and apply them as made." See also LAW; CATHOLIC CHURCH, ROMAN.

P. A. BAART, S.T.L., LL.D.,
Author of 'Church and State in the United States of America,' 'The Roman Court,' 'Legal Formulary,' 'Tenure of Church Property in the United States,' etc.

CANON OF THE MASS—CANONICUS

Canon of the Mass, that part of the mass following the sanctus. The rule of the Roman Catholic Church for celebrating the Eucharist is contained in this canon.

Canon of Scripture. See CANON; BIBLE.

Can'ness. At the close of the 8th century the title of caneness was given to a class of women who took the vows of chastity and obedience, but not that of poverty, and were not cloistered, though they had a common table and dormitory, and were bound to the recitation of the breviary, as were nuns. They derived their name from their being enrolled in the canon or official list of the church. Their occupations were chiefly education of girls, transcription and embellishment of church office-books, and embroidery of vestments. The advantages of such institutions as asylums in a rough age were soon visible, and they multiplied in consequence, but as in many houses the religious motive had little to do with entrance, a distinction was drawn ere long between cananesses regular and secular. The secular cananesses were for the most part members of princely or noble families, practised much state and luxury, and retained none of the rule save the common dormitory and the recitation of the Hours in choir. In Germany, several abbesses of cananesses were princesses of the empire, kept up feudal state, and furnished contingents to the imperial army from their vassals; and at the Reformation some chapters adopted the new opinions, and subsist to the present day as Protestant foundations, enjoying the revenues, and admitting to membership only ladies of noble birth or daughters of distinguished members of the military and civil services, whose sole obligation is celibacy during membership. The institute never spread beyond the limits of the empire, and the non-German houses were chiefly in Hainault, Flanders, and Lorraine.

Can'ngate, The, the principal street in the Old Town of Edinburgh. It is upward of one mile in length, rising gradually with a regular and steep incline from a small plain at the east end of the town, on which stands the palace of Holyrood, and terminating at the castle. The appearance of this street, the scene of many interesting historical incidents, is rendered remarkable by the loftiness and antique aspect of the houses with which it is lined, most of them ranging from five to seven stories in front, and often more behind. At different points it is known by other names, High Street, Lawnmarket, etc.

Canon'ical Books, the books of Scripture belonging to the canon. See CANON; BIBLE

Canonical Hours, certain times of the day set apart by ecclesiastical law in the Roman Catholic Church to the offices of prayer and devotion, namely, matins with lauds, prime, tierce, sext, none, even-song or vespers, and compline. The day was divided into seven parts and the observance of the canonical hours was as follows: prime, tierce, sext and none at the first, third, sixth and ninth hours of the day, counting from six in the morning; vespers at the eleventh hour, compline at midnight and matins shortly after midnight. These times are no longer strictly adhered to. In England the

canonical hours are from eight to twelve in the forenoon, before or after which the marriage service cannot be legally performed in any parish church.

Canonicals, the prescribed dress or vestments worn by the clergy of the Roman Catholic, Protestant Episcopal, and other churches when officiating at religious services. The wearing of vestments is of ancient origin. In all the pagan religions the priests wear symbolic garments, and in the Jewish system the priestly robes were very elaborate and significant. The modern Jewish system retains these ecclesiastical vestments and the ministers of many Protestant denominations wear such attire. See CHASUBLE; STOLE, etc.

Canon'icus, Indian chief: b. about 1565; d. 4 June 1647. When the Pilgrims landed, he and his nephew Miantonomo (q.v.) were associate sachems of the fierce Narragansetts, mustering some 3,000 warriors. In the winter of 1621-2 he sent to the little colony, with about 50 fighting men, a bundle of arrows bound with a snakeskin, either as a preliminary of war or a demand of gifts to avert it. They returned the skin stuffed with powder and ball, and the frightened savages did not dare keep it, but saw that it got back to the colony. A lasting treaty was negotiated, and it was partly owing to the influence of Canon'icus that the tribe never made war against the English, even many years after his death, till "King Philip's War" of 1675. In 1636 the septuagenarian chief was succeeded as head sachem by Miantonomo, but still retained the prestige of age and experience. In that year Roger Williams and his company, who had first sought refuge from the Massachusetts authorities among the Pokanokets, thought it best to go farther, and applied to the Narragansetts. They were kindly received, and to them was granted the peninsula where Providence stands. According to Williams, Canon'icus was always most friendly and helpful till his death. In 1637 the Pequots of Connecticut were attempting to form a general Indian league to exterminate the English settlements, and the Massachusetts government sent an embassy to prevent the Narragansetts from joining it. Canon'icus received them with great Indian pomp in his wigwam of poles and mats, surrounded by his "mugwumps" and leading warriors, gave them a feast with boiled chestnuts and huckleberry Indian pudding for dessert; and probably more from kind regard for Williams than through the embassy's persuasions—kept the peace, and even furnished a couple of hundred warriors to help the English. These allies, however, played the usual ambiguous Indian part, ready to massacre the beaten side. In 1644 the Gorton (q.v.) party succeeded in persuading the chiefs that it was under the protection of irresistible powers in England; and on 9 April Canon'icus, his son Mixan, and his nephew Pessacus, brother and successor of Miantonomo, signed two astonishing documents, of whose purport it is very unlikely that they had been correctly informed. One of them ceded the land and people of the Narragansetts to his Majesty of Great Britain, placing the Indians themselves under his protection, and appointing Gorton and three others their attorneys to carry the instrument to him. The other, addressed to the Massachusetts authorities, was

the refusal of their invitation to visit Boston. It also menaced the authorities on account of Miantonimo's death, and threatened to revenge it on Uncas. Finally, however, a truce was signed, and three years later Canonius died.

Canoniza'tion, a ceremony in the Roman Catholic Church, by which deceased persons are declared saints. Alexander III., in 1170, pronounced it an exclusive privilege of the papal chair. This ceremony is one of great solemnity. The Pope institutes a formal investigation of the qualifications of the deceased person recommended for canonization, in which his manner of life and the genuineness of the miracles ascribed to him are strictly examined; and a promoter of the faith, commonly called the devil's advocate, is appointed to assail the candidate's memory. If the examination is satisfactory, the Pope pronounces the beatification of the candidate. (See **BEATIFICATION**.) In order to collect new proofs of his merits (for example, of miracles performed by his relics), the actual canonization generally takes place many years afterward; and then a day, usually the anniversary of the death of the new saint, is dedicated to his honor, his name is inserted in the canon, that is the list or register, of the Saints (thence canonization), churches and altars are consecrated to him, and his remains are preserved as holy relics.

Canons, Book of, a system of canons or rules prepared for the Church of Scotland by its bishops, in accordance with the direction of Charles I. It was published in 1636, having undergone revision at the hands of Archbishop Laud. In Scotland its promulgation was felt to be arbitrary, and the strongest objections were made against it.

Canons of the Church of England, the "constitutions and canons ecclesiastical" drawn up in convocation in 1604 by the synod in London. These canons, still in force as revised, number 141, and were designed to confirm the established system of the Church of England, particularly through the test oath, aimed at the Puritan party, in which the clergy were sworn to subscribe willingly to the supremacy of the sovereign, to the Articles, and to the Prayer-book.

Canon's Yeoman's Tale, **The**, one of Chaucer's 'Canterbury Tales.' The narrator, the ill-treated guard and servant of a worthless canon, describes the manner in which alchemists, such as his master, contrive to dupe their victims.

Canop'ic Vases, or **Canop'i**, certain large-bellied vessels found in tombs in Egypt, containing the embalmed intestines of bodies that had been converted into mummies. Four of these were placed in a tomb, each appropriated to a particular deity, and surmounted by the effigy of the head of such deity, as of a man, an ape, a jackal, or a hawk. It is to those with the human head that the term canopi has been more particularly applied. They were frequently made of basalt, and decorated with figures in relief or paintings; or of costly white alabaster, with spiral flutings; or they were formed from black burned clay. The name is derived from the town Canopus.

Canoppi, Antonio, ä-n-tô'nê-ô kä-nô'pê, Italian scene-painter: b. 1773; d. St. Petersburg, 1832. He received his first education from his

father, who was employed as civil engineer by the Duke of Modena, and after occupying himself for some time with fresco-painting, was subsequently employed as scene-painter in Venice and Mantua. Compelled to resort to flight at the time of the French invasion, he first betook himself to Vienna and afterward to Moscow, where he was engaged in the decoration of many palaces, which, however, were burnt in the great fire of 1812. From that time until his death he was engaged as scene-painter of the imperial theatre of St. Petersburg. His most admired efforts in that branch of art were his architectural scenes for Mozart's 'Magic Flute,' and for 'Semiramis.'

Canopus, or Canobus, a bright star of the first magnitude, belonging to the southern constellation Argo, and invisible in the north or middle parts of the United States, on account of its nearness to the South Pole.

Canopus. 1. In Egyptian mythology, a water-god, represented on vessels of a spherical shape. These vessels were used by the ancient Egyptians to keep the water of the Nile in good drinking condition. The worship of Canopus was superseded under the first Ptolemy by that of Serapis—a Greek inscription in honor of Serapis at Canopus having been discovered by Mr. Hamilton amid the ruins of Alexandria. 2. In ancient geography, one of the most remarkable towns of lower Egypt, near the most western mouth of the Nile. The name of the town is variously ascribed to the divinity of the same name and to Canopus, or Canobus, the helmsman of Menelaus, who died in Egypt of the bite of a serpent, after his return from Troy, and who was buried on the site of the town. It was the seat of a temple of Serapis, whose oracle was celebrated, especially among the sick seeking for restoration to health. 3. In astronomy, the name of the brightest star except Sirius. It is in the constellation Argo.

Canopy, a net of very ancient use, as in Greece and Egypt, for protection against mosquitoes, gnats, etc.; hence any net or hanging placed over a bed for like purpose; also such a hanging or a projection over a bed, a door, a window, an altar, a pulpit, throne, niche, tomb, or other architectural structure. Canopies are also borne over the heads of kings or other personages and over sacred objects in ceremonial processions.

Canosa (kä-nôs'sä) **Di Puglia**, Italy, a city in the province of Bari, 14 miles to the southwest of Barletta on the Adriatic. It was the ancient Canusium, and various relics of Roman times, including an amphitheatre, have been found. Between Barletta and Canosa was the ancient Cannæ (q.v.), where in 216 B.C. Hannibal defeated the Romans. Tombs cut in rock on a hill have been found in the neighborhood, and in 1813 a beautiful burial-chamber was opened, which contained the corpse of a warrior in armor. A copper lamp and a number of beautiful vases were also found here. The paintings upon the vases were the most important part of this discovery. They refer to the Greek-Italian mysteries. Pop. about 25,000.

Canossa, a ruined mountain castle of northern Italy, 12 miles southwest of Reggio. In the 11th century it belonged to Countess Matilda of Tuscany, with whom Pope Gregory VII. resided in 1077, when he imposed a severe

penance upon the excommunicated Emperor Henry IV. (q.v.). The phrase "to go to Canossa" has come to be proverbial for some humiliating surrender, withdrawal, or the like.

Canot, kã-nõ', Theodore, Italian adventurer and slave trader: b. Florence, 1807; d. 1850. His father was a captain and paymaster in the French army; his mother a native of Piedmont. He made his first voyage in 1819, in the American ship *Galatea*, of Boston, from Leghorn to Calcutta. He visited Boston, sailed to various parts of the world, was shipwrecked near Ostend, and again on the coast of Cuba, where he fell into the hands of a gang of pirates, one of whom claimed to be his uncle, befriended him for some time, and finally sent him to an Italian grocer at Regla, near Havana, who was secretly concerned in the African slave trade. Canot made his first voyage to Africa in 1826, landing at the slave factory of Bangalang, on the Rio Pongo, Senegambia. After quelling a mutiny on board and helping to stow away 108 slaves under 15 years of age, in a hole 22 inches high, the young adventurer entered the service of the owner of the factory. He soon became a favorite with the native chiefs, whose proposals of matrimonial alliance were exceedingly embarrassing. He visited various parts of the neighboring country, improving every opportunity to study the workings of the trade in which he had determined to engage, and collecting by the aid of the African princes a stock of slaves for his newly established depot at Kambia near Bangalang. In May 1828 his factory and goods were destroyed by fire. He afterward purchased a vessel at Sierra Leone, in which with a cargo of slaves wrested from a trader in the Rio Nunez, he sailed to Cuba. Three more expeditions soon followed; in the first he lost 300 slaves by smallpox; in the last he was taken by the French and condemned to 10 years' confinement in the prison of Brest, in France, but after a year's durance was pardoned by Louis Philippe. Resolved still to pursue his dangerous occupation, he returned to Africa, and was the pioneer of the slave traffic at New Sestros. After meeting with various adventures here in his expeditions among the surrounding tribes, we hear of him in 1839 on a pleasure trip to England. He returned to New Sestros and in 1840 shipped to Cuba 749 slaves. He now resolved to abandon his illicit course, and obtaining from an African chief a valuable grant of land at Cape Mount, established there in 1841 a trading and farming settlement under the name of New Florence. In March 1847 New Florence was destroyed by the British, who suspected it to be a slave station, and Canot subsequently removed to South America, where he engaged in legitimate commerce. He resided for some time in Baltimore, Md., and finally received from Napoleon III. an office in one of the French colonies in Oceania. Consult Mayer, 'Captain Canot, or Twenty Years of an African Slaver' (1854).

Canova, Antonio, ăn-tõ'ně-õ kã-nõ'vã, Italian sculptor: b. Possagno, Venetia, 1 Nov. 1757; d. Venice, 13 Oct. 1822. Canova may be considered as the restorer of the graceful and lovely style, and the founder of a new school, as far as it respects softness and delicacy of execution, and excellent handling of the marble. He was sent as an apprentice to Bassano,

where he acquired skill in the mechanical part of the art. His first work, executed in his 17th year, was an Eurydice in soft marble, of half the natural size. He was now sent to the Academy of Venice, where his proper study commenced. He gained several prizes, and excited expectations which he more than equalled in the sequel. The first work which he was commissioned to execute was the statue of the Marchese Poleni, of the natural size, for the city of Padua. In his 25th year he finished the group of Dædalus and Icarus, of the natural size, in Carrara marble, a remarkable juvenile work. The senate of Venice sent him, in 1779, to Rome, with a salary of 300 ducats. A group as large as life — 'Theseus Sitting upon the Slain Minotaur' — was the first large work by which Canova made himself known in Rome (1783). In 1783 he undertook the execution of the tomb of Pope Clement XIV., in the church Degli Apostoli. He retained the usual style of composition, and only improved on the depraved taste of the school of Bernini. He next executed the group of 'Cupid and Psyche,' where he first displayed his own peculiar style, of which loveliness is a striking characteristic. The figures are exceedingly delicate and graceful. He was employed on a second public monument, the tomb of Pope Clement XIII., in St. Peter's. It was finished in 1792, and is distinguished by its colossal size and simple style. Meanwhile the fame of the artist continually increased. He established in the palace of the Venetian ambassador a school for the benefit of young Venetians. His next works were a winged Cupid, standing; another group of 'Cupid and Psyche'; a group of 'Venus and Adonis' for the Marchese Verio, in Naples; the tomb of the Venetian Admiral Emo, for the Republic of Venice. This is a combination of bas-reliefs with figures in full relief. Canova also produced a very lovely 'Psyche,' standing, half-dressed, with a butterfly in her left hand, which she holds by the wings with her right, and contemplates, with a calm, smiling mien. A 'Repentant Magdalene,' of the natural size, belongs to the works in marble in which he has carried the expression of the melting and the soft to the highest degree. His 'Hebe' is a delightful figure. In an easy and animated attitude the smiling goddess of youth hovers upon a cloud, pouring nectar with her right hand into a bowl which she holds in her left. Both vessels, as well as the coronet of Hebe and the edges of her garment, are gilt. Canova is fond of a variety of material, and often endeavors to give to his statues the effect of pictures. He next displayed his talent for the tragical in the raging 'Hercules Hurling Lichas into the Sea.' The group is colossal, and Hercules somewhat larger than the Farnesian; but it makes a disagreeable impression, which proves that the genius of Canova was not adapted to such subjects. His representation of the two pugilists, 'Kreugas and Demoxenos,' is much more successful. A standing group of 'Cupid and Psyche' was the triumph of his art. Psyche here appears again holding the butterfly. In 1796 and 1797 Canova finished the model of the celebrated tomb of the Archduchess Christina of Austria, wife of Duke Albert of Saxe-Teschen, which in 1805 was placed in the church of the Augustines at Vienna. In 1797 he made the colossal model of a statue of the king of

Naples, one of his finest works. This statue, 15 palms high, was executed in marble in 1803. During the revolution of 1798 and 1799 Canova accompanied the senator prince, Rezzonico, on a journey through Germany. After his return he remained for some time in the Venetian territory, and painted for the church of his native village an altar-piece, in which are represented the dead Christ, the Maries, Nicodemus, and Joseph, and, on high, God the Father. He afterward executed in Rome his 'Perseus with the Head of Medusa,' which, when the Apollo of Belvidere was carried to France, occupied its place and pedestal. This statue increased the fame of Canova more than any of the preceding works. But Perseus is only an imitation of the Apollo. The separate parts are of exquisite beauty in form as well as in masterly, delicate finishing. In 1802 he was invited by Bonaparte to Paris to make the model of his colossal statue. In the beginning of 1803 the model of the emperor's bust, and afterward that of his statue, was to be seen in the workshop of the artist. There is not a more successful work of the kind than this bust: the figure of the statue is not so good. Among the later works of the artist are a Washington, of colossal size, in a sitting attitude; the tombs of the Cardinal of York and of Pius VII.; an imitation of the Medicean Venus; a 'Venus Rising from the Bath'; the colossal group of 'Theseus killing the Minotaur,' far surpassing his earlier works in the heroic style; the tomb of Alfieri, for the Countess of Stolberg, in Florence, and erected in that place (the 'Weeping Italia,' a colossal statue in marble, is particularly admired); the 'Graces Rising from the Bath'; the monument of the Marchioness of S. Croce; a 'Venus'; a 'Dancing Girl,' with almost transparent garments; a colossal 'Hector'; a 'Paris'; a 'Muse,' larger than the natural size; a model of a colossal 'Ajax'; and the model of a sitting statue, in rich robes, of the Archduchess Maria Louisa of Austria. After the second fall of Napoleon, in 1815, Canova was commissioned by the Pope to demand the restoration of the works of art carried from Rome; went from Paris to London, and returned to Rome in 1816, where Pius VII. inscribed his name in the golden book of the capitol, declared him "to have deserved well of the city of Rome," and made him Marquis of Ischia, with a pension of 3,000 scudi.

As a man Canova was active, open, mild, obliging, and kind toward everybody. His opinion of himself was very modest, notwithstanding his fame was spread through all Europe. He assisted promising young artists, and established prizes for the encouragement of the arts. When the Pope conferred upon him the title of Marquis of Ischia, with a pension, he dedicated the whole of the latter to the support and encouragement of poor and deserving artists. Canova was also an agreeable painter, but, strangely enough, more of a colorist than a correct designer. See lives of Canova by Ciognara (1823); Missirini, (1824); the biographies of Rosini (1825); D'Este (1864). Engraved representations of all his works have appeared in Italy and at Paris.

Canovai, Stanislao, stän-īs-lä'ō kā-nō-vā'ē, Italian ecclesiastic and historian: b. Florence, 27 March 1740; d. there, 17 Nov. 1811. Having

taken holy orders, he officiated afterward as professor of mathematics at Parma. In 1788, as a member of the academy of antiquities, he contended for the prize which was offered for an essay on Americus Vesputius. He opposed the common opinion that Columbus was the first discoverer of the new world, claiming that Vesputius one year before him had touched upon the northern part of the continent and had landed in Brazil. His paper gained the prize, but produced much discussion.

Canovas del Castillo, Antonio, än-tō'nē-ō kā'nō vās dël käs tēl'yō, Spanish statesman and man of letters: b. Malaga, 8 Feb. 1828; d. Santa Agedo, 8 Aug. 1897. He was editor of the Conservative journal, 'Patria,' and in 1854 entered the public service as member of the Cortes; thereafter he held various posts in the government. At his death he had been for two years prime minister, and had held the same position three times previously. He is author of 'Literary Studies' (1868); 'History of the Austrian Dominion in Spain' (1869); 'Problems of the Time' (2 vols. 1884); 'Studies on the Reign of Philip IV.' (3 vols. 1888-90). He was editor-in-chief of a 'General History of Spain,' consisting of monographs by sundry writers (1890-7). He was assassinated at the baths of Santa Ageda. See Pons y Humbert, 'Canovas del Castillo' (1901).

Canrobert, François Certain, frän swä sër-tän kan-rō-bär, marshal of France: b. St. Cere in Lot, 27 June 1809; d. Paris, 28 Jan. 1895. He was educated in the military academy of St. Cyr, and in 1828 entered the army. He had seen nearly 20 years' brilliant service in Algeria, and had actively supported the future emperor at the *coup d'état* of 1851, when he received the rank of a general of division in 1853. As such he commanded the first division of the French army under Marshal St. Arnaud, sent to the Crimea in 1854; and at the battle of the Alma was wounded in the breast and hand by the splinter of a shell. On St. Arnaud's death, nine days later, Canrobert assumed the chief command of the French army. According to the historian Kinglake, he deliberately retarded the progress of operations, let slip many opportunities, and hampered the English—his object being to forward Napoleon's design of coming out to head a final and victorious campaign. In the war in Italy against the Austrians (1859) Canrobert had the command of the third division of the French army, and at the battles of Magenta and Solferino his *corps d'armée* was engaged. In the Franco-German war of 1870 he was shut up in Metz with Bazaine, and became a prisoner in Germany. He was an ardent Imperialist till the death of the Prince Imperial (1879). In 1876 he became a member of the Senate. See Martin, 'Le Maréchal Canrobert.'

Can'so, Gut or Strait of, a narrow strait or channel, about 17 miles long and 2½ miles in width, separating Nova Scotia from Cape Breton island. It is navigable by the largest ships, and its scenery is very beautiful.

Canstadt, kän'stät, the name given, from Cannstatt or Canstatt, Germany, to the dolichocephalic or long-headed man of the Quaternary age, whose existence was inferred from a piece of skull found near there in 1700.

Canstein, Karl Hildebrand von, kārĭ hīl'-dē-brānt fōn kār'stīn, German founder of a famous establishment for printing Bibles: b. Lindenberg, 1667; d. 1719. He studied at Frankfort-on-the-Oder, traveled much in Europe, went in 1688 to Berlin, where he was appointed page of the Elector of Brandenburg, and served as a volunteer in the Netherlands. A dangerous sickness obliged him to leave the military service. He went to Halle, where he became familiarly acquainted with Spener and Francke, and became eager to spread a knowledge of religion among the common people. He was especially anxious that the poor should have Bibles at as low rate as possible, and thus originated the famous institution, called the Canstein Bible Institution, which after the death of Canstein in 1719 became associated with the institutions founded by Francke, and still continues its benevolent operations.

Cant-timbers, in ship-building, those timbers which are situated at the ends of a ship. They derive their name from being *canted*, or raised obliquely from the keel, in contradistinction from those the planes of which are perpendicular to it.

Cantabile, kār-tā'bī-lā, in music, a term applied to movements intended to be performed in a graceful, elegant, and melodious style.

Cantabri, kār-tā'brē, the rudest and most valiant of all the Iberian tribes, who dwelt in the ancient Hispania Tarraconensis, and inhabited the greater part of what is now La Montaña and the northwest part of the present province Burgos. In ancient history Cantabri is generally used to denote all the inhabitants of the northern mountains of Spain. Cantabria is the name which was given to the country they inhabited. Oceanus Cantabricus is the ancient name of the Bay of Biscay. Cantabrian Mountains is the general name of the various mountain ranges extending from the western Pyrenees along the north coast of Spain to Cape Finisterre. The highest of the ranges, the Sierra d'Aralar, attains an altitude of 7,032 feet. These mountains are imperfectly known, but in parts they are covered with magnificent forests, and from those of Santander the snow never entirely disappears.

Canta'bria. See CANTABRI.

Canta'brian Mountains, the general name of the various mountain ranges extending from the western Pyrenees along the north coast of Spain to Cape Finisterre. They attain in some parts a height of about 9,000 feet, and are rich in minerals, especially copper, lead, iron, and gold. Large forests of oak, chestnuts, and other trees are also found on their slopes.

Cantaczenus, kār-tā-koo-zā'noos, John, Byzantine emperor and historian: b. about 1300; d. about 1383. While minister of Andronicus III. he negotiated a favorable peace with the Genoese in 1336, and repelled the encroachments of the Turks in 1337. On the death of Andronicus in 1341 Cantaczenus became regent during the minority of the young emperor, John Palæologus. He defeated the Bulgarians and Turks, assumed the diadem, and entered Constantinople, victorious over his rivals, in 1346. He used his power with moderation, and endeavored to heal the wounds which five years of civil war had inflicted on the

state; but religious disputes, civil dissensions, and foreign enemies soon disturbed his government; and the jealousy of Palæologus, the rebellion of his own son, war, plague, the frightful disorders which prevailed in the empire, and his own loss of popular favor, induced him to renounce the crown. He retired to a monastery (1355), where he employed himself in literary labors. He is considered one of the greatest among the successors of Constantine. His 'Four Books of Byzantine History' were printed in 1645, and belong to the collection of the Byzantine historians. His other works, principally theological, are partly printed and partly in manuscript.

Cantal, kār tāl, France, a central department, area, 2,217 square miles; capital, Aurillac. It is named from its highest mountain, the Plomb du Cantal, Mons Celtorum of the ancients, which rises to the height of 6,094 feet. The department is one of the poorest and least productive districts of France. The climate is rather severe near the mountains. Agriculture is in a backward state. The principal crops are rye, buckwheat, potatoes, and chestnuts, and some hemp and flax. Of wheat and oats the product is insufficient for the consumption. Cattle, sheep, horses, and mules are raised in large numbers; and on the refuse of the dairies numerous pigs are fed. The fat cattle from this department are much esteemed, and are sent to all parts of the country. Large quantities of cheese are made, and sold principally in the south of France under the name of Auvergne cheeses. The minerals, as a whole, are unimportant. Hot mineral springs are abundant, those of Chaudes-Aigues being the most frequented. The manufactures are of trifling importance. Cantal is divided into four arrondissements, containing 23 cantons and 267 communes. Pop. (1901) 218,941.

Can'taloupe, a small round variety of musk-melon, globular, ribbed, of pale-green or yellow color and of delicate flavor; first grown in Europe at Cantalupo, in Italy. See MUSK-MELON.

Cantalupo, kār-tā-loo'pō, Italy, a town of Naples, province of Sannio or Molise, memorable for a French victory over the Neapolitans in 1798, and for a destructive earthquake, in which many lives were lost, in 1805.

Cantani, kār-tā'nē, **Arnoldo**, Italian physician: b. Hainsbach, Bohemia, 15 Feb. 1837; d. Naples, 7 May 1893. He was educated at Prague, and was physician in the general hospital there. In 1864 he became professor of pharmacology and toxicology at Pavia; in 1867 he was director of the clinical institute at Milan, and in 1868 of that at Naples. In 1889 he became a senator of Italy. He investigated chiefly malaria, typhus, and tuberculosis; and was influential in introducing the methods of German medicine into Italy. He wrote 'Manuale di Materia Medica e Terapeutica' (1865); 'Manuale di Farmacologia Clinica' (1885-90).

Cantarini, **Simone**, sē mō nā kār-tā-rē'nē, also known as IL PESARESE, Italian painter: b. Pesaro, 1612; d. Verona, 1648. He studied under Guido Reni at Bologna, where he afterward painted a large number of pictures, all much in the style, but without the grace and delicacy, of his master's work. His 37 etchings

CANTARO — CANTERBURY

more closely resemble those of Guido. Throughout his life Cantarini's intolerable arrogance made him numerous enemies; and after a quarrel with his chief patron, the Duke of Mantua, he died in Verona. Among his best-known paintings are an 'Assumption'; 'A Holy Family'; and 'Joseph and Potiphar's Wife.'

Canta'ro, kân-ta'rô, a measure of weight and capacity. As a measure of weight it equals in Turkey 124.7 pounds, in Egypt 98 pounds, in Malta 175 pounds, etc. The Turkish cantar as a measure of capacity equals about 31.5 gallons. The Spanish wine-measure cantaro is about three and a half gallons.

Cantata, kân-tâ'ta, in music, a species of vocal composition, consisting of an intermixture of air, recitative, duet, trio, quartette, and chorus. According to some, it was invented by Carissimi about the middle of the 17th century. By others its invention has been ascribed to Barbara Strozzi, a Venetian lady, in the 18th century. The subject may be sacred, pastoral, or amatory, and in the hands of some composers it takes the dimensions of a short oratorio or opera, but without acting. Mozart, Beethoven, Mendelssohn, and other great musicians have composed cantatas, and among English composers we may mention Purcell, Sterndale Bennett, Macfarren, and Henry Smart.

Canteen, in the United States army, (1) a soldier's tin flask, containing two to three pints, and covered with a woven fabric; (2) a co-operative store, at a camp or garrison, where spirituous liquors are on sale under certain regulations. In British use the canteen is not a refreshment-bottle, but a sort of combination pan, dish, and plate, for use at mess. The departments of the British garrison store are usually divided into a dry canteen and wet canteen, the former being for general groceries and provisions, and the latter for liquid refreshment, excluding spirituous liquors.

Previous to 1901, beer and wine were allowed to be sold at the canteens in the United States army, though spirits were prohibited. In that year an anti-canteen law went into effect, as the result of temperance agitation. There has been wide discussion as to the merits and demerits of this law. The National Anti-Saloon League, at its annual session in Washington, in December 1902, adopted an address containing an argument favoring the law, as follows:

"The official reports of courts-martial show that the trials per 1,000 men more than doubled during the last three years of the canteen liquor-selling law, increasing from 52 per 1,000 men in 1898 to 100 in 1900, and that since the year 1900 (in which is included six months of the canteen liquor-selling and eighteen months of non-selling), the courts-martial have decreased to 61—that is, have decreased 39 per 1,000 men. The reports of the surgeon-general of the army show a marked decrease of disease . . . about 25 per cent. The same reports show a startling decrease in insanity of about 33 per cent."

During the time of the League's agitation the 'Army and Navy Journal' gave editorial utterance to the following, voicing another view of the situation:

"The adjutant-general of the army, in his annual report, states that since the canteen was abolished intoxication and offenses due to intoxication have greatly increased, and he declares it as his serious opinion that the increase of desertions and of trials for infractions of discipline is due in large degree 'to the abolition of the former privileges of the exchange.' The belief, which appears to be seriously entertained in some quarters, that the closing of the canteens has lead to a de-

creased consumption of liquor by the soldiers is ludicrous to the last degree. It is flatly refuted by a few simple facts. Immediately adjacent to the various posts of the army there are nearly 1,500 saloons, most of them dens of vice, where the liquor dispensed is of the vilest quality. The number of these places was increased by nearly 300 during the last fiscal year. . . . The nearly universal opinion appears to be that the abolition of the canteen was a mistake, and that its restoration would be a step in the direction of temperance and good order."

The United States Congress in 1902 appropriated \$500,000 to build and maintain suitable buildings at army posts, for the recreation and sociability of the men, and also increased the rations five cents per day, to enable them to procure more delicacies without depending upon the profits of a liquor-selling canteen. When these buildings come into general use, and statistics can be had for a longer period, it will be possible to form a more accurate opinion as to the wisdom of abolishing the canteen.

Canterbury, England, cathedral city, and parliamentary, municipal, and county borough in Kent, 55 miles southeast of London, on the river Stour. It is supposed to have been a place of importance before the Roman invasion, the Roman name *Durovernum* showing apparently the British prefix *Dur*, water, although antiquaries differ as to the remainder of the compound. Druidical remains have been found here, together with the British weapons termed celts. Its importance under the Roman dominion is proved by many circumstances; and especially by the discovery of a great variety of remains of that people; added to which, Roman bricks have been found in certain portions of the remaining walls. It derives its present name from the Saxon *Cant-wara-byrig*, the Kentishmen's city. During the residence of Ethelbert, king of Kent, the memorable arrival of St. Augustine took place in 596; an event rapidly followed by the conversion of this king and his people to Christianity; and the foundation of the archiepiscopal see of Canterbury. In the 8th and the three following centuries, the city was dreadfully ravaged by the Danes, and on one occasion, in 1011, nearly the whole of the inhabitants, including women, children, and the archbishop himself, were barbarously massacred, and the cathedral burned to its bared walls. It gradually, however, recovered, and at the Conquest its buildings exceeded in extent those of London. The ecclesiastical importance of the place, in particular, advanced with great rapidity, which was consummated by the murder of Thomas à Becket, whose canonization by the Pope rendered Canterbury the resort of pilgrims from every part of Europe. Not only were the priory and see benefited by the offerings of the rich devotees, but the prosperity of the town itself was greatly advanced by the money spent in it by so many wealthy strangers. Erasmus describes the church, and especially the chapel in which he was interred, as glittering with the gold and jewels offered up by the princes, nobles, and wealthy visitors of his shrine; all of which Henry VIII. appropriated to himself on the dissolution of the priory in 1539, when he ordered the bones of Becket to be burned to ashes. Several of the English monarchs have made a temporary residence at Canterbury, which was also occupied by Oliver Cromwell in the civil wars, whose troopers made a stable of the cathedral.

CANTERBURY — CANTHOPLASTY

Canterbury is beautifully situated in a fertile vale, surrounded by gentle eminences, which supply numerous streams of excellent water. The principal thoroughfare is wide, the houses well built, and the streets in general well paved and lighted. It extends about half a mile east to west, and rather more north to south, with four suburbs at the four cardinal points. From all points Canterbury presents a picturesque appearance, its antique features contrasting finely with the sylvan scenery around. The most remarkable object in the city is the cathedral, one of the finest ecclesiastical structures in England. The original building, of which no part now remains, was of great antiquity, the distinction having been claimed for it of being the first Christian church in the kingdom. The present edifice, 530 feet in length, east to west, and 154 in breadth, has been built in different ages (the oldest part dating from the 11th century), and presents in consequence various styles of architecture (including the Norman and Early English), but retains altogether an imposing appearance. The great tower, 235 feet in height, is one of the most beautiful specimens of the Perpendicular style of Gothic; and the choir is also very fine. St. Augustine's monastery, restored and enlarged, is now a church missionary college. St. Margaret's Church has been restored in excellent taste; and the church dedicated to St. Martin, on a hill in the eastern quarter of the city, is believed to be one of the oldest existing Christian churches, and has also been restored. Other public buildings are the guild-hall, the corn-exchange, and a theatre. In addition to the royal grammar-school, founded by Henry VIII., there are numerous other schools, a mechanics' institution, museum and free library, an hospital, dispensary, and numerous other charitable institutions. In 1882 Sidney Cooper, R.A., presented an art gallery to the city. Canterbury was formerly noted for its silk manufactures, afterward supplanted by a superior kind of damask linen, which in turn has become extinct. There are several extensive breweries and malting establishments in the town, and leather, bricks, lime, ropes, etc., are manufactured. The principal articles of trade are corn and hops, in the cultivation of the last of which a number of the laboring class are employed. There are extensive barracks for cavalry and infantry. Canterbury sent two members to the House of Commons from Edward I.'s reign till 1885, when it lost one.

The Archbishop of Canterbury is primate and metropolitan of all England, and first peer in the realm after the royal family. He places the crown on the sovereign's head at the coronation, and wherever the court may be the king and queen are deemed his parishioners. The four prelates of London, Winchester, Lincoln, and Rochester, are respectively his provincial dean, sub-dean, chancellor, and chaplain. His province comprehends the sees of 24 suffragan bishops, and he has the nomination of the several officers belonging to the ecclesiastical courts over which he presides, and the privilege of conferring degrees in the faculties of law and divinity; formerly (till 1858) also of medicine. Pop. (1901) 24,868. See Willis, 'Architectural History of Canterbury Cathedral' (1845-69); 'Historical Memorials of Canterbury Cathedral' (1855); Gleeson White (1896); Evans and Goldney, 'Canterbury' (1899).

Can'terbury, New Zealand, a provincial district occupying the centre of South Island; capital, Christchurch. The famous Canterbury Plain, of 2,500,000 acres, slopes gradually down over a descent of 40 miles toward the sea. A rich loamy tract, admirably adapted for agriculture and cattle grazing, extends along the east coast, while the interior is a true pastoral country, well watered by numerous streams, and covered with a perpetual herbage of various grasses. A vast coal-field seems to underlie the whole country, and coal is worked in the districts of Timaru and Malvern. Good fire-clays, quartz, sand for glassmaking, marble, limestone, etc., are also found. The productions include wool, grain, frozen meat, skins and hides, butter, cheese, and some silk. The colony of Canterbury was established in the year 1850 mainly by members of the Church of England. Area, 14,040 square miles. Pop. (1901) 143,040.

Canterbury-bell, a name given to species of *Campanula* (q.v.), especially *C. medium* and *C. trachelium*.

Canterbury Tales. See CHAUCER.

Cantharel'lus. See FUNGI. EDIBLE.

Cantha'rides, kăn-thă'ri-dēs, blister-beetles (q.v.) when prepared for medical use. Our native American blister-beetles (especially *Epicauta vullata* and *cinerca*) are not inferior to the Spanish-fly in vesicant qualities. By a strange misconception the presence of the brilliant green particles of the wing-cases in the powdered imported insect has been associated with their activity, and any sample of powdered cantharides or of prepared emplastrum where these brilliant particles are wanting would be condemned by many physicians. The recent introduction of the Chinese beetle (*Mylabris cickorn*) has done much to remove this misconception, for it has been shown that the *Mylabris* is much stronger than *Lytta vesicatoria*, yielding, according to analysis, fully double the quantity of cantharidin. Our native blister-beetles, when powdered, nearly resemble the *Mylabris* in color. (Saunders, 'Notes on Cantharides,' 'Canadian Entomologist,' Vol. VIII., December 1876.)

Cantha'ridin ($C_{10}H_{10}O_4$), the vesicating principle of cantharides. The methods of obtaining it consist in treating the powdered insects with a solvent, such as alcohol, ether, or chloroform, the last being preferable. The solution is evaporated, and the residue is purified from a green oil which adheres to it obstinately, by digesting with bisulphide of carbon or by redissolving in alcohol. Purification is further effected by animal charcoal, and the cantharidin is crystallized from hot alcohol or chloroform. It forms white crystalline scales, which fuse when heated and sublime, evolving an extremely irritating vapor. It is insoluble in water, but when mixed with the oils from the insect it is soluble. Chloroform is its best solvent, but it is taken up more or less freely by alcohol, ether, mineral acids and alkalies, and a variety of organic fluids. From most of these it is reprecipitated unchanged by diluting with water, or by neutralizing with the necessary reagent.

Can'thoplasty (Gr. *kanthos*, "the angle of the eye," and *plastikos*, "formative"), the formation by plastic operation of the angle of the

CANTERBURY CATHEDRAL.

Photograph by J. Horace McFarland Co.

CANTICLES — CANTO FIGURATO

eye, an operation proposed by Ammon when the eyelids are not sufficiently cleft, or when the eyelids produce tension on the eyeball, as in inflammatory processes.

Canticles, or Song of Songs (*Shirhashirim* in Hebrew, the *Canticum Canticorum* of the Vulgate), the fourth book of the Hagiographa, and the first of the so-called Megilloth, has its name of Song of Songs, from the superior beauty of its language and poetry. In a number of dialogues and soliloquies, written in most harmonious verses, it gives a glowing description of the tender, chaste, and faithful love, as well as of the beauty of two lovers betrothed, or bride and bridegroom; of rural scenes among the mountains of Lebanon and Hermon, among the hills and vineyards of Engedi, and in the environs of Jerusalem and Thirza; and of love itself, sweeter than wine, more fragrant than ointments, which cannot be bought, nor quenched by waters, nor drowned by floods. It is ascribed to Solomon, whose palaces, gardens, chariots, horses, guards, and wives are mentioned, enhancing by the contrast, the charms of calm rural life, full of song, innocence, and love. In regard to its form, its plot, and the order of its parts, as well as to its subject, it has been variously classified by ancient and modern writers; by Origen, in the preface to his comments, as an epithalamium in the form of a drama, which is also the opinion of Lowth and Michaelis; by Bossuet as a regular pastoral drama of seven acts, giving the scenes of seven days, of which the last is the Sabbath; by others as a collection of songs or idyls. Dr. Adam Clarke regards it as a poem *sui generis*, composed for the entertainment of marriage guests. Its canonicity has also been a matter of controversy; it seems to have been in question with the Jews at the time of the Mishna. Theodore of Mopsuestæ, the friend of St. Chrysostom, attacked it most vehemently with arguments derived from the erotic character of the book, and was severely condemned for his attacks. Origen, who is said to have written 10 books of comments on the Canticles, containing no less than 20,000 verses, and his admirer Jerome, are among its most prominent defenders, supported by the circumstance that the book is contained in all the Hebrew copies of the Scriptures, in the translations of the Septuagint, of Symmachus the Jew, and of Aquila, and is mentioned in the most ancient catalogues of the Church, commencing with that of Melito, bishop of Sardis, who lived in the 2d century, though not expressly by Josephus. Modern criticism has also questioned the authorship of King Solomon, and several Aramaic words, the *yod* in the word David, and the abbreviation of the relative *asher*, etc., have been quoted as evidences against the generally accepted antiquity of the book, though none of these is conclusive. But no subject has excited more and livelier controversies, or has been a source of more learned and contradictory disquisition and scrutiny, than the question of the literal or allegoric and mystic sense of the book. Many modern critics both among Jews and Christians, not unsupported by the opinions of ancient and grave authorities, contend for the literal sense. They also widely differ in the interpretation of the meaning and object of the book. These writers account for its reception into the canon on the ground of its praise of faithful

love, of conjugal affection, and the chastity of monogamy, or of a misunderstanding of the collectors. The more ancient opinion, on the other hand, which is alone regarded as orthodox in both Church and synagogue, defends the allegorical, religious, and sacred character of the songs. Thus, on the one side the subject is the love of a shepherd, of a youthful king, etc., and the beloved is a shepherdess, an Ethiopian princess, or, according to Grotius and others, the daughter of Pharaoh, wife of Solomon; while, on the other side, love appears as a spiritual affection, as the love of the God of Israel for his chosen but abandoned people, according to the Chaldee paraphrast, the rabbis, and even Luther; of Christ for the Church, between the soul of the believer and Christ, or as the connection between the divine and human nature, according to views current in the Church. Aben Ezra, a Jewish philosopher of the 12th century, finds in the book the hopes of redemption for oppressed Israel; Keiser, the restoration of the Mosaic law by Zerubbabel and Ezra; Hug, an attempt made in the time of Hezekiah to reunite the remnant of the 10 tribes to Judah; others, the love of wisdom; the alchemists, even the search for the philosopher's stone. Dr. Kirschbaum, of Cracow, brings the book down to the time of Hadrian, finds in it the last outbreak of Jewish patriotism and love of liberty, and in the *harai bathar* the mountains of Bethar, so heroically defended by Bar-Cokeba. Besides the authors above mentioned who have written upon the Canticles, the names of Erasmus, Le Clerc, Rosenmüller, Eichhorn, Jahn, De Wette, Ewald, Robinson, Stuart, Delitzsch, Renan, Siegfried, Cheyne, and Black, must be mentioned. Mendelssohn and Dr. J. Mason Good have published admirable translations. Of those of Jerome only one is extant.

The name of canticles is also given to certain detached psalms and hymns used in the service of the Anglican Church, such as the *Venite exultemus*, *Te Deum laudamus*, *Benedicite omnia opera*, *Benedictus*, *Jubilate Deo*, *Magnificat*, *Cantate Domino*, *Nunc dimittis*, *Deus miseratur*, and the verses used instead of the *Venite* on Easter Day.

Can'tilever, a wooden or iron block framed into the wall of a house, and projecting from it to carry moldings, eaves, balconies, etc. The name is given also to a large projecting framework forming part of an iron bridge. See **BRIDGE**; **BRIDGE CONSTRUCTION**.

Cantium, cãn'ti-ũm, England, an ancient territory in South Britain, whence the English word Kent is derived, supposed to have been the first district which received a colony from the Continent. The situation of Cantium occasioned its being much frequented by the Romans, who generally took their way through it in their marches to and from the Continent. Few places in Britain are more frequently mentioned by the Roman writers than Rutupia (now Richborough). Portus Dubris (now Dover), Durobrivæ, and Durovernum (now Rochester and Canterbury) were also Roman towns and stations. Cantium made a part of the province called Flavia Cæsariensis. See **KENT**.

Canto Figurato, fê-gũ-rã'tô, a term applied by the old Christian ecclesiastics to the chant in its more florid forms, or in which more than one note was sung to a syllable.

CANTON

Canton, John, English electrician: b. Stroud, 31 July 1718; d. 22 March 1772. He settled as a schoolmaster in London, and was elected a Fellow of the Royal Society in 1749. He invented an electroscope and an electrometer; originated experiments in induction; was the first to make powerful artificial magnets; and in 1762 demonstrated the compressibility of water.

Can'ton, William, English writer: b. Isle of Chusan, China, 27 Oct. 1845. He was educated in France for the Roman Catholic priesthood, but decided upon a secular career and was for many years on the staff of the *Glasgow Herald*. Since 1890 he has been sub-editor of the 'Contemporary Review' and manager of the London publishing house of Isbister & Company. He is author of 'A Lost Epic and Other Poems' (1887); 'The Invisible Playmate,' a strikingly original piece of work (1894); 'W. V., Her Book, and Various Verses' (1896); 'The Invisible Playmate, and W. V., Her Book' (with final chapter) (1897); 'A Child's Book of Saints,' republished in the United States as 'W. V.'s Golden Legend' (1898); 'Children's Sayings' (1900).

Canton', China (more correctly *Quang-chow-foo*), a large and important city, situated on the Pearl River, at a distance of 80 miles from the sea. It is situated in the province of Quang-tung (of which name Canton is a corruption), and consists of the city proper and of many suburbs, and its total population is estimated at from 500,000 to 2,500,000. The city proper is enclosed by walls, forming a circuit of six miles, and is divided into two parts by a partition wall running east and west; the portion north of this wall, which is much the larger, being called the old, that on the south of it the new city. The walls, mainly of brick, rise to the height of 25 feet, with a thickness of about 20. There are 12 gates, all of which are shut at night. The streets are long and straight and in general paved with flat stones, but they are very narrow, the average breadth not exceeding eight feet. The houses of the poorer classes are mere mud hovels; those of the shop-keeping class are commonly of two stories, the lower of which serves as the shop. The streets are to a great extent lined with these shops, in which are to be found the productions of all parts of the globe. Neat and gaudily painted signs and names give a gay appearance to the narrow streets; in most cases there are no windows in front, but the whole is thrown open by day and closed at night. Temples and other religious edifices are very numerous, but few of them are in any way remarkable. There are two lofty pagodas, forming a notable feature in any general view of the city. One of these, 170 feet high, is about 1,300 years old, the other, 160 feet high, about 1,000. Among the chief temples, which are far from attractive buildings, may be mentioned those of the Ocean Banner, of the Five Hundred Gods, of Longevity, of the Five Genii. Among other buildings may be mentioned the residences of the governor-general, the commander-in-chief, the treasurer, the prefect, etc. There are four large prisons, one of them capable of holding 1,000 prisoners. In the European quarter are churches, schools, and other buildings in the European style. Wheeled carriages are not in use in Canton; goods are transported on bamboo poles

laid across the shoulders of men, while people who can afford it have themselves carried about in sedan-chairs. The river opposite the city for the space of four or five miles presents a most interesting scene. The prodigious number of boats with which it is crowded is the first thing that strikes the eye. A large number of these—as many, it is said, as 40,000, containing a population of 200,000—are fixed residences, and most of them moored stern and stern in rows. The inhabitants are called tankia or boat-people, and form a class with many customs peculiar to themselves. Millions are born and live and die in these floating dwellings without ever having put foot on dry land; while their ancestors for generations were all amphibious like themselves. The family boats are of various sizes, the better sort being from 60 to 80 feet long, and about 15 feet wide. A superstructure of considerable height, and covered with an arched roof, occupies nearly the whole of the interior of the boat. This structure is divided within into several apartments, devoted to different domestic purposes, all of them being kept very clean. The smaller boats of this description are not above 25 feet long, and contain only one room. By far the handsomest boats are the hwa-ting or flower-boats, which are graceful in form and have their raised cabins and awnings fancifully carved and painted. These are let to pleasure-parties for excursions on the river. The foreign mercantile houses, and the American, British, and French consulates have as their special quarter an area in the suburbs in the southwest of the city, with water on two sides of it. The river banks are faced with a granite wall; handsome hong or factories have been built, and much money has been spent on improvements. The manufactures and other industries of Canton are varied and important, embracing silk, cotton, porcelain, glass, paper, sugar, lacquered ware, ivory carving, metal goods, etc. The direct trade between the United States and Canton is constantly growing, the exports and imports for 1902 being upward of \$15,000,000 and \$10,000,000 respectively. Its foreign trade has been known for three centuries throughout the world, and it was the chief foreign emporium in China until 1850, when Shanghai began to surpass it. Since then the opening of other ports and different causes have interfered with its prosperity, but it still carries on a large traffic, its exports and imports together often amounting to about \$40,000,000. Business transactions between natives and foreigners are transacted in a jargon known as "pidgin-English." Since the establishment of the colony of Hong Kong there has sprung up quite a flotilla of river steamers, which ply daily between Canton, Hong Kong, and Macao, and convey the greater part of the produce and merchandise for native and foreign consumption. These steamers equal the best river boats of Europe, and carry large numbers of passengers. The climate of Canton is healthy; in July and August the thermometer may rise to 100° F. in the shade, and during winter it is at times below the freezing-point. Canton was first visited by English vessels in 1634. From 1689 to 1834 the East India Company had a monopoly of the English trade. In 1839 war was declared by Great Britain against China, and Canton would have been occupied but for being ransomed by the Chinese. In the war of 1856 the foreign factories were pillaged

CANTON — CANUTE THE GREAT

and destroyed, and about a year after this Canton was taken by an English force. From this time to 1861 it was occupied by an English and French garrison. Since then it has been open to foreign trade.

Can'ton, Ill., city of Fulton County, situated on the Chicago, B. & Q. and the Toledo, P. & W. R.R.'s. It is the centre of trade of a fertile agricultural region; and has numerous industrial interests, including a large manufactory of agricultural implements, cigar factories, etc.; a public library and a high school. There are coal mines within the city limits. Pop. (1900) 6,564.

Canton, N. Y., a village and county-seat of Saint Lawrence County, on Grass River, and the Rome, W. & O. R.R., 59 miles northeast of Watertown. It is the seat of St. Lawrence University, and has large flour and lumber interests, a national bank, weekly newspapers, several churches, and an assessed property valuation of over \$3,000,000. Pop. (1900) 2,757.

Canton, Ohio, city and county-seat of Stark County, on Nimisilla Creek and the Pennsylvania, the Baltimore & O., and the Cleveland, C. & S. R.R.'s; 60 mls. south of Cleveland. It is in a fine fruit and wheat-growing district, with coal, limestone, and pottery clay in the vicinity, and was for many years the residence of President McKinley whose tomb is here. It is a manufacturing city of considerable importance. The principal industries are the manufacture of agricultural implements, brick and tile, foundry and machine-ship products, iron bridges, steel goods, and stoves. There are three national banks, besides several State and savings banks. The city has an electric light and street railway system, and well-paved streets. Among the notable buildings are the post-office, high school, public library, the United States signal service station, and several churches. Pop. (1900) 30,667.

Canton, S. D., the capital of Lincoln County, on the Sioux River, 20 miles from Sioux Falls. It is on the Chicago, M. & St. P. R.R., and is the seat of Augustana College. The town contains eight churches, public schools, and important manufactories, and is lighted by electric light. Pop. (1900) 1,943.

Canton, a small division of territory, constituting a distinct state or government, as in Switzerland, where each of the 22 states is so designated. In France judicial districts are called cantons.

Canton River. See CHUKIANG.

Cantoni, kán tō'nē, **Carlo**, Italian philosopher: b. Gropello, 1840. He studied law and philosophy at Turin, and philosophy at Berlin and Göttingen (under Lotze). He was professor at the lyceum at Turin, and in Milan; since 1878 he has been professor of philosophy at the University of Pavia. In his philosophical theory he agrees in general with Kant. He wrote: 'G. Battista Vico, studii Virtutis e Comparazione' (1867); 'Corso Elementare di Filosofia' (1870); 'Guiseppe Ferrari' (1878); 'Emanuele Kant' (1879-84).

Canton'ment, the district in which troops are quartered when they are not collected into a camp, but detached and distributed over the

neighboring towns and villages. The object of sending troops into cantonments is to be able to concentrate them as quickly as possible on one spot, when circumstances do not admit of a camp being formed, or do not render it advisable to form one. In India the permanent military stations erected in the neighborhood of the principal cities are so called.

Cantu, **Cesare**, chā-zā-rē kán'too, Italian historian, poet, and philosopher: b. Brisio, 5 Sept. 1805; d. 11 March 1895. He was educated at Sondrio in the Valtellina, where he taught belles-lettres at a youthful age, resided afterward in Como, and next at Milan until 1848. One of his earliest works, entitled 'Ragionamenti sulla Storia Lombarda nel Secolo XVII.' ('Lectures on the History of Lombardy in the 17th Century'), appeared in a second edition in 1842-4, and contained liberal ideas that brought upon the author the animadversion of the Austrian government, which condemned him to a year's imprisonment. During his confinement he composed a historical romance, entitled 'Margherita Pusterla' (1845), which became very popular. His great work, on which his reputation will chiefly rest, 'Storia Universale' ('Universal History'), appeared first in 1837, at Turin. It has been since revised and reprinted at Palermo and Naples, and translated into German. A French translation by Aroux and Leopardi, was published in Paris in 1843. Other works of his are: 'Storia degli Italiani' (1854); 'The Last One Hundred Years' (1864); 'The Italian Heretics' (1866-8). See Bertolini, 'Cesare Cantu e le sue opere' (1895).

Cantus Firmus, an ancient chant of the Roman Catholic Church. These chants were adopted as standing melodies, and until counterpoint was discovered, were unaccompanied, or only harmonized with octaves.

Canuck, a term sometimes used in the United States to denote a Canadian.

Canute IV., Saint, king of Denmark 1080-6. He suppressed the ancient heathen customs of his people, and thus aroused opposition; in 1085 he started on an expedition against William the Conqueror, but was murdered by rebels in his own army. He was canonized in 1101 and in the Middle Ages was considered the patron saint of Denmark.

Canute (ka-nūt') **the Great**, **Knud**, or **Knut**, the second king of Denmark of that name, and first Danish king of England: b. in the former country, about 995; d. Shaftesbury, England, 1035. He was the son of Sweyn, king of Denmark, and accompanied his father in his victorious campaigns in England. Sweyn, having proclaimed himself king of England, died in 1014, before his power was established, and appointed Canute his successor there. The latter was immediately driven out by Ethelred, the representative of the Saxon line, and fled with 60 ships to the court of his brother, Harold, king of Denmark. Harold enabled him to collect a large fleet in the north to prosecute his cause in England. He invaded that country anew in 1015. He fought many battles with Edmund Ironside, who had succeeded his father, Ethelred, in 1016, and was finally victorious at the battle of Assington. After this battle, Edmund and Canute agreed upon a division of the kingdom. To Canute were assigned

CANVAS — CANVAS-BACK

Mercia and Northumbria, while the Saxon prince preserved West and East Anglia. By the death of his brother, Harold, he obtained the crown of Denmark (1016). In the same year, and but one month after the ratification of the treaty of partition, Edmund died, and Canute became sole king of England without further resistance. He refrained from murdering the children of his late rival, and sent them to his half brother, Olave, king of Sweden. He put away his wife, Alfgive, the daughter of the Earl of Northampton, and espoused Emma, the widow of Ethelred, the Saxon monarch (1017), on the condition that their children should succeed to the throne of England. He made the greatest exertions to gain the affections of his English subjects, to whom his Danish origin was no recommendation. He accordingly disbanded his Danish army, retaining only a body-guard. He endeavored to blend the two races as far as possible, and to induce them to live in harmony with each other. He erected churches, and made donations to abbeys and monasteries on the scenes of former conflicts and massacres. In a witenagemote at Winchester, he compiled a code of laws which is still extant. In this code he denounced those who kept up the practice of pagan rites and superstitions, and forbade the sending of Christian slaves out of the country for sale. Although Canute generally resided in England, he made frequent visits to Denmark. He carried with him on these occasions an English fleet, English missionaries, and English artisans. He promoted three Englishmen to the newly erected bishoprics of Scania, Zealand, and Fionia. In 1025 he was attacked by the king of Sweden and defeated; but in the night, Earl Godwin, at the head of the English contingent, surprised the Swedish camp and dispersed the enemy. His absence from Denmark, and the bestowal of so many dignities in Denmark upon his English subjects, made him unpopular in that kingdom. To appease this discontent, he left behind in Denmark his son, Hardicanute, then aged 10 years, under the guardianship of his brother-in-law, Ulf (1026). In this year he made a pilgrimage to Rome. He was well received there by the Pope John, and by the Emperor Conrad II., who gave up to the Danish king all the country north of the river Eider. From the Pope he obtained privileges for the English school established in Rome, and an abatement of the sums demanded from his archbishops for the pallium; and from the various princes, relief for all English and Danish pilgrims and merchants from all illegal tolls and detentions which they had endured on their route to Rome. He returned from Rome to Denmark. In 1028 he made an expedition into Norway, expelled Olave, and restored Haco, who swore allegiance to him. In 1029 he returned to England, and his Danish subjects proclaimed Hardicanute king of Denmark. Canute immediately returned to Denmark, put down the revolt, and executed the traitor, Ulf. In 1031 Canute was acknowledged king of Norway, and laid claims to the crown of Sweden. On returning again to England, he allowed his son, Hardicanute, to share with him the Danish crown. His reign is very important in the constitutional history of Denmark. Canute issued the first national coinage of Denmark, and published the first written code of Danish law, wherein the custom of private vengeance was

prohibited. He raised the clergy in their corporate capacity to a separate estate of the realm, and instituted the Thinglith or royal guard of 3,000 men. The members of this body were all men of good family, and rich enough to equip themselves at their own expense. From them sprang the Danish order of nobility; they were tried only by their peers, and formed with the king the highest court of justice. Canute's last campaign was against Duncan, king of Scotland, respecting the possession of Cumberland, but before the armies could engage the two kings were reconciled, and ancient stipulations concerning the tenure of Cumberland were renewed (1033). Canute was buried at Winchester. By Emma he had two children, namely, Hardicanute or Canute the Hardy, and a daughter, Gunhilda, married to Henry, the son of Conrad II., of Germany, emperor. By Alfgive he left two sons, Sweyn and Harold. To Sweyn was given the crown of Norway; Hardicanute retained that of Denmark, and Harold, surnamed Harefoot, took possession of that of England. Canute is most popularly known, not by his extended rule and legislative enactments, but by the familiar story of the monarch, the courtiers, and the disobedient sea.

Can'vas, a textile fabric made of the fibres of hemp; or any strong, firm cloth, whether of hemp or flax. It is chiefly used for tents, and for the sails of sailing vessels, for which its strength makes it well adapted. Varieties of it are also used as the ground of tapestry work and of oil paintings. A finer description is used for many common domestic purposes, as for towels, table-cloths, etc. Canvas for sails is made from 18 to 24 inches wide, and numbered 0 to 8, No. 0 being the thickest. A bolt is 39 to 40 yards long, and weighs 25 to 48 pounds.

Canvas-back, a widely distributed freshwater duck (*Aythya vallisneria*), much sought as a table luxury, as its flesh is considered superior to that of all other ducks. It is about 22 inches in length and its reddish-chestnut head and neck are much shaded with dusky hues; the lower neck, breast, and forepart of the back, with the rump and tail-coverts, are black; and the back and sides gray, covered with fine lines and dots, so that the plumage resembles canvas. By reason of its similarity, this duck is frequently confounded with the red-head (q.v.). "The canvas-back is larger, its head darker, and its bill a deep black, while that of the red-head is deep blue, or a slatish color. The shape of the bill of the canvas-back is wedged and long; of the red-head moderately long and concave. . . . They are very tenacious of life, their bump of stubbornness being fully developed, and they will dive long distances, and prefer death by any other means than human agency. When one is crippled it will usually look around for an instant, to see where the danger lies, then down it goes, and if rushes or cover are near, it is good-bye to that duck,—it will not be seen again. When one is crippled it should be shot again, and at once." The food of the canvas-back consists chiefly of the roots of wild celery (*Zostera vallisneria*), which resembles the cultivated celery in appearance. It grows densely in the shallow parts of the Chesapeake Bay and Susquehanna River, about the Great Lakes, and in the Mississippi valley. Few canvas-backs are

CANZONE — CAOUTCHOUC

found east of the Hudson and Delaware rivers. It is almost safe to say that where the plant grows in abundance, the canvas-back is almost sure likewise to be found; consequently the peculiarly delicate flavor of its flesh, and the market value of this duck, increase with the amount of celery it consumes, as otherwise it is hardly distinguishable from the red-head in flavor. The canvas-back breeds north of Dakota, building its nest on the ground, in a marsh, and laying from 6 to 10 greenish-buff eggs. Consult: Elliot, 'Wild Fowl of North America'; Job, 'Among the Wild Fowl.'

Canzone, kân-tsō'nā, a lyric poem, of Provençal origin. It is found in the Italian poetry of the 13th century. At first it was quite irregular, but was confined by Petrarch to more fixed and regular forms. Hence it is called *canzone Petrarchesca*; it is also called *canzone Toscana*, because it originated in Tuscany. It is divided into several stanzas, in which the nature and disposition of the verses, which are of 11 and 7 syllables, and the place of the rhymes, are uniform. The canzone usually concludes with a stanza which is shorter than the others, and is called *ripresa*, *comgedo*, *comiato*, signifying dismissal or taking leave. There are different kinds of canzoni, and different names are given to the different parts. The canzone *Anacreontica* is divided into small stanzas, consisting of short verses, with a regular disposition of the rhymes through all the stanzas. Not only light, pleasing songs of love, gaiety, and mirth, but poems on solemn and lofty subjects, and of an elevated dithyrambic strain, are included under this name. The latter subjects, however, are better adapted to the canzone *Pindarica*, which was first introduced in the 16th century, by Luigi Alamanni, and owes its perfection chiefly to Chiabrera. It is distinguished from that of Petrarch by a bolder flight, loftier ideas, greater freedom in the choice and disposition of the verses, and by the form of the stanzas, which is borrowed from the Greek chorus. 'The Pindaric canzoni are divided into strophe, antistrophe, and epode, and are called canzoni alla Greca. Those divisions are sometimes called ballata, contraballata, and stanza; or volta, rivolta, and stanza; the Greek names are the most common. There is also the canzone a ballo, an old Italian poem, originally intended to be sung at a dance (ballo). It is called also ballata. It is not employed by the Italian poets later than the 16th century.'

Canzonet, kân-tsō-nět', **Canzonetta**, in Italian poetry a canzone (q.v.), consisting of short verses, much in use with the poets of the 15th century. Rinuccini, and after him Chiabrera, have used it in modern times, and given it more grace. Canzonets are generally expressive of tender feelings. In music, canzonet signifies a song, shorter and less elaborate than the aria of the oratorio or opera.

Caonabo', kâ-o-nâ-bō', Indian chief of Hispaniola (Haiti) at the time of its discovery by Columbus. The latter built a fort which he called La Navedad, and in which he left, when sailing for Spain early in 1493, a garrison of 40 men — among them one Irishman and one Englishman, as shown by Navarrete's list. Returning before the end of the year, he found that Caonabó had burned the fort and killed the

garrison. According to the account of a friendly native, the Spaniards had drawn this fate upon themselves by their evil conduct. It has been suggested, as a reason for special regret, that we might otherwise have had from the Englishman or the Irishman an eye-witness's description of the first voyage of Columbus, in our own language. In 1494 the Indians in great numbers attacked the Spaniards, having been provoked by the misconduct of one of the lieutenants of Columbus, Pedro Margarite. Columbus overthrew them, first at Magdalena, and later (1495) on the plains of the Vega Real — where, tradition has it, 100,000 hostiles were assembled. Caonabó meanwhile threatened the garrison of St. Thomas. Alonso de Ojeda was sent by Columbus to cajole Caonabó into coming to a conference. Ojeda went alone among the hostiles. As presents he took gyoes and manacles of shining metal; treacherously persuaded the prince to show himself to his subjects wearing these novel ornaments, and even, while thus adorned, to ride Ojeda's horse; then, mounting also, he dashed through the crowd of savages and carried his victim into the presence of Columbus. Sent to Spain for trial, Caonabó died in 1496.

Caoutchouc, koo'chook, an elastic, gum-like substance, obtained from the juice of certain tropical trees and shrubs, and commonly known as India-rubber or "rubber." The best caoutchouc comes from the Para region, in Brazil; but supplies are also obtained from Central America and the West Indies, from Africa, and from tropical Asia. The details of collecting the juice and preparing it for market vary somewhat according to the locality, and with the nature of the trees or shrubs from which the juice is obtained. In the Amazon region, when the source is a tree, incisions are made in the bark each morning, and the milky sap that exudes is collected in little tin or clay cups that are secured to the tree for the purpose. At the end of about 10 hours these are emptied into larger collecting vessels, and on the morning of the following day new incisions are made in each tree, some eight inches below the first ones. This process is continued until incisions have been made in the bark from a height of about six feet down to the ground. The poorest quality of sap is obtained from the highest wounds, and the best from the lowest ones. To evaporate the juice, a fire is first built of materials that yield dense volumes of smoke. A workman then dips a wooden paddle into the collected sap, after which he holds it in the smoke until the sap solidifies and acquires a slight tinge of yellow. He then dips the paddle into the sap supply again, repeats the smoking process, and so proceeds until the paddle is covered with a layer of the dried gum that is perhaps an inch and a half thick. He then slits this layer, removes it from the paddle, hangs it up to dry, and starts a fresh evaporation.

Pure caoutchouc from Para is light-colored below the surface, but superficially it is dark brown from oxidation. It has a specific gravity of about 0.92, and consists chiefly of carbon and hydrogen in the proportion of about 87 per cent of carbon to 13 of hydrogen. Small quantities of oxygen are always present, however, as the best of the Para product contains as much as one half of 1 per cent of a sort of resin that

contains oxygen, and is undoubtedly produced by the oxidation of the gum. In fact, it is known that caoutchouc will oxidize slowly in damp air, even after it is vulcanized, and particularly when exposed to the action of light. Caoutchouc consists, apparently, of two different kinds of gum, one of which is fibrous, while the other is viscous, though the two are chemically identical. It is slightly soluble in ether, turpentine, chloroform, petroleum, naphtha, benzene, and carbon disulphide, the viscous portion being more soluble than the fibrous part. At 250° F. caoutchouc begins to melt, and becomes permanently transformed into a sticky substance which retains its peculiar consistency almost indefinitely. At 400° F. the transformation is more complete, and the black, adhesive mass that results makes an excellent lute for sealing glass bottles and jars if it is thoroughly incorporated with 50 per cent of its own weight of dry slaked lime. By careful destructive distillation caoutchouc is resolved into a number of hydrocarbon oils that are of interest to the chemist.

As early as 1615 the Spaniards used the crude gum "for waxing their cloaks, which were made of canvas, so as to make them resist water." But it was not until about 200 years later that caoutchouc began to attract general attention in such ways. At first it was applied to cloth by the aid of heat; but improved methods followed the discovery of solvents for the gum, and the invention, by an Englishman named Thomas Hancock (about 1820), of the "masticator," a machine by which the caoutchouc is thoroughly worked over and brought to a uniform consistency. But the greatest step in the development of the rubber industry was the discovery of the process of vulcanization,—a discovery that appears to have been made independently and at about the same time (1843) by Charles Goodyear, of New Haven, Conn., and Thomas Hancock, to whom reference has previously been made. The credit of priority belongs to Goodyear, but Hancock did a great deal to make the discovery a commercial success. Unvulcanized caoutchouc is softened by heat, and is made hard and inelastic by cold; but upon being vulcanized the gum becomes comparatively insensible to ordinary extremes of temperature, and also has its elasticity materially increased. The process of vulcanization depends upon the fact that the crude rubber will absorb sulphur, and combine with it at a temperature that is easily attainable without injury to the product. The details of the vulcanization differ somewhat, according to the nature of the article that is being manufactured. If sheet rubber is submerged for a few moments in melted sulphur at a temperature of 250° F., it absorbs about one tenth of its weight of that element; but although its color changes somewhat it is otherwise apparently unaltered. Upon exposure for a somewhat longer time to a temperature of 285° F., however, true combination of the sulphur and caoutchouc ensues, and the gum is said to become "vulcanized." It is not necessary that the sulphur should be actually melted in order that the sheet rubber may absorb it, for sheets that are laid in powdered sulphur that is heated nearly to its melting-point will absorb the proper amount for good vulcanization in the course of a few hours.

Vulcanization of rubber sheets can even be brought about without the action of heat, by dipping the sheets for a few seconds in a solution of chloride of sulphur in carbon disulphide. It is more common, however to knead the requisite amount of sulphur directly into the caoutchouc by mechanical means. The article to be manufactured is then brought into shape by the action of pressure and moderate heat (or in any other manner), and the final operation consists in heating it to the vulcanizing temperature by the aid of a steam bath. Chemically considered, the process of vulcanization appears to consist in the substitution of one or more sulphur atoms for a portion of the hydrogen of the hydrocarbons of which the caoutchouc is composed. See INDIA RUBBER; RUBBER MANUFACTURE.

Cap, the cover of the end or head of anything. Caps were not worn by the Romans for many ages. When either the rain or sun was troublesome the lappet of the gown was thrown over the head; and hence all the ancient statues appear bareheaded, excepting sometimes for a wreath or the like. The same usage prevailed among the Greeks, to whom, at least during the heroic age, caps were unknown. The sort of caps or covers of the head in use among the Romans on divers occasions were the *pitra*, *pileus*, *cucullus*, *galerus*, and *pallolum*, which are often confounded by ancient as well as modern writers. The general use of caps and hats is referred to the year 1449. The first seen in Europe were used at the entry of Charles VII. into Rouen. From that time they began to take the place of *chaperons* or hoods. When the cap was of velvet they called it *mortier*; when of wool simply *bonnet*. None but kings, princes, and knights were allowed to use the *mortier*. The cap was the head-dress of the clergy and graduates. Pasquin says that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off, as an incumbrance, left the round cap an easy commodious cover for the head; which cap, being afterward assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman called Patrouillet. He adds, that the giving of the cap to the students in the university was to denote that they had acquired full liberty, and were no longer subject to the rod of their superiors, in imitation of the ancient Romans, who gave a *pileus* to their slaves in the ceremony of making them free: whence the proverb *vocare servos ad pileum*: hence, also, on medals, the cap is the symbol of Liberty, who is represented holding a cap in the right hand by the point.

Cap of Maintenance, one of the ornaments of state carried before the sovereigns of England on the occasion of their coronation. It is also applied to an ornament borne before the mayors of certain cities on state occasions, and to a device in heraldry.

In ship-building a cap is a square piece of timber having two holes cut through it,—one square to fit on the squared or tenon head of the lower mast; the other round, to take the heel of the upper mast. Also a similar contrivance affixed to the end of the bowsprit, through a round hole in which the jib-boom is rigged.

In mining, a mass of unproductive rock overlying valuable ore; and in physical geography,

CAPACITY — CAPE BLANCO

a similar mass, as of ice overlying the surface of a country; as, the ice-cap of Greenland.

For the term as used in military parlance, see PERCUSSION CAP.

Capacity, Specific Inductive, a term introduced by Faraday, the discoverer of the property, to denote the relative powers or capacities of insulating media, called by him dielectrics, for transmitting electrostatic inductive influence. When an electrified body is brought near to a non-electrified conductor, an electric disturbance takes place at the surface of the latter, electricity of the kind opposite to that which the charged body possesses being attracted and the opposite kind being repelled. This disturbance is said to be due to *induction*. (See INDUCTION, ELECTROSTATIC.) Faraday discovered that it depends for intensity on the nature of the insulating medium between the two bodies, showing that, other things remaining the same, the disturbance is greater with some media than with others. The view that Faraday took of induction was altogether opposed to that which was held previous to the time of his investigations, and which was expressed by speaking of induction as action of electricity at a distance: and by experiments on liquid insulators, and in other ways, he proved that what was looked on as influence at a distance is really an influence transmitted by means of the intermediate particles of the insulating substance. The medium he termed the *dielectric*. He showed that the particles of the dielectric are in a polarized condition when it is exposed to electric force. (For a full exposition of Faraday's theory of induction see INDUCTION, ELECTROSTATIC.)

In order to compare the inductive capacities of various substances, Faraday made use of the fact that the capacity for electricity of a Leyden jar depends on the inductive capacity of the insulator which separates the interior and exterior coatings. He constructed two spherical Leyden jars precisely similar, so far as the conductors were concerned, but arranged so that the insulating medium might be varied. Having charged one of the jars he connected the other to it, the inside coatings together and likewise the outside coatings. Part of the electricity in the charged jar under these circumstances passes into the uncharged jar; and the jars being identical in form, it is divided between the two jars in proportion to the inductive capacities of their respective insulators. By determining the quantity in each jar the inductive capacities of the insulators are compared.

Faraday found that all the gases he experimented on have the same inductive capacity. He took common air as the standard of reference, and found the following numbers to represent the specific inductive capacities of the various substances compared with it:

Air	1.00	Wax	1.86
Spermaceiti	1.45	Glass	1.90
Resin	1.76	Shell-lac	2.00
Pitch	1.80	Sulphur	2.24

Later investigations on specific inductive capacity have been made with a "platimeter," devised by Sir William Thomson (Lord Kelvin), and are far more accurate than any that could be made with Faraday's apparatus.

Capa'neus, one of seven legendary heroes who warred against Thebes, killed by Jupiter.

Cap-à-pie, kăp-ă-pē (O. Fr. *de cap à pic*; Mod. Fr. *de pied en cap*), a term signifying from head to foot, and used with reference to a complete suit of armor covering the body of a knight at all points; as, "He was armed cap-à-pie for the encounter."

Cape Ann, Mass., the southeast point of the town of Gloucester, Mass., the northern limit of Massachusetts Bay; in lat. 42° 38' N., and lon. 70° 34' W. The whole of the rocky peninsula forming this part of Gloucester is also called Cape Ann, including the village of Squam in its northeastern part. This peninsula is a headland of sienite, which forms low hills, over the surface of which the rock is very generally exposed to view. Valuable quarries of sienite for building purposes are worked most conveniently for shipment. The place is much exposed to the prevalent northeast storms; but it offers a small, well-sheltered harbor among the rocks, where coasting vessels often take refuge. There are on the shores of this harbor two fixed lights.

Cape Ann Settlement, the first within the limits of the Massachusetts Bay territory. In 1622, the New England Company, to push the settlement of its grant and give it some value, divided the land in severalty among its members. The region about Cape Ann fell to Edmund, Lord Sheffield, who sold a patent for it in 1624 to Robert Cushman and Edward Winslow of the Plymouth colony. They found some English hunters and fishers who had been there since the year before; these acknowledged the rights of the Plymouth people, and the two parties planted and fished amicably; but shortly after a London vessel which had taken up the quarrel of the firebrand, Rev. John Lyford, seized the Plymouth men's fishing stage. Miles Standish came up from Plymouth to settle the trouble by force, but against his wish, the settlement compromised the matter by the crew agreeing to build them another stage. In 1624 Winslow's company sold the site of Gloucester to the "Dorchester Adventurers," an unincorporated English joint-stock company recently formed. These had anticipated the bargain by sending out a band of settlers the fall before, with live stock, implements, etc., and they made Thomas Gardner overseer. The attempt was unsuccessful, and in 1625 the Dorchester company engaged Roger Conant, then at Nantasket with Lyford, to be governor, Lyford to be minister. But the next year the "Adventurers" dissolved, and most of the settlers went home; the few remaining ones removed to "Nahumkeike" (Naumkeag), and founded Salem.

Cape Ar'ago, a cape on the western coast of Oregon, on the south of Coos Bay. Its lighthouse, which is on a small island, is in lat. 43° 20' 38" N., and lon. 124° 22' 11" W., and shows a white, flashing light.

Cape Bab-el-Mandeb. See BAB-EL-MANDEB.

Cape or Point Barrow. See BARRROW, CAPE OR POINT.

Cape Blanco, Africa. See BLANCO, CAPE.

Cape Blanco, Oregon, a cape forming the most western point of the State, situated in lat. 42° 50' N., and lon. 124° 32' W. It has a lighthouse with a white fixed light, 256 feet above sea-level.

CAPE BOEO—CAPE COLONY

Cape Boeo, bō-ā'ō, the ancient *Lilybaeum Promontorium*, a cape, on the western coast of Sicily, one mile from Marsala. It is the point of Sicily nearest to ancient Carthage, and at an early period became an important naval station. The naval victory of the Romans over the Carthaginians, which put an end to the first Punic war, was gained near this point.

Cape Bojador, bōj-ā-dōr'. See **BOJADOR**, CAPE.

Cape Bon, or **Ras Adder**, a headland of Tunis, on the Mediterranean, forming the northernmost point of Africa, in lat. $37^{\circ} 6' N.$, and lon. $11^{\circ} 3' E.$

Cape Breton, bret'ūn, Canada, an island of the Dominion of Canada, separated from Nova Scotia, to which province it belongs, by the narrow Gut or Strait of Canso; area 3,120 square miles; length about 110 miles. It is of very irregular shape, the Bras d'Or, an almost landlocked arm of the sea (with most picturesque scenery), penetrating its interior in various directions, and dividing it into two peninsulas connected by an isthmus, across which a canal has been cut. The surface is rather rugged, and only small portions are suited for agriculture; but it possesses much timber, valuable minerals (several coal mines being worked), and the coast abounds in fish. Timber, fish, and coal are exported. The island belonged to France from 1632 to 1763, and Louisbourg, its capital, was long an important military post. It was separate from Nova Scotia between 1784 and 1820. The chief towns are Sydney and Arichat. Pop. (1901) 97,190.

Cape Canav'eral, a cape on the eastern coast of Florida, in lat. $28^{\circ} 27' N.$, and lon. $80^{\circ} 33' W.$ There are dangerous shoals at this point, and navigation is protected by a revolving light.

Cape Canso, the eastern extremity of Nova Scotia, at the entrance of Chedabucto Bay, in lat. $45^{\circ} 19.5' N.$, and lon. $60^{\circ} 55' W.$

Cape Car'thage, a headland on the northeast coast of Tunis, jutting out into the Mediterranean. Traces of the ancient city of Carthage are found on it to the north of the Tunis lagoon.

Cape Catoche, kā-tō'chā, a headland at the northeastern extremity of the peninsula of Yucatan, Central America, in lat. $21^{\circ} 34' N.$, and lon. $86^{\circ} 57' W.$ It was on this spot that the Spaniards first landed on the American continent.

Cape Charles, a cape at the northern entrance of Chesapeake Bay, forming the southern extremity of Northampton County, Va., in lat. $37^{\circ} 07' N.$, and lon. $75^{\circ} 53' W.$ Northeast of it, on Smith's Island, is a lighthouse with a revolving light.

Cape Clarence, a headland at the northern extremity of Jones' Sound, Baffin Bay. It is surrounded by inaccessible mountains whose summits are covered with perpetual snow.

Cape Clear, a headland forming the southernmost extremity of Ireland, in lat. $51^{\circ} 26' N.$, and lon. $9^{\circ} 29' W.$ It is on an island of 1,506 acres, with a lighthouse on an abrupt cliff 455 feet high.

Cape Coast Castle, a town and fort of western Africa on the Gulf of Guinea, in the British colony of the Gold Coast, in lat. $5^{\circ} 5' N.$, and lon. $1^{\circ} 13' W.$ The place lies in a chasm, and is defended by the great castle near the water's edge, and by three small forts on the hills behind, one of which serves as a lighthouse and signal station. With the exception of a few houses for Europeans, the town consists of straggling lines of mud huts, with clusters of palm-trees and an occasional tamarind attached. It is a principal mart for native trade. It is connected by telegraph with Accra (the capital), and by road with Prahsue. The climate is unhealthy; mean temperature, 78° . The principal exports are gold-dust, ivory, and palm-oil. Cape Coast Castle was ceded by the Dutch to the English in 1665, and from 1672 was possessed by several British African companies till 1843, when it was taken over by the British government. Pop. about 12,000.

Cape Cod, a cape and peninsula on the coast of Massachusetts, on the south side of Massachusetts Bay, forming the county of Barnstable; lat. of the cape, $42^{\circ} 3' N.$, lon. $70^{\circ} 15' W.$ The peninsula is 65 miles in length and from 1 to 20 in breadth, and is in the form of a man's arm, bent inward both at the elbow and the wrist. Though mostly sandy and barren, it is nevertheless populous; and the inhabitants derive their subsistence chiefly from the sea. The best harbor on the peninsula is at Provincetown. There is a lighthouse known as the Highland Light, on the northeast shore and one at Race Point almost directly west of the former. The navigation around the cape is peculiarly baffling, and hazardous, and the saving to commerce and human life which would result from a short-cut waterway would be great. A proposition to cut a canal from Buzzard's Bay to Barnstable Bay dates from the early part of the 17th century, but nothing was actually done until 1878, when a charter was granted by the legislature of Massachusetts, a company was formed, and work begun. The cape was discovered 15 May 1602 by Bartholomew Gosnold, who gave it its name from having taken a great quantity of codfish near it. In 1620 the Pilgrims of the Mayflower made a temporary landing at the site now occupied by Provincetown.

Cape Cod, a book of travel and description by Henry D. Thoreau, published in 1865. Until Thoreau arrived to make acquaintance with its hard yet fascinating personality, Cape Cod remained unknown and almost unseen, though often visited and written about by tourists and students of nature. Something in the asceticism, or the directness, or the amazing keenness of Thoreau's mind brought him into sympathetic understanding of the thing he saw, and he interpreted the level stretches of shore with absolute fidelity. In this, as in his other books, Thoreau rises from the observation of the most familiar and commonplace facts, the comparison of the driest bones of observed data, to the loftiest spiritual speculation, the most poetic interpretation of nature.

Cape Colon'na. See **SUNIUM**.

Cape Colony, a British colony at the southern extremity of Africa, washed on the west, south, and east by the ocean, and having on the north and northeast, the German terri-

CAPE COLONY

tory of Great Namaqualand, the British territory of Bechuanaland, the Orange River Colony, Basutoland (British), and the colony of Natal. A considerable portion of the boundary on the north is formed by the Orange River. The colony extends about 450 miles from north to south, and 600 from east to west; the coast line is about 1,300 miles. The area is 276,000 square miles. The principal indentations of the coast are St. Helena, Saldanha, Table, False, Walker, Mossel, Plettenberg, St. Francis, and Algoa bays.

In the interior almost every variety of soil and surface is found, but a great part of the colony is arid and uninviting in appearance. Several ranges of mountains, running nearly parallel to the southern coast, divide the country into successive terraces, rising as they recede into the interior, between which lie belts of fertile land, or vast treeless and barren-looking plains. One of these, called the Great Karoo, is 300 miles long and 100 broad, and presents a desolate appearance, having a dry and often baked soil, with small shrubby plants scattered over it. Yet these plains make valuable sheep-walks, the flocks thriving exceedingly well upon the scanty vegetation; and the soil, where water can be obtained by collecting the rain, is generally very fertile. Large reservoirs have been constructed in many places, and permanent homesteads established where formerly flocks could only be maintained for a month or six weeks at a time. The principal and farthest inland mountain terrace averages 6,000 or 7,000 feet in height, and, commencing in Namaqualand, runs eastward under the names of Roggeveld, Nieuwveld, Sneeuwbergen, Stormbergen, etc., to the northeast frontier. The culminating point is the Compass Berg, over 8,000 feet high. The Table Mountain at Cape Town is a stupendous mass of naked rock, rising almost perpendicularly, about 3,585 feet in height. The colony is deficient in rivers, though in this respect the eastern half is more favored than the western. The Orange River is the largest in this part of Africa, but is of little or no use for navigation. Others are the Elephants or Olifants River, flowing into the Atlantic; the Gauritz, Gamtoos, Great Fish, Sunday, and Great Kei, emptying themselves into the sea on the south and southeast.

The most valuable mineral product is diamonds; copper ore is largely exported; coal is mined, and iron ore, gold, amethysts, agates, etc., are found. The bulk of the diamonds that come into the markets of the world in the rough state are now obtained from Cape Colony. The great mining centre is Kimberley, in the far north of the colony, about 10 miles from the Vaal River, and near the frontier of the Orange River Colony. So far as is known, the first of the South African diamonds was casually picked up in 1867, and soon after several others were found, including a fine large stone known as the "Star of South Africa." By the early part of 1870 so many diamonds had been found that a rush of people to the diamond district began to take place, and the banks of the Vaal were soon covered with thousands of diggers. At first the precious stones were found on or near the surface, but subsequently it was discovered that they were to be found deeper down, and latterly they have been obtained many hundreds

of feet below the surface, great open excavations having been made at the localities where they are plentiful. The richest mine has been the Kimberley mine, situated in the centre of the town of the same name, which sprang up around it. For the first hundred feet in depth the diamonds were found embedded in a soft, friable, yellowish earth; below that the soil changed to a slaty-blue color, and was of a firmer consistency, and the diggers then thought that the bottom of the mine had been reached. It was soon discovered, however, that the blue ground yielded as many diamonds as the yellow, if not more, and this productivity has still continued. Another famous mine is the De Beers mine. Both these mines have yielded a remarkable number of large stones, but a great many of the diamonds have been "off-color," that is, yellow, spotted, or otherwise defective in water or lustre. One of the finest yet found in South Africa is the "Porter Rhodes," a beautiful stone weighing 150 carats, and valued at \$300,000. One much larger, a yellow stone, weighing 302 carats, was found in 1884, and a still larger, weighing 428½ carats, was found in the De Beers mine in 1888. The largest in the world, weighing 971 carats, but with a large flaw, was found in the Orange Free State in 1893. Although mining operations have been carried on at great expense, owing to the depths to which the workings have been sunk (some 600 feet or more), the profits of the companies which latterly have owned the mines have been enormous. The rough work has been done almost entirely by the native Africans, of whom 10,000 or 11,000 have been in employment in the mines at one time. Very stringent regulations have had to be enforced to prevent theft of the precious stones, and also illicit dealing in stones unlawfully acquired.

The climate is very healthy and generally pleasant, though in summer the heat is great in some parts. The mean temperature for the year at Cape Town is about 62°. The climate of the dry and elevated inland districts is considered remarkably suitable for persons of consumptive tendency, and many have been attracted to the colony on this account.

Except along the coast line, especially the southeast coast district, where there are extensive forests, timber is scarce. There are upward of a hundred different kinds of woods, however; many of them extensively employed for such purposes as house-building, wagon-making, and furniture- and cabinet-work. With irrigation, trees can be grown anywhere. The aloe and the myrtle attain a great size.

The quadrupeds of the colony comprise the African elephant, still found in the forests of the south coast region; the buffalo, equally restricted in locality; the leopard, jackal, hyæna, numerous antelopes, baboon, aardvark, etc. Lions, at one time numerous, are not now to be met with in the colony, nor is the giraffe. The birds include vultures, eagles, and other *Raptors* (the most remarkable of which is the serpent-eater), pelicans, flamingoes, and most important of all, the ostrich, now bred as a domestic animal for the sake of its feathers, those plucked from an adult bird in a season being sometimes worth from \$50 to \$90. Other native animals are large snakes, the venomous cobra di capello, and the scorpion. Along the

CAPE COLONY

coast whales and seals abound, and salt- and fresh-water fish are plentiful.

The colony is better adapted for pasturage than for agriculture, but wheat, maize, and other cereals can be grown almost everywhere, the only drawback to their cultivation being the want of moisture in certain localities and in certain seasons. In some years a surplus of grain is left for exportation; in others grain has to be imported. All kinds of European vegetables and pot-herbs, and all the fruits of temperate climates, such as apples, pears, plums, peaches, melons, apricots, walnuts, almonds, oranges, limes, etc., thrive excellently, and fruits, dried and preserved, are exported. The vine is cultivated, and some excellent wines (notably those of Constantia) are made. The colony is said to be particularly well suited for grape-culture, and the vines produce heavier crops than are known almost anywhere else. Viticulture, it is believed, is yet only in its infancy, though there are already over 90,000,000 vine-stocks. The colonial government has up to 1899 disposed of 128,000,000 acres of land, the quantity remaining undisposed of being 49,564,000 acres.

Sheep-raising is the most important industry, and wool the chief export (although surpassed in value by diamonds). The amount of this article exported to the United Kingdom in 1899 was 84,032,536 pounds. Most attention is now devoted to the breeding of pure merinoes, the consequence being a great improvement in the wool. Goats are also bred, both the native and the Angora, and the export of goats' wool or hair to Great Britain has increased from 102,570 pounds in 1868 to 12,948,574 pounds in 1899. Cattle-breeding is carried on to some extent, especially along the coasts and in the eastern and northern districts.

There are no manufactures of any importance, and consequently the imports of the colony consist largely of manufactured goods, chiefly from Great Britain. The total imports in 1898-9 were of the value of \$83,652,000; in 1871 their value was \$15,173,014; exports in 1898-9 amounted to \$131,265,250, in 1871 to \$16,422,083. The value of the gold exported in the year 1898-9 was \$83,735,250; of diamonds, including those sent through the postoffice, \$22,145,100. The total value of the diamonds exported from 1867 to 1898 was \$226,800,000. The other exports of importance, besides wool, are ostrich feathers, copper ore, skins, and hides. The exports of merchandise to Great Britain in 1899 amounted to \$45,274,887, the imports of British produce to \$40,645,654. To facilitate the inland traffic numerous roads have been made (the total length within the colony proper amounting to 8,000 miles), while 2,700 miles of railway and 7,500 miles of telegraph have been opened. Light-houses have been built round the coast, and harbor works constructed.

The coinage is that of Great Britain, as are also the weights and measures, except that for land the *morgen* = 2.116 acres is employed.

The constitution formed under the acts of 1853, 1865, and 1872 vests the executive in the governor (who is also commander-in-chief of the forces) and an executive council or ministry composed of certain office-holders appointed by the Crown. The legislative power is in the hands of a legislative council of 23 members, elected for seven years, over which the chief

justice presides *ex officio*, and a House of Assembly of 95 members, elected for five years, representing the country districts and towns of the colony. The public revenue for 1897-8 was \$34,979,292; the expenditure, \$40,891,280; the public debt amounts to about \$145,500,000. The revenue is chiefly derived from railways, customs duties, and taxes. Much the greater portion of the debt represents money spent on the construction of railways.

The European population consists in part of English, Scottish, and Irish settlers and their descendants, but the majority is of Dutch origin (see BOERS), with a considerable number of German origin. The colored people are chiefly Hottentots, Kaffirs, Bechuanas, Basutos, Griquas, Malays, and a mixed race, the off-spring of black women and white fathers. The laborers are chiefly Hottentots and Kaffirs. The prejudices and ill feeling once subsisting between the different nationalities of which the population is made up are now fast disappearing. Education is advancing, though it is not compulsory. The returns show a steady increase in the numbers of children of all classes receiving instruction. For the higher education there are seven colleges, besides a university (at Cape Town) incorporated in 1873. The colleges have each a staff of instructors in classics, mathematics, science, etc., but the university is merely an examining and degree-conferring institution. The religious bodies in the colony with the greatest number of adherents are the Dutch Reformed Church, the Church of England, the Methodists, Independents, and Presbyterians, in the order here given. There is no Established Church.

The chief towns of the colony ranking after Cape Town are Port Elizabeth, Kimberley, and Graham's Town (qq.v.).

The Dutch, who had early fixed upon the Cape as a watering-place for their ships, first colonized it under Van Riebeeck in 1652. Reducing the Hottentot inhabitants to slavery, or driving them beyond the mountains, they extended the Cape settlement over a pretty large area. But the colony was under the rule of the Dutch East India Company, and owing to their regulations, made very slow progress. It was captured by the British in 1795, restored at the Peace of Amiens (1802), and again taken in 1806, Sir David Baird being sent at the head of an expedition to take possession of it, and so prevent it from falling into the hands of the French. From this time it has remained in the possession of the British, to which it was formally assigned in 1815, along with Dutch Guiana, Holland receiving in return £6,000,000. It now began to advance in prosperity, but the progress of the colony was greatly retarded by the Kaffir wars of 1834, 1846, and 1851-3, the result of the depredations of this warlike race. Subsequently the area of the colony was gradually enlarged by the annexation of surrounding districts. The most important of these annexations were British Kaffraria (annexed 1866); Griqualand West (1876); Kaffraria proper, or the Transkeian districts (Transkei proper, Griqualand East, and Tembuland), including nearly the whole of the region between the Kei and the Natal border (1875-80); Pondoland (1894); and part of Bechuanaland (1895). Its most recent history has been connected with the war between Great Britain and the Boer republics. See BOERS; SOUTH AFRICAN WAR.

CAPE COMORIN — CAPE OF GOOD HOPE

Cape Comorin, kōm'ō-rin, the most southern extremity of the peninsula of Deccan, British India, in lat. 8° 5' N., and lon. 77° 30' E., forming a circular, low, sandy point, which is not discernible above the distance of 12 to 16 miles from the deck of a large ship. Eighteen miles north from the cape is a bold summit called Comorin Peak, the southern termination of the western Ghauts, which has, from a distance, been often taken for the cape itself. Within a short distance of the cape lies a rocky islet, high above water; and about three miles from this islet are a fort and a village, a few fishermen's houses, a church, and some ancient temples, being the remains of the once famous town of Cape Comorin.

Cape Diamond, the extremity of an abrupt promontory in the province of Quebec, Canada, at the junction of the St. Charles and St. Lawrence rivers. On the promontory stands the citadel of Quebec, and on the west and nearly on a level with the ramparts lie the Plains of Abraham. Here was gained in 1755 the memorable victory by the English under Wolfe, over the French under Montcalm.

Cape Disappointment, or **Cape Hancock**, a cape at the mouth of the Columbia River, forming the southwest point of the State of Washington, in lat. 46° 16' N., and lon. 124° 2' W. There is a lighthouse at this point with a fixed light.

Cape Ducato, doo-ka'tō, the southern extremity of Santa Maura, one of the Ionian islands. It is identical with the ancient promontory of Leucadia, commonly called the Lover's Leap, or Sappho's Leap. The famous Greek poetess, according to an ancient tradition, threw herself from the top of this promontory.

Cape Elizabeth, a headland projecting into Casco Bay, between Portland harbor in Maine and the Atlantic Ocean, in lat. 43° 33' N., and lon. 70° 11' W. The coast is rocky, made up of ledges of talcose slate, traversed by dikes of trap. There are two lighthouses on the outer point, which stand 300 yards apart, the lights being 140 feet above the sea.

Cape Espichel (probably the ancient *Barbarium Promontorium*), a cape on the western coast of Portugal, 121 miles southwest of Lisbon. It rises abruptly from the sea, and is crowned by a small chapel and a lighthouse.

Cape Farewell, the southern extremity of Greenland, at the eastern entrance to Davis Strait. A strong current sets around this cape, and continues north along the eastern coast of the strait.

Cape Faro, fā'rō, the northeast extremity of the island of Sicily, known to the ancients as *Pelorus*. It is at the narrowest part of the strait of Messina, opposite the rock of Scylla on the coast of Italy.

Cape Fear, the south point of Smith's Island, near the mouth of Cape Fear River, N. C. About one mile from the shore stands Bald Head lighthouse.

Cape Fear River, a river of North Carolina; navigable for steamboats for 120 miles from its mouth. Its length, including one of the head branches, is about 300 miles. Formed by the junction of the Deep and Haw rivers, its course is generally southeast till it reaches the

Atlantic Ocean. This is the largest and most important river which lies wholly within the State.

Cape Finistere, fin-īs-tār', the westernmost point of Spain, in the province of Corunna, extending southwest into the Atlantic, in lat. 42° 54' N., and lon. 90° 21' W. Several naval battles were fought off this cape.

Cape Flattery, the most westerly point of the State of Washington, at the entrance to the Strait of Juan de Fuca, in lat. 48° 23' N., and lon. 124° 44' W. On the island of Tatoosh, opposite the cape, there is a lighthouse.

Cape Florida, the southern extremity of Biscayne Key off the southeast coast of Florida, at the north entrance to Biscayne Bay, in lat. 25° 39' N., and lon. 80° 9' W. There is a lighthouse on the shoals opposite this point.

Cape Foulweather, a cape projecting into the Pacific Ocean from the coast of Oregon, in lat. 44° 50' N., and lon. 124° 5' W.

Cape Fox, or **Lalande's Dog**, a peculiar canine animal (*Otocyon lalandi*), differing from other dogs principally in the possession of an additional molar in each jaw. Other characters in the structure of the jaw and dentition suggest that *Otocyon* is a persistent creodont-like form, which has developed from a primitive arctoid stock in a direction curiously parallel to that of the true dogs. No other mammal outside the marsupial order ever has four molar teeth in both jaws, and this may indicate a still more remote marsupial ancestry. This wild dog is generally found in open country, dwelling among small bushes in pairs, exceedingly shy, and not gathering into packs. It is rather smaller than a fox and resembles a fennec in having enormous ears and a thick, bushy tail. In general color it is brownish or iron gray, mottled with yellow and with the limbs nearly black.

Cape Frio, frē'ō (Port. *Cabo Frio*, "cool cape"), a promontory on the coast of Brazil, in the State of Rio de Janeiro. It forms the terminus of a range of mountains running parallel to the coast, and consists of a huge oval mass of granite. There is a lighthouse at this point.

Cape Froward, the southern extremity of the continent of South America, lying northwest of Cape Horn, in lat. 53° 53' S., and lon. 71° 18' W. It is a bold promontory of dark slaty rock.

Cape Gaspé. See GASPÉ.

Cape Gata, gā'ta, or **Cape de Gatte**, a promontory of Spain, on the coast of Granada, 24 miles in circuit and 13 miles broad. It was formerly a resort of Moorish pirates.

Cape Girardeau, jē-rār-do', Mo., a city of Cape Girardeau County; on the Mississippi River, the Illinois Cent., and the St. Louis, C. G. & F. S. R.R.'s; 150 miles southeast of St. Louis. It is the seat of St. Vincent's College and the Southeastern Missouri State Normal School, and has a national bank and several newspapers. Pop. (1900) 4,815.

Cape of Good Hope, a promontory near the south extremity of Africa, in lat. 34° 21' S., and lon. 18° 3' E., at the termination of a small peninsula extending south from Table Mountain, which overlooks Cape Town. This penin-

CAPE GRISNEZ—CAPE NOME

sula forms the western side of False Bay, and on its inner coast is Simon's Bay and Simon's Town, where there is a safe anchorage and a British naval station. Bartholomew Diaz, who discovered the Cape in 1487, called it Cape of Storms; but John II. of Portugal changed this to its present designation. It was first doubled by Vasco de Gama in 1497. Here is one of the principal astronomical institutions of the world. About the middle of the 16th century the French astronomer, Lacaille, made an exceedingly valuable series of observations at the Cape. Ever since the English have had a colony there they have kept up astronomical work, the Cape having been the scene of the labors of several celebrated English astronomers, among them Sir John Herschel.

Cape Grisnez, grē-nā, a headland of France in the department of Pas-de-Calais, the nearest point of the French coast to Great Britain. It has a revolving light 195 feet high.

Cape Guardafui, gwār-dā-foo-ē', or **Gar-dafui**, a cape on the east coast of Africa in Somaliland, situated in lat. 11° 50' N., and lon. 51° 16' E.

Cape Haitien, ā-ē-tē-ān, or **Cape Haytien**, Haiti, a town on the north coast of the island. It was formerly known as Cap Français, Le Cap, or Guarico, the latter being the native name. It has an excellent harbor, but has declined in importance in recent years. Pop. about 29,000.

Cape Hat'teras, the easternmost point of North Carolina, a sandy insular spit, or narrow beach, separated from the mainland by the broad bay called Pamlico Sound. South of the capes of the Delaware, no land stretches so far out into the Atlantic as Cape Hatteras. The Gulf Stream, in its eastern and western vibrations, often flows within 20 miles of the cape, crowding toward the shore coasting vessels bound south. The difference of temperature between the hot airs of the Gulf and the breezes along shore and from the land engender frequent commotions in the atmosphere at this place; and no point on the coast is more noted for its frequent and dangerous storms. A lighthouse is kept a little over a mile north of the outermost point.

Cape Henlo'pen, a cape on the eastern coast of Delaware at the south side of the entrance to Delaware Bay, in lat. 38° 47' N., and lon. 75° 5' W.

Cape Henry, a cape on the coast of Virginia at the southern entrance of Chesapeake Bay. It has a fixed light 120 feet above the level of the sea.

Cape Horn, the southern extremity of an island of the same name, forming the most southerly point of South America. It is a precipitous headland, 500 to 600 feet high, and running far into the sea. Sailing vessels often encounter dangerous tempests in passing round the Horn; steamers generally pass through the Straits of Magellan. The cape was first doubled in 1616 by the navigator Schouten, a native of Hoorn, Holland, whence its name.

Cape Hunting-dog, a wild dog of Africa (*Lycan pictus*), which is placed in a separate genus because it differs from all other dogs in having only four toes on each limb, in lacking one pair of molars in the upper jaw, and in certain other features. It resembles a hyæna in

form, and is yellowish-gray, with irregular, black markings. It hunts in packs, and is one of the enemies most dreaded by all the African antelopes. Since the decrease of this, its natural game, it has played havoc with domestic cattle and sheep, and is killed off by the settlers wherever found.

Cape Island. See CAPE MAY, N. J.

Cape de la Hague, hāg (written also, but less correctly La Hogue), a headland of Normandy, France, opposite the island of Alderney, and forming the northwestern extremity of the peninsula of Cotentin, in the English channel. It is often confounded with Fort La Hogue or La Hougue, on the opposite side of Cotentin. Near this latter promontory the united English and Dutch fleets defeated the French, 19-24 May 1692.

Cape Linguetta, līn-gwēt'ta, a headland of European Turkey, 2,200 feet high. It forms the termination of the Chimara, or Acroceraunian Mountains, and bounds the east entrance into the Adriatic.

Cape Lookout, a cape situated on an island off the southeast coast of North Carolina, in lat. 34° 37' N., and lon. 76° 31' W. There is a lighthouse at a considerable height above the sea.

Cape Lopa'tha, the southern extremity of Kamchatka. At the northern part of the headland is a mountain, bearing the same name, whence the land gradually slopes and narrows until it terminates in a low and barren tongue.

Cape Lopez, lō'pāth, the southern extremity of the Bight of Biafra, on the west coast of Africa. It is situated in lat. 0° 36' S., and lon. 8° 44' E.

Cape Matapan, mā-ta-pān', a promontory of Greece, forming the southern extremity of the Peloponnesus, in lat. 36° 23' N., and lon. 22° 20' E. The name *Tanarum*, or *Promontorium Tanarium*, was applied by the Greeks to the headland, and to the small peninsula north of it, connected with the great Taygetic peninsula by a narrow isthmus.

Cape May, N. J., a city and watering place in the southern part of Cape May County, having good railroad and water communication. It has a fine beach and is very popular as a seaside resort, providing accommodations in hotels and boarding-houses for guests 10 times exceeding in number the permanent inhabitants. The place is sometimes called Cape City or Cape Island City. Pop. (1900) 2,257.

Cape May, the southern extremity of New Jersey, at the entrance to Delaware Bay, situated in Cape May County, in lat. 38° 56' N., and lon. 74° 57' W. It has a revolving light about 150 feet above sea-level.

Cape Mendocino, mēn-dō-sē'no, the westernmost point of the coast of California, projecting into the Pacific Ocean in lat. 40° 26' N., and lon. 124° 25' W. It has a very high lighthouse with a flashing light.

Cape Ned'dock, Maine, a promontory 35 miles southwest of Portland, with a lighthouse on Goat Island near it, containing a fixed light, 33 feet above the sea.

Cape Nome, nōm, a cape on the south coast of the peninsular projection of Alaska, which separates Kotzebue Sound on the north

CAPE NORTH — CAPE TOWN

from Bering Sea on the south, and terminates on the west in Cape Prince of Wales. In the vicinity of the cape is a remarkably rich gold mining region. In a direct line of navigation, it lies about 2,500 miles northwest of Seattle, and 175 miles southeast of Siberia. The nearest settlement of consequence, prior to 1899, was St. Michael, 100 miles to the southeast, the starting point of the steamers for the Yukon River; but during the year various aggregations of mining population had built themselves up in closer range and reduced the isolation from the civilized world by some 60 miles. The Nome district as settled centres about the lower course of the Snake River, an exceedingly tortuous stream in its tundra course, which emerges from a badly degraded line of limestone, slaty, and schistose mountain spurs, generally not over 700 to 1,200 feet elevation, but backed by loftier granitic heights, and discharges into the sea at a position 13 miles west of Cape Nome proper.

The first discovery of gold was made in September 1898, when a party of Swedes found it on the creeks and the gulches. It was not until July 1899 that the beach gold was discovered. In the middle of October following, Nome City had 5,000 inhabitants all living in tents on the hitherto barren shore. The rapidity of the growth of this town has probably never been equaled. The region is wholly within American territory, and early prospecting indicated that it would rival in richness the famous Klondike district. During the season of 1901 \$7,000,000 in gold was taken from the Cape Nome region.

Cape North, the northeast point of Cape Breton, projecting into the Gulf of St. Lawrence.

Cape North, or **Otoo, Otou**, a peninsula at the northern extremity of New Zealand, about two miles long, and terminating in a bluff head flat at the top.

Cape North, northernmost promontory of Europe. See **NORTH CAPE**.

Cape Nun, noon, a headland on the west coast of Morocco, extending into the sea at the southwestern extremity of the Atlas range, in lat. $28^{\circ} 45' N.$, and lon. $11^{\circ} 5' W.$

Cape Ortegal, ör-tä-gäl', a rugged promontory forming the northern extremity of Spain, extending into the Bay of Biscay, in lat. $43^{\circ} 45' N.$, and lon. $7^{\circ} 56' W.$

Cape Pal'mas, a cape on the western coast of Africa, situated in the southern part of Liberia, in lat. $4^{\circ} 22' N.$, and lon. $7^{\circ} 44' W.$

Cape Petrel, or **Cape Pigeon**, a large petrel (*Daption capensis*), about the size of a pigeon, exceedingly numerous about the Cape of Good Hope, and widely distributed throughout the Southern Ocean.

Cape Pillar, a high mass of rocks terminating in two tower-shaped cliffs on the northwest coast of Tierra del Fuego, at the southwest entrance from the Pacific Ocean into the Straits of Magellan.

Cape Poge, a cape on the coast of Massachusetts, in lat. $41^{\circ} 25' N.$, and lon. $70^{\circ} 26' W.$ It has a lighthouse with a fixed light.

Cape Prince of Wales, a promontory on Bering Sea, the most northwest point of North America. It terminates in a peaked mountain,

presenting a bold face to the sea, and is a dangerous point on account of a shoal which stretches to the northeast.

Cape Race, a promontory at the southeastern extremity of Newfoundland, in lat. $46^{\circ} 39' N.$, and $53^{\circ} 4' W.$ The fogs of this part of the coast make navigation hazardous. The British government maintains a light here.

Cape River, or **Rio de Segovia**, known also as **Coco** or **Wanx**, a river of Nicaragua, Central America, which after a generally northeast course of nearly 300 miles enters the Caribbean Sea at Cape Gracias a Dios. It is navigable for a considerable distance from the sea, but the upper part of its course is obstructed by cataracts and shallows. It forms part of the boundary between Honduras and Nicaragua.

Cape Romain', a low and barren point of land, with a lighthouse, 37 miles northeast of Charleston, S. C.

Cape Sable, the name of two capes in North America: (1) The southernmost point of the mainland of the United States at the extremity of Florida, in lat. $25^{\circ} 8' N.$, and lon. $81^{\circ} 9' W.$ (2) A point at the southwest extremity of Nova Scotia, in lat. $43^{\circ} 23' N.$ and lon. $65^{\circ} 37' W.$

Cape San Antonio, sän än-tō'nē-ō, the name of two capes: (1) A high, barren, and precipitous headland, on the coast of Valencia, Spain. On its summit are a convent, a watch tower, and several windmills. (2) A lofty and nearly perpendicular promontory, at the mouth of the Rio de la Plata, in the territory of Buenos Ayres.

Cape San Blas, sän blä, a low point of land, about two miles long, on the south coast of Florida, 123 miles east-southeast of Pensacola. It has a revolving light 65 feet high.

Cape San Lucas, loo'käs, the southern extremity of the peninsula of Old California, in lat. $22^{\circ} 44' N.$, and lon. $109^{\circ} 54' W.$

Cape St. Roque, rō'kā, **San Roque**, or **São Roque**, a cape on the east coast of Brazil, in lat. $5^{\circ} 29' S.$, and lon. $35^{\circ} 14' W.$ See **BRAZIL**.

Cape St. Vincent, a headland at the southwestern extremity of Portugal, in lat. $37^{\circ} 3' N.$, and lon. $8^{\circ} 58' W.$ Off this cape, 14 Feb. 1797, an English naval force, consisting of 15 ships of the line, under Admiral Jarvis, defeated a superior Spanish fleet. This point was known to the ancients as *Promontorium Sacrum*.

Cape Spartiven'to, the ancient *Herculis Promontorium*, a promontory of southern Italy, forming the southeastern extremity of Calabria, in lat. $37^{\circ} 57' N.$, and lon. $16^{\circ} 5' E.$

Cape of Storms. See **CAPE OF GOOD HOPE**.

Cape Tindaro, tîn-dä'rō, a headland of Sicily, extending into the Gulf of Patti. The remains of the ancient Tyndaris are in its neighborhood.

Cape Town, Africa, capital of the Cape Colony, situated in the midst of striking scenery, rather more than 30 miles from the Cape of Good Hope, at the head of Table Bay, which opens into the Atlantic on the northwest, and at the foot of Table Mountain. It is regularly laid out and has some good streets, with well-

CAPE TRAFALGAR — CAPEL

built business premises and other buildings, and is furnished with most of the institutions and conveniences of a European town (including tramways). The finest edifice is that which accommodates the legislature, a handsome structure of modern erection; another good edifice is that containing the public library (40,000 volumes) and museum, in the Roman-Corinthian style. The Standard Bank of South Africa also occupies handsome premises. Other buildings are the government house, the courts and government offices, the town house, the gallery of fine arts, the railway station, the post-office, the exchange, etc. The best ecclesiastical building is the Roman Catholic Cathedral; there is also an English Episcopal Cathedral, and Dutch, Presbyterian, Lutheran, Independent, and Methodist churches. There is a well-equipped college, the South African College, which trains students for the degrees of the Cape University, which is merely an examining body. There are beautiful botanic or government gardens in the town, occupying 14 acres, and forming a fine promenade. The Cape Observatory is a celebrated institution supported by imperial funds. A railway runs from Cape Town into the interior of the colony, connecting the town with the Orange Free State and Transvaal. The port has been provided with a breakwater 3,554 feet long, inside of which ships can safely ride at anchor protected from the northwest gales; and there are two docks 16 acres in area, an outer harbor of 62 acres, a large graving dock, etc. The population is very mixed, a large number consisting of colored people of negro or other African descent. About 14,000 are Malays, descendants of those who were brought from the Dutch East Indies; they constitute the chief fishing and working population of the town and environs. They number altogether about 86,000, more than half of the whites being of Dutch descent.

Cape Trafalgar, trăf ăl gâr, or tră-făl'gâr, a headland on the coast of Cadiz, Spain. It is memorable for the naval battle fought near it, 21 Oct. 1805, between the English under Nelson, and the combined fleets of France and Spain. The English gained a complete victory, though with the loss of their commander. It was known to the Romans as *Promontorium Junonis*.

Cape Verde, the most westerly headland of Africa in Senegal, jutting out into the Atlantic Ocean, between the rivers Gambia and Senegal, in lat. 14° 43' N., and lon. 17° 30' W. It was discovered by the Portuguese navigator, Fernandez, in 1445, and is said to have derived its name from a group of gigantic baobab trees adorning its summit.

Cape Verde Islands, a group of islands west of Africa, in the Atlantic Ocean, so called from Cape Verde, opposite to which they are situated; 320 miles west of Cape Verde, and between lat. 15° and 18° N. They belong to Portugal. As to their number, some reckon 10, others 14 or more, by giving the name of islands to masses which are only rocks. They are, in general, mountainous. The island of Fogo, one of the group, consists of one single mountain, a volcano, sometimes active, about 10,000 feet above the level of the sea. Some of the islands are very bare; in others the lower hills are covered with a beautiful verdure, as well as the

valleys between; but there is little water, except what is found in ponds and wells. Long droughts have occurred, sometimes causing great loss of life. The climate is hot and unhealthy in most of the islands. The soil is, for the most part, not very fertile; nevertheless, some parts produce sugar, coffee, rice, maize, etc., with bananas, lemons, oranges, citrons, grapes, and other fruits. The total population amounts to about 148,000, of whom about 4,000 are white, the rest being chiefly negroes. The chief town is Porto Praya on São Thiago (Santiago), and Porto Grande on São Vicente is a coaling station for steamers. Salt is an export of importance. Coffee, hides, and physic-nuts are also exported.

Cape Wrath, a pyramidal promontory of unrivaled wildness and grandeur, forming the northwest extremity of Scotland and running out into the Atlantic; in lat. 58° 38' N., and lon. 4° 58' 5" W. It presents deep fissures and tall pinnacles. From it a reef of rocks, perforated with arches and caverns, juts out into the sea. Off the cape is Stag Rock, a pillar 200 feet high. Cape Wrath is 600 feet high, and there is a lighthouse near it, 400 feet above the sea, visible 25 miles off.

Capecelatro, Alphonse, ăl-fônș kă-pă-che-lătrô, CARDINAL, Italian pietist biographer and controversialist: b. Marseilles, 5 Feb. 1824. He has won distinction as Italy's leading contemporary Church writer, with a 'History of St. Catherine of Siena and of the Papacy of Her Day' (1856); 'The Errors of Renan'; a 'Life of Jesus'; and a 'Life of St. Philip of Neri' (1882).

Capefigue, Baptiste Honoré Raymond, bap-têst ô-nô-râ râ-môn kap-fêg, French historian and journalist: b. Marseilles, 1802; d. Paris, 23 Dec. 1872. His contributions to historical science are the 'History of Philip Augustus' (1829); and 'History of the Restoration and of the Causes that Led to the Fall of the Elder Branch of the House of Bourbon' (1831-3).

Cap'el, Arthur, LORD, English soldier: b. about 1610; d. 9 March 1649. He was son of Sir Henry Capel; was raised to the peerage as Lord Capel, of Hadham, by Charles I. in 1641. During the revolutionary war he fought bravely as one of the royalist generals in the west in the engagements at Bristol, Exeter, and Taunton. Having been at length forced to surrender at Colchester to Gen. Fairfax, he was imprisoned, and after some vicissitudes, executed. His 'Daily Observations or Meditations' was published posthumously with a memoir.

Capel, Arthur, VISCOUNT MALDEN and EARL OF ESSEX, English statesman, son of the preceding: b. January 1631; d. July 1683. In 1661 he was created Viscount Malden and Earl of Essex and appointed ambassador to Denmark in 1670. He served as lord-lieutenant of Ireland, 1672-7, and was for a few months in 1679 head of the treasury commission. Arrested for his connection with the Rye House Plot, was sent to the Tower, and is supposed to have committed suicide there.

Capel, Thomas John, MONSIGNOR, English Roman Catholic ecclesiastic: b. London, 28 Oct. 1835. He was educated at the Roman

Catholic College at Layston and was ordained to the priesthood in 1860. He devoted himself to education, establishing a Roman Catholic public school at Kensington in 1873, and was given the title of Monsignore by Pope Pius IX. He came to the United States in 1883, and after a lecture tour settled to private life in California. He is the author of 'The Holy Catholic Church'; 'Confession'; 'The Name Catholic'; 'The Pope the Head of the Church.' As Catesby he is supposed to be portrayed in Disraeli's 'Lothair.'

Ca'pel, or **Ca'ple**, a term used by miners to indicate the wall of a lode, especially in a tin or copper mine. It is generally of quartz, black tourmalin, and hornblende. The capels sometimes contain sufficient metallic particles to make it worth while to work them. In these cases they may be considered as forming part of the lode. The word "cab" is an equivalent used by Cornish miners. In the United States, "casing" is nearly synonymous.

Capeline, or **Capelline**, a small piece of armor, consisting of a skull cap of iron, worn in the Middle Ages by light armed men such as archers.

Cap'ell, **Edward**, English Shakespearean scholar: b. Throston, Suffolk, 1713; d. London, 24 Feb. 1781. He was deputy inspector of plays, and published 'Mr. William Shakespeare, His Comedies, Histories, and Tragedies'; 'Notes and Various Readings of Shakespeare'; and 'The School of Shakespeare.'

Capel'ia, **Martianus Mineus Felix**, Latin writer of the 4th century: b. probably in Africa. His extant work, 'Satiricon,' consists of nine books, the first two under the title, 'De Nuptiis Philologiae et Mercurii,' being an introductory allegory, while the others treat of grammar, logic, metaphysics, geometry, arithmetic, astronomy, and music. His statement of the heliocentric system of astronomy in the eighth book may possibly have given hints to Copernicus, who quotes him occasionally.

Capella, a star situated in the constellation Auriga, on the "Charioteer's" left shoulder. It is of remarkable brilliancy, only four stars exceeding it in that respect. Its color is nearly that of solar light.

Capellini, **Giovanni**, jō-vān'nē kā-pēl-lē'nē, Italian geologist and paleontologist: b. Spezia, 13 Aug. 1833. He studied at Pisa, and traveled widely. In 1860 he became professor at Genoa, and later at Bologna. He has emphasized the importance of prehistoric discoveries which related archaeology to paleontology and defended the Darwinian theory. He was influential in calling the International Congress of Anthropology and Prehistoric Archaeology in 1865.

Capello, **Bianca**, bē-ānk'ā kā-pēl'lō, Italian adventuress: b. Venice, 1542; d. in the Castle Poggio di Capano, 11 Oct. 1587. In 1563 she eloped with a banker's clerk named Pietro Buonaventuri, who put himself under the protection of Francesco de Medici at Florence. The latter made Bianca his mistress and her husband his steward, but had him put to death in 1570, and after the death of his wife, Joanna of Austria, married Bianca in 1578. She and Francesco are supposed to have been poisoned by his brother and successor, Cardinal Fernando.

Capello, **Hermengil'de**, **Augus'to de Brito**, brē'tō, Portuguese African explorer: b. Lisbon, 1839. He entered the navy in 1858, and rose to the rank of captain. In 1877-9 he, with Robert Ivens, conducted an expedition which explored the sources of the Kuanga. In 1885 he set out on a second expedition with Ivens, traveling through the southern part of Africa from Mossamedes to Mozambique, thus exploring the sources of the Congo and the Zambesi, a country almost entirely unknown before. He wrote with Ivens 'De Benguela a serras de Jacca' (1881); and 'De Angola a Contra-Costa' (1886).

Capen, **Elmer Hewitt**, American educator: b. Stoughton, Mass., 5 April 1838. He graduated at Tufts College in 1860, and was elected to the Massachusetts legislature while still an undergraduate, 1859. After studying at the Harvard Law School, he was admitted to the bar, and practised at Stoughton for a short time; began the study of theology, became a Universalist clergyman, held pastorates at Gloucester, Mass., and Providence, R. I., 1865-75, when he was elected president of Tufts College, a position he still holds. His administration has been most successful in every way, and under him the institution has grown to be one of the most progressive of American colleges. A limited edition of his addresses has appeared, entitled 'Occasional Addresses' (1902).

Ca'pen, **Nahum**, American historical writer: b. Canton, Mass., 1804; d. 4 Jan. 1886. He was postmaster of Boston, Mass. (1857-61); introduced street letter-box collections; wrote 'The Republic of the United States'; 'History of Democracy' (1874); etc. He also wrote and edited works on phrenology.

Capen, **Samuel Billings**, American missionary commissioner: b. Boston, Mass., 12 Dec. 1842. He was educated in the public schools, and after leaving the English High School in 1858 entered the carpet store in which he became a partner in 1864. He is best known to the public through his close association with the missionary work of the Congregational Church. He was president of the Boston Municipal League, 1894-9; of the Congregational Sunday School and Publishing Society; and served most effectively as president of the American Board of Commissioners for Foreign Missions.

Capercaillie, kāp-ēr-kā'lī, **Capercaillie**, or **Cailzie**, kā'lī, a readily domesticated, polygamous grouse (*Tetrao urogallus*), about the size of a turkey, widely distributed throughout the pine-covered mountains of Europe. Formerly it inhabited Ireland and Scotland, where it was known as "blackcock," but it was entirely extirpated toward the end of the 18th century. It has since, however, in small numbers, been restored to Scotland by stock imported from Scandinavia. The ground color of the cock is muddy black, spotted with gray and brown; quill feathers dark brown; tail feathers nearly black; a glossy dark green chest; whitish bill and a small patch of naked skin above the eye, which is scarlet. The feet are feathered to the toes. The hen and young are dark brown, covered with freckles of a lighter shade; neck and chest yellowish chestnut, and the feathers of the under part usually edged with white. It

CAPER — CAPET

feeds chiefly upon berries, seeds, insects, and the young shoots of the pine and other trees, which give its flesh a delicate turpentine flavor. They are hunted with the aid of dogs, which "tree" them, when they are easily shot. In the early spring, at the approach of the breeding season, the cocks meet at an accustomed place to give the hens the benefit of their annual "dances," at which assemblies the hens seem to choose their mates by the amount of plumage, color, daring, and extraordinary gestures which each displays. On such occasions the cock is oblivious to all else save the winning of his mate, and may easily be approached and killed. The female bird builds her nest on the ground among the pines, generally laying from 6 to 12 eggs, few of which reach maturity, owing to the carelessness of the mother. They are spotted red or yellowish brown, and are over two inches long. Consult: Lloyd, 'Game Birds of Sweden and Norway'; Morris, 'British Game Birds'; and Darwin, 'Descent of Man.'

Capern, Edward, English minor poet: b. Tiverton, Devonshire, 29 Jan. 1819; d. 1894. He was long in the mail service in his native county, and was often styled "The Postman Poet." The poet Landor, attracted by the verse of Capern, procured him a pension from the civil list. His published works include: 'Poems by the Biddeford Rural Postman'; 'Ballads and Songs'; 'Wayside Warbles'; 'Sun-gleams and Shadow Pearls.' His verse is mainly descriptive of Devon life and character and several of his lyrics were set to music by the poet himself.

Caper'naum, a city of ancient Palestine, on the west or northwest side of the Sea of Tiberias. This place is famous in Christian history, because Jesus often visited it during the time of his ministry, and in its vicinity he delivered the Sermon on the Mount. Nothing of the city now remains.

Capers, Ellison, American Protestant Episcopal bishop: b. Charleston, S. C., 14 Oct. 1837. He graduated at the South Carolina Military Academy 1857, and was a professor there, 1858-60. He entered the Confederate army, was successively major, lieutenant-colonel, and brigadier-general, and received severe wounds at Jackson, Miss., Chickamauga, and Franklin, Tenn. He was secretary of State of South Carolina in 1867-8, then entered the Protestant Episcopal ministry, and was rector of Christ Church, Greenville, S. C., for 20 years, and at Columbia, S. C., for six years. In 1893 he was consecrated seventh bishop of South Carolina.

Capers, the unopened flower-buds of a low shrub (*Capparis spinosa*), which grows from the crevices of rocks and walls, and among rubbish, in the southern parts of France, in Italy, and the Levant. The stems of the caper-bush are trailing, and two or three feet long. In the south of France the caper-bush is very common. It grows wild upon the walls of Rome, Sienna, and Florence, and, when trained against a wall, flourishes even in the neighborhood of Paris. It was introduced into Great Britain as an exotic as early as 1596. Modern horticulturists are of opinion that with care it might be raised in the open air in England, but this has never been accomplished to any practical extent. It is cultivated on a large scale between Marseilles and Toulon and in many parts of Italy. In the early part of summer it be-

gins to flower, and the flowers continue successively to appear until the commencement of winter. The buds are picked every morning before the petals are expanded; and as they are gathered they are put into vinegar and salt. When a sufficient quantity is collected they are distributed, according to their size, into different vessels, again put into vinegar, and then packed up for sale and exportation. The smallest capers are the dearest, simply from the reason that they are more troublesome to gather. This pickle is much used in sauce for boiled mutton. To persons unaccustomed to it the taste of capers is unpleasantly sharp and bitter, but after a little while the palate becomes reconciled to it. The flower-buds of the marsh-marigold (*Callthapalustris*) and the seeds of nasturtiums are frequently pickled and eaten as a substitute for capers. The bark of the root of the caper, cut into slices and dried in small rolls or quills, is sometimes used in medicine as a diuretic and in cases of obstruction of the liver.

Capes, Bernard, English novelist. His works include: 'The Lake of Wine' (1898); 'The Adventures of the Comte de la Muette' (1898); 'Our Lady of Darkness'; 'At a Winter's Fire' (1899); 'From Door to Door' (1900); 'Joan Brotherhood' (1900); 'Love Like a Gipsy' (1901); 'Plots' (1901). The majority of these have been republished in the United States.

Capes, William Wolfe, English historical writer. He has published: 'The Early Roman Empire'; 'Roman Empire in the 2d Century' (1876); 'University Life in Ancient Athens' (1877); 'Livy' (1879); 'Stoicism' (1880); 'History of the Achæan League,' a translation from Polybius (1888); 'The English Church in the 14th and 15th Centuries'; 'Rural Life in Hampshire.'

Capet, *kā-pā*, or *kāp'ā*, the name of the French race of kings, which has given 118 sovereigns to Europe, namely, 36 kings of France, 22 kings of Portugal, 11 of Naples and Sicily, 5 of Spain, 3 of Hungary, 3 emperors of Constantinople, 3 kings of Navarre, 17 dukes of Burgundy, 12 dukes of Brittany, 2 dukes of Lorraine, and 4 dukes of Parma. The history of this royal race is, at the same time, the history of the rise and progress of the French monarchy. The fate of one of the most interesting countries and nations in Europe is connected with the name of Capet. After having been deprived of four thrones, and again restored to them, this family stood forth as the first and most ancient support of the European principle of political legitimacy, that divine right, which in this house commenced with treason. Its origin is remarkable. Pepin the Short, the father of Charlemagne and mayor of the palace under the Merovingian dynasty, had displaced that royal house, and usurped the throne of the ancient kings of the Franks. After a space of 235 years his own descendants, the Carolingian monarchs, experienced a similar fate. Under the last Carolingians, destitute alike of energy and wisdom, Hugh the Great, Duke of France (by which was then understood the Isle of France), Orleans, and Burgundy, exercised a power as unlimited as that of the mayor of the palace under the Merovingians. On the death of Louis V., without children, in 987 his uncle,

Charles, Duke of Lower Lorraine, laid claim to the throne, which the Franks had sworn to preserve to the family of Charlemagne. The French nobility, disgusted at the German leanings of the Carolingians, whose domains and influence lay in the eastern provinces, preferred that a member of their own class, whose possessions were situated in the centre of the country, and whose power was so great as to outrival that of the old dynasty, should rule over them, and accordingly chose as their king Hugh, son of Hugh the Great, Duke of France and Count of Paris, and had the support of the Church in their favor. The valiant Charles of Lorraine was surprised in Laon by the treachery of a bishop, and made prisoner. He died soon afterward in prison, and his son, Otho, Duke of Lower Lorraine, died in 1006. Both his younger brothers died childless in Germany. Thus the race of Capet was left in possession of the throne of France. According to some historians, Hugh Capet was descended from a Saxon family. He was married to a German princess, Adelaide, daughter of King Henry I. of Germany (Duke of Saxony). Hugh was crowned at Rheims, and swore to preserve to the nation, and particularly to the powerful feudal nobility and clergy, all their existing privileges. By his wise measures he gave permanence to his dynasty, which, next to the family of Guelph, is the oldest royal line at present existing. Hugh and the succeeding monarchs, till Louis VII., took the precaution to have their successors invested with the royal title during their own lifetime. Thus Hugh had his son, Robert, crowned and anointed as his colleague as early as 1 Jan. 988. He abolished by law the partition of the hereditary estates among the sons of the kings and forbade the alienation of the family domains. The daughters of the kings were endowed from that time with money, and the appanage which was given to the princes of the blood returned to the crown in default of male heirs. Both these principles were more fully confirmed by later laws. Thus Hugh Capet, by uniting his hereditary duchy, consisting of Paris, Isle de France, and Burgundy, inalienably with the crown, may be regarded as the founder of the French monarchy. What he had begun was completed by his successors, particularly in the times of the Crusades, and by the establishment of standing armies. On the failure of the direct line at the death of Charles IV., the French throne was kept in the family by the accession of the indirect line of Valois, and in 1589 by that of Bourbon. Capet being thus regarded as the family name of the kings of France, Louis XVI. was arraigned before the National Convention under the name of Louis Capet.

Cap'grave, John, English historian: b. Lynn, Norfolk, 1393; d. there, 1464. The most of his life was passed in the Augustinian friary of his native place. He was provincial of the order of Austin Friars in England, and was one of the most learned men of his day. He wrote in Latin numerous commentaries, sermons, and lives of the saints. His most important work was his 'Chronicle of England,' in English, extending from the creation to the year 1417. Other works were a 'Liber de Illustribus Henricis' and a 'Life of St. Katherine.' Many of his works are lost, others have never yet

been printed. His 'Chronicle' and his 'Liber de Illustribus Henricis' have been printed in the Rolls series.

Caphtor, kăf'tôr, the country in which the Philistines originated; mentioned in Deut. ii. 23; Jer. xlvii. 4; and Amos ix. 7. The location of Caphtor is not certain; it has been variously identified with Cappadocia, Cyprus, Crete, and Cilicia. It is most generally supposed to have been Crete, on account of the frequent connection of the Philistines with the Cherethites (or Cretans).

Capias, kăp'ē-ās ("that you take"), a writ or process whereby the sheriff is ordered to arrest the body of the defendant. The writ so framed as to call for the arrest of the defendant before judgment, in order to compel him to answer to a suit, is called a *capias ad respondendum*; if after the judgment, to compel him to satisfy the judgment, it is called a *capias ad satisfaciendum*, commonly abbreviated *ca. sa.* In case of injuries without force, the civil law, and originally the common law, did not authorize the arrest of the defendant before judgment, that is, the arrest to answer; and upon feudal principles, says Sir William Blackstone (3 Com. 281), "the person of a feudatory was not liable to be attached for injuries merely civil, lest thereby the lord should be deprived of his services." The first writ of *capias ad respondendum* was given by act of Parliament in 1267, 52 Hen. III. c. 23, § 1, which provided that "if bailiffs, which ought to make account to their lords, do withdraw themselves, and have no lands nor tenements whereby they may be distrained, they shall be attached by their bodies, so that the sheriff shall cause them to come to make their account." This act applied to a particular description of receivers, and supposed them not only to be debtors, but also to have in their own hands the evidence of the amount of the debt, the production of which was one object of the process. The statute of 13 Edw. I., c. 11, passed in 1285, 18 years after the former, extends this process to "all manner of receivers bound to yield account," and provides "if they be found in arrearages upon this account, their bodies shall be arrested, and, by the testimony of the auditors, shall be sent into the next jail, and be imprisoned in irons under safe custody, and remain in prison at their own cost until they have satisfied their master (the creditor) fully of their arrearages." It would appear that the practice of arresting on mesne process, that is before judgment, to answer in civil suits, grew out of these statutes; for the subsequent statutes of 25 Edw. III., c. 17 (1350), providing that "such process shall be made in writ of debt, detainee of chattels, and taking of beasts, by writ of *capias*, as is used in writ of account"; and of 21 Hen. VII., c. 9 (1503); evidently have reference to an arrest to answer. Formerly, a writ upon which a suit was commenced was either a *capias*, distress, or summons; either the person of the defendant was seized, and (unless he was bailed) imprisoned until the trial, or his goods or lands were seized as a guarantee of his appearance to answer; and more often, in modern times, to obtain a lien to secure satisfaction of the judgment; or he was only summoned, that is, merely had notice that a suit had been commenced before such a court, by such a plaintiff,

CAPILLARIES — CAPILLARITY

and was to be heard at such a time. The commencement of an action by summons is now the usual course of procedure; recent legislation, and especially the practical abolition of imprisonment for debt, having greatly restricted the use of writs of *capias* of any kind. By the Debtors' Act, 1869 (32 & 33 Vict. c. 62), the writ of *capias ad satisfaciendum* is abolished, except in cases in which the defendant can pay, but will not. The same act provides that when a plaintiff has good cause of action against a defendant to the amount of £50 or upward, and the defendant is about to quit England, and the absence of the defendant from England will materially prejudice the plaintiff in the prosecution of his action, a judge may order the defendant to be arrested unless or until security be found.

Capillaries, kăp'î-lă-rîz, or ka-pîl'a-rîz, the extremely minute blood vessels that make the connection between the arteries and the veins. They are extremely abundant, being present in practically all parts of the body and in enormous numbers. It is by means of the capillaries that most of the interchange of nutrition takes place in the various tissues of the body. The arteries bring the fresh oxygenated blood to the parts, to which it is distributed by the rich network of capillaries, through the walls of which the waste products pass and are carried on by the blood pressure into the veins, to be eliminated by some one of the large excretory organs, the liver, etc., or carried to the lungs to be thus modified or cast off. The arrangement, width, and capacity of the capillaries varies in every tissue of the human body. In general they are arranged as a close network about the parts to which they are distributed, and in width they vary from one two thousandths to one two hundredths of an inch in diameter. See ARTERY; CIRCULATION.

Capillarity, in physics, the rise of a liquid in tubes of very fine diameter to a greater height than the surface of the fluid in which such tubes are immersed; together with certain kindred phenomena. If one end of a tube of this sort, open at both ends, be immersed in a fluid which adheres to glass, as water, the liquor within the tube will rise to a sensible height above the surface of that without. This phenomenon is explained by the attraction which exists between the glass and the fluid. Such liquids as do not adhere to glass (for example, quicksilver) do not rise in the tube; on the contrary, they stand lower within than without it. The mutual action of the elementary particles of matter, of which capillarity is a noted instance, gives rise to phenomena as interesting, and in certain cases as susceptible of being attached to theory by rigorous mathematical reasoning, as the phenomena of universal gravitation. The ascent of liquids in capillary tubes engaged much of the attention of experimental philosophers in the 18th century. Hauksbee found that the ascent of the liquid does not depend in any way on the thickness of the tube, and that when two plates, forming any small angle with each other, are plunged vertically into a fluid, the fluid which rises between them takes the form of an equilateral hyperbola; from which it followed that, in tubes of the same matter, the ascent of the liquid follows the inverse ratio of their interior diameters. In

order to explain these facts succeeding physicists seem to have agreed in assuming the existence of a cohesive force among the particles of the liquid, and an adhesive force between the particles of the liquid and those of the tube. But these attractive forces can only be defined by their relative intensities at an equal distance, and the law according to which they diminish as the distance is increased. Now there are no data from which either their relative intensities or the law of their variation can be determined; we are, therefore, reduced to choose among a number of hypothetical laws, all equally possible; and the explanation, of course, depends on the particular hypothesis we adopt; hence the theories of Clairaut, Young, Laplace, and Poisson.

Clairaut was the first who attempted to reduce the phenomena of capillarity to the laws of the equilibrium of fluids, and exactly analyzed all the forces that concur to elevate the liquid in a glass tube. He showed that the portion of the liquid which is elevated in the tube above the exterior level is kept in equilibrium by the action of two forces, one of which is due to the attraction of the meniscus terminating the column, and the other to the direct attraction of the tube on the molecules of the liquid. Clairaut, however, regarded this last force as the principal one, and even supposed the attraction of the tube to extend as far as its axis; but this supposition is contrary to the nature of molecular forces, which extend only to insensible distances. The action of the tube has, in fact, no influence on the elevation or depression of the contained liquid, excepting in so far as it determines the angle under which the upper surface of the fluid intersects the sides of the tube. Neglecting, therefore, this force as insensible, there remains only the action of the meniscus to support the weight of the elevated column. But though Clairaut made an erroneous supposition respecting the nature of molecular action, and failed in the attempt to demonstrate from theory that the ascent of the liquid is inversely proportional to the diameter of the tube, he showed that a number of hypotheses regarding the law of attraction may be laid down, from any one of which that law of ascent may be deduced; and he demonstrated a very remarkable result, namely, that if the attraction of the matter of the tube on the fluid differs only by its intensity, or coefficient, from the attraction of the fluid on itself, the fluid will rise above the surrounding level when the first of these intensities exceeds half the second.

Young referred the phenomena of cohesion to the joint operation of attractive and repulsive forces, which in the interior of fluids exactly balance each other, and assumed the repulsive force to increase in a higher ratio than the attractive when the mutual distances of the molecules are diminished. From these considerations he was led to discover a very important fact in the theory of capillary action, namely, the invariability of the angle which the surface of the fluid makes with the sides of the tube.

Laplace published his theory of capillary attraction in 1806 and 1807, in two supplements to the *Mécanique Céleste*. Assuming the force of molecular action to extend only to imperceptible distances, he demonstrated that the form of the surface of the liquid is a principal

CAPILLARITY

cause of the capillary phenomena, and not a secondary effect, and determined the part of the phenomena which is due to the cohesive attraction of the molecules of the fluid to each other, as well as that which results from their adhesion to the molecules of the tube. The separate consideration of the cohesive and adhesive forces leads to two equations, which comprehend the whole theory of capillarity—a general equation, common to all those points of the capillary surface of which the distance from the sides of the tube is greater than the radius of the sphere of molecular action; and a particular equation belonging to those points which are situated only at insensible distances from the surface of the tube, or are within the sphere of its action. This last equation will obviously express the angle which the surface of the meniscus makes with the sides of the tube; an angle which, as it depends only on the nature of the tube and that of the liquid, is constant and given in every case, the liquid and tube being supposed homogeneous. Laplace further supposes, in the case of elevation, that an infinitely thin film of the liquid first attaches itself to the sides of the tube, and thus forms an interior tube, which acts by its attraction alone to raise the column, and maintain it at a determinate height. The height of the column, consequently, depends on the cohesion and density of the liquid.

Poisson reinvestigated the whole theory of capillary attraction. Taking the most general case of the problem, he considers not merely the surface of a single liquid, but the surface formed by the contact of two liquids of different specific gravities, placed, the one above the other, in the same tube, and deduces the two equations which determine the form of the separating surface, and the angle under which it intersects the sides of the tube. These equations are in form the same as those of Laplace; but the definite integrals, which express the two constant quantities they include, are very different; and their numerical values would be so likewise, if these, instead of being determined experimentally, could be calculated *à priori* from the analytical expression. This, however, cannot be done without a knowledge of the law according to which the molecules of the liquid attract each other, as well as of that which regulates the action of the tube on the liquid. In applying his general solution to the explanation of the principal phenomena of capillarity, he took occasion to correct some inaccuracies of Laplace. The demonstration which Laplace had given of the invariability of the angle which the surface of the liquid makes with the sides of the tube was not altogether satisfactory; and he had even supposed that it changes its value when the liquid reaches the summit of the tube. Poisson demonstrated that the invariability of this angle will always be preserved, unless the curvature of the interior of the tube is infinitely great; or, in other words, unless its radius is infinitely small and of the same order of magnitude as the radius of the sphere of molecular action. Hence the angle cannot vary when the liquid reaches the summit of the tube; for, however small the radius of the tube may be, it is always incomparably greater than the radius of the sphere of molecular action.

The molecular forces which cause the elevation or depression of a fluid in fine tubes give

rise also to numerous other interesting capillary phenomena. These are displayed at the surface of separation of two liquids, or of a liquid and a gas; sometimes even three fluids may be brought into simultaneous contact, and the phenomena then presented are very remarkable. In the midst of a liquid, the molecular attractions at any point being similar in all directions, and thus counterbalancing each other, may easily remain unnoticed. It is when an abrupt change produces want of symmetry in some direction that they become observable. They give rise, at the surface of separation of two fluids, to resultant forces that act just as would a stretched film containing the fluid; and the variations in these resultant forces causing a corresponding apparent variation in the contractile force of this imaginary film, occasion the phenomena we are about to describe.

The contractility of the film may be seen in the case of a little globule of mercury on a wooden table, or in the case of a soap-bubble. The mercury, instead of spreading itself out over the wood, as it might be expected to do on account of the weight of its parts, is gathered up into a little ball, just as if it were contained in an elastic bag. Again, if a soap-bubble be blown with an ordinary tobacco pipe, it may be shown, by bringing the mouthpiece near to a lighted candle, that the soap-bubble contracts with force enough to send a strong current of air backward through the stem.

The surface contractility is measured by the force required to draw out a band of it of unit breadth, or rather to prevent such a band from contracting. It has been ascertained that if we could cut out a band of the soap-and-water film an inch broad, a force of about six grains would be sufficient to hold it stretched. As there are two surfaces of the soap film, it follows that the superficial contractile force of soap and water exposed to air is about three grains per lineal inch.

M. Quinke, experimenting on this subject, found that the superficial tension for water is greater than for any other liquid that he tried. He determined the superficial tension of various liquids in contact with air, water, and mercury.

When two liquids, whose superficial tensions in air are not the same, are put in contact, both being also in contact with air, curious effects ensue. Thus when a pure water surface is touched with a glass rod that has been wetted with any kind of oil, the surface tension at the point is reduced, and the oil, with very remarkable motions, spreads itself out on the surface of the water. The well-known motions of light particles of camphor thrown on water are accounted for in the same way. This may be beautifully shown by means of an experiment devised by Prof. James Thomson of Glasgow, who first gave an explanation of the phenomenon known as the "tears of strong wine." Let a very well cleaned glass plate be laid on a sheet of white paper, and moistened all over with slightly colored water. Then let a few very small drops of alcohol or spirits be thrown on the plate. The water film will be seen to draw away on all sides from the points where the drops fall owing to the weakening of the superficial tension at these points. The "tears of strong wine" are seen when wine, which contains water and alcohol, is allowed to evaporate in the air. The alcohol evaporates faster than

CAPILUPI — CAPITAL

the water, and as it does so the superficial tension increases. This occurs rapidly in the thin layer of wine that adheres to the sides of a wine glass, and causes the film to be dragged from the places where the wine is strong to those where it is weak. Thus the film is seen to run up the sides of the glass, and then to collect into drops, which run down the side again.

Capilupi, Camillo, Italian poet: b. Mantua in the early part of the 16th century. He was the author of a work issued in 1572 entitled 'The Stratagem of Charles IX. against the Huguenots,' in which the Massacre of St. Bartholomew was justified, and made it appear that the action was premeditated. Cardinal Lorraine, who at the time was attending the Pope in Rome, endeavored to suppress the book from motives of policy.

Capistrano, Giovanni di, jō-vān'nē dē kā-pē-strā'nō, or **Capistranus, Johannes, Saint**, Italian monk: b. Capistrano, a small Neapolitan town of the Abruzzi, 24 June 1386; d. Illock, Slavonia, 23 Oct. 1456. He at first studied law, but in his 30th year, impelled by a vision, entered the Franciscan order, and was soon distinguished by the austerity of his manners, and a great zeal against the numerous heretical sects in Italy. The Popes Martin V., Eugene IV., and Felix V., often employed him as legate and inquisitor in suppressing the sect of the Fraticelli, which had spread widely over Naples and the Papal States. In 1444 he became vicar-general of the strict order of Franciscans called Observants, and in 1450 proceeded as legate to Germany with a view to suppress the Hussites, and rouse the Germans to a crusade against the Turks. His harangues in favor of a crusade against the Turks failing to make much impression on the German princes he resolved to try their effect on the populace, and easily persuaded great numbers to join him in marching against the Turks, who were advancing under Mohammed II., and had closely invested Belgrade, the key of Hungary, with an army of 150,000 men. At the instigation of Capistranus, John Corvinus Hunnyades furnished a force of 60,000, destroyed the Turkish fleet on the Danube, and threw into Belgrade succors both of men and provisions. On this expedition Capistranus in person commanded the left wing of the party, forced his way into Belgrade, repulsed a general assault by the Turks, and on 6 Aug. 1456, in conjunction with Hunnyades, signally defeated the whole Turkish host. His exertions, and the pestilential atmosphere caused by the dead bodies lying unburied around Belgrade, laid him on a sick-bed, and he died in the same year in the Franciscan monastery at Illock.

Capisuccchi, kā-pe-sook'kē, or **Capizucca, Biago**, or **Biasio**, MARQUIS OF MONTERIO, Italian general: b. Rome about the middle of the 16th century; d. 1613. He was in the service of Spain in the Low Countries, under the Duke of Parma, in 1584, afterward becoming lieutenant-general and commander of the army of Ferdinand I. de Medici, duke of Tuscany.

Capisucchi, Paolo, Italian ecclesiastic: b. Rome 1479; d. there 1539. Having become bishop of Neocastro he was summoned to Rome by Clement VII., who referred to him the question of a divorce between Henry VIII. of Eng-

land and Queen Catherine. In this matter Capisucchi made a report against Henry.

Capital, in architecture the uppermost member of a column, that is to say, a separate piece of stone set upon the shaft and supporting an epistyle or the abutment of an arch—in short the mass of the building which is imposed upon the column.

A column must always have a shaft and a capital; without these features it would be a post, perhaps a pillar or a pier, but would have no architectural character. The capital, moreover, has generally received the most elaborate decorative treatment of the whole composition. Thus in Egypt, while the shaft might be cylindrical or conical, the capital would spread out immediately in curves either concave or convex, and would be carved and painted. It is even practicable to divide Egyptian columns into four orders by their capitals, which spread in different ways, and are ornamented by different sculpture, more or less imitative of nature. The idea of the spread given to the capital is, of course, that in this way the superstructure is taken more easily, as it is always and of necessity much larger horizontally than the column itself.

The stone uprights left in rock-cut temples in India and called ordinarily pillars, because of their varied forms—octagonal, square, and the like—are still divided into shaft and capital, though the forms of these are entirely remote from Egyptian or later European examples. Thus, some capitals consist of a mere enrichment of the uppermost band of the shaft and a superincumbent block very elaborately carved. In some cases this upper block gives off corbels and consoles which help to carry the roof by their greater spread.

The capitals which have excited the most interest among European students of art are those of the three Greek orders and of the five Renaissance orders which were deduced from the first three. The capital of the Grecian Doric is a reversed cone rounded off at top and carrying a square plinth or die; this plain *echinus* was richly painted in bright colors. The capital of the Ionic order is a curious device consisting of scrolls or volutes, two on each of the two opposite sides, so that this capital, almost alone, has not the same appearance from every point of view. The capital of the Corinthian order is a circular bell, surrounded by acanthus leaves and having at each corner a couple of projecting scrolls not unlike those of the Ionic order but small. This Corinthian order received many modifications in ancient Roman practice, and one of these was erected by the Renaissance men into a separate order, the so called Composite. From the Grecian Doric the Roman Doric took shape, and this was used by the Renaissance men, while a still simpler order was made from it and called the Tuscan. The capitals of these two orders are very thin and low in vertical measurement, and consist of moldings running round the continuation of the shaft, and either plain or slightly carved into the simplest of the egg and dart moldings or the like.

In mediæval architecture, both Romanesque and Gothic, the capitals are almost infinitely varied. The strong tendency of the time toward elaborate carving made this block of stone, from 5 to 20 feet above the aisles and in a prominent place, a most tempting vehicle for sculpture, and

CAPITAL

the abandonment of the classical orders left every artist free to design his own system of leafage, animal forms and the like. In this way mediæval capitals are often of extraordinary beauty; but no attempt has been made to classify them except as they form part of a style. See COLUMN.

RUSSELL STURGIS.

Capital, in political economy, the accumulated wealth, in possession of individuals or of a community, which is available for use in further production. In estimating the capital of any individual we necessarily take into consideration the debts due to and from him; and many men of large capital are only possessed of claims upon others; their whole stock is in the hands of others at interest; and they have only promises for a certain amount of money, and actually possess neither lands nor goods to any considerable value; while others possess large quantities of both, and yet have little or no capital, since they owe in money the value of the greater part or the whole of their possessions. Now it is plain that no individual can undertake production, to any large extent, without an extensive stock. He must have land to cultivate, or materials to work up, and implements to work with. Even a savage must have a capital, such as his hut, clothes, cooking utensils, food enough to support him until he can obtain a new supply, and implements, such as a hatchet, gun, canoe, fishing gear, to procure this supply. The first effort of industry is to supply the implements, apparatus, and machinery for his own employment; and as society and the arts advance, and the operations of industry are extended, the implements, apparatus, machinery, and materials requisite in conducting the processes of production must be proportionally accumulated; and these will constitute a part of the capital of a community, and also of an individual, which is essential to success in productive processes. And these can be commanded by any one in proportion to the extent of his individual capital; or, if he have credit, then his resources for production will depend upon the capital of others—in other words, that of the community to which he belongs.

In considering the aggregate capital of a community we may put out of the question all the debts due from any of the members to others; for, whether these be great or small—and they will vary according as the practice of giving credit is more or less in use—still the capital of the community will consist in its lands, buildings, ships, machinery, materials on hand, implements; in short, in all those things which bear a value in the market. Provided the community owes no debt abroad, these will constitute its aggregate capital; and, if its members are indebted abroad, we find its actual net capital, as in the case of an individual, by deducting the amount of its debts from the value of its possessions, without regarding the debts due from some of its members to others.

Capital has long been recognized as necessary as an auxiliary to labor, despite the fact that in more recent times it has been urged by unscholarly writers and by demagogues that capital is really the tyrant of labor and that the latter could readily dispense with it. The cultivator of the soil demands a spade or a plow, the blacksmith an anvil, hammer, and bellows, etc. All trades and industries demand certain instru-

ments,—tools, raw material, every kind of supplies, and all these are capital. This, being true on a more primitive basis, is proportionately truer in a civilized state, where labor is complicated and returns are not immediate. "In that rude state of society," says Adam Smith, "in which there is no division of labor, in which exchanges are seldom made, and in which every man provides everything for himself, it is not necessary that any stock should be stored up in order to carry on the business of the society. . . . But when the division of labor has once been thoroughly introduced, the produce of a man's own labor can supply but a very small part of his occasional wants. The far greater part of them are supplied with the produce of other men's labor, which he purchases with the produce, or, what is the same thing, with the price of the produce of his own. But this purchase cannot be made till such time as the produce of his own labor has not only been completed but sold. A stock of goods of different kinds, therefore, must be stored up somewhere sufficient to maintain him and to supply him with the materials and tools of his work." At any given time, capital may be arranged under the three heads above indicated—subsistence, tools, and materials.

An owner of capital, possessing an amount larger than he is capable of using in his own work, obtains the labor of others. He either attempts an industry with the assistance of workmen to whom he pays a remuneration agreed upon, or diverts a portion of his capital as a loan, or as stock, or in some other way, such capital being made effective by others. On the contrary one not possessing capital adequate to the useful employment of his activities, undertakes the combination of his labor with the capital of another. This combination may vary according to circumstances, and may of course be at times unfavorable to labor.

Capital is distinguished into floating or movable, and fixed; the former consisting of things that may be transferred by delivery of any kind from place to place, the latter of land, houses, and other property which must be taken delivery of in the place where they stand. Another use of the distinction is made to represent the difference between the permanent plant of a business and the current capital necessary to carry it on. Capital may thus be said to be fixed either when it is physically incapable of being moved, or when it is rendered immovable by the permanent arrangement of its owner. Thus one carrying on a flour-mill wants a floating or disposable capital, over and above the cost of his works, to be invested in wheat to be floured, and flour not yet disposed of. This instance illustrates what is meant by the floating or disposable capital of a whole community, being that movable exchangeable stock of things on hand, over and above the fixtures and apparatus of production, including lands, buildings, ships, working animals, all the implements of the arts, with necessary food, clothing, and a stock of seed sufficient for the time requisite for reproduction. What remains over these is the disposable capital, and, in a flourishing community, the disposable floating capital is constantly invested in new fixed capital, implements and apparatus of production. A declining community, on the contrary, consumes a part of its implements and apparatus of in-

CAPITAL — CAPITAL PUNISHMENT

dustry; or what is in effect the same thing, it does not repair and replace the damage of use and decay. The idea is held out in many economical treatises that a community cannot have a surplus capital; that is, it cannot have more capital than it can make use of in its consumption and reproduction. As no grounds whatever are given for this doctrine, it seems to be hardly entitled to a consideration; for the position is certainly, at the first view, very improbable, since we know very well that men may accumulate; and why they may not, in any possible case, accumulate a surplus, does not appear by any plausible reason, and whether such surplus accumulation may be useful or not will depend entirely upon the kind of articles of which such accumulation consists. If it consist in articles the value of which depends on the prices in foreign markets the excess may be of no value at all; for it may so depress the foreign prices as to countervail all the direct advantage arising from the cheaper supply, for a time, of the domestic demand.

Fictitious capital generally means nothing more nor less than excessive credits, which throw the management and disposition of a great deal of property into the hands of persons who are not able to answer for the risks of loss from its bad management, or other causes. A whole community, in the aggregate, can have fictitious capital only in case of its members having an excessive credit in a foreign country. But the members may, among themselves, have a fictitious capital by too great credits in their dealings with each other, and the fiction, in this case, is in their false promises of payment. See *POLITICAL ECONOMY; TRUSTS; WAGES.*

Capital (*Das Kapital*), a noted work by Karl Marx, published in 1867. English translation edited by Fred Engels, 1887. A book of the first importance, by the founder of international socialism. The conservative aspect of Marx's teaching is in the fact that he honestly seeks to understand what, apart from any man's opinion or theory, the historical development actually is; and that he does not think out and urge his own ideal programme of social reform, but strives to understand and to make understood what must inevitably take place.

Capital Punishment (Latin, *caput*, "the head"; hence *capitalis*, "pertaining to or affecting the head"; hence "affecting the life"), the punishment of death. The questions most commonly discussed by philosophers and jurists under this head are: (1) as to the right of governments to inflict the punishment of death; (2) as to the expediency of such punishment; (3) as to the crimes to which, if any, it may be most properly confined and limited; (4) as to the manner in which it should be inflicted.

1. As to the right of inflicting the punishment of death. This has been doubted by some distinguished persons; and the doubt is often the accompaniment of a highly cultivated mind, inclined to the indulgence of a romantic sensibility, and believing in human perfectibility. The right of society to punish offenses against its safety and good order will scarcely be doubted by any considerate person. In a state of nature individuals have a right to guard themselves from injury, and to repel all aggressions by a force or precaution adequate to the object. This results from the right of self-

preservation. If a person attempts to take away my life, I have, doubtless, a right to protect myself against the attempt by all reasonable means. If I cannot secure myself but by taking the life of the assailant, I have a right to take it. It would otherwise follow that I must submit to a wrong, and lose my life rather than preserve it by the means adequate to maintain it. It cannot, then, be denied, that in a state of nature men may repel force by force, and may even justly take away life, if necessary, to preserve their own. When men enter society, the right to protect themselves from injury and to redress wrongs is transferred generally from the individuals to the community. We say that it is generally so, because it must be obvious that in many cases the natural right of self-defense must remain. If a robber attacks one on the highway, or attempts to murder him, it is clear that he has a right to repel the assault, and to take the life of the assailant if necessary for his safety; since society in such a case could not afford him any adequate and prompt redress. The necessity of instant relief, and of instant application of force, justifies the act, and is recognized in all civilized communities. When the right of society is once admitted to punish for offenses, it seems difficult to assign any limits to the exercise of that right, short of what the exigencies of society require. If a state have a right to protect itself and its citizens in the enjoyment of its privileges and its peace, it must have a right to apply means adequate to this object. The object of human punishments is, or may be, threefold: (1) to reform the offender; (2) to deter others from offending; and (3) to secure the safety of the community, by depriving the offender of the power of doing mischief. The first consideration rarely enters into human legislation, because of the inadequacy of our means to produce great moral results by the infliction of punishment. The two latter considerations enter largely into the theory and practice of legislation. Who is to be the judge in such cases? what is the adequate punishment for any offense? Certainly punishments ought not to be inflicted which are utterly disproportionate to the offense, and beyond the exigencies of society. No government has a right to punish cruelly and wantonly and from mere revenge; but still, the discretion must be vested somewhere, to say what shall be the degree of punishment to be assigned to a particular offense. That discretion must be, from its nature, justly a part of the legislative power, and to be exercised according to the actual state of society. It may,—nay, it must,—be differently exercised in different ages and in different countries; for the same punishment which in one age or country may be sufficient to suppress an offense, or render it comparatively harmless, may, in another age or country, wholly fail of the effect. If mild punishments fail of effect, more severe ones must be resorted to if the offense be of a nature which affects society in its vital principles, or safety, or interests. The very frequency of a crime must often furnish a very strong ground for severe punishment, not only as it furnishes proof that the present punishment is insufficient to deter men from committing it, but from the increased necessity of protecting society against dangerous crimes. But it is often said that life is the gift of God,

CAPITAL PUNISHMENT

and therefore it cannot justly be taken away, either by the party himself or another. If he cannot take it away, he cannot confer that power on others. But the fallacy of this argument is obvious. Life is no more the gift of God than other personal endowments or rights. A man has, by the gift of God, a right to personal liberty and locomotion, as well as to life; to eat and drink and breathe at large, as well as to exist, yet no one doubts that, by way of punishment, he may be confined in a solitary cell; that he may be perpetually imprisoned or deprived of free air, or compelled to live on bread and water. In short, no one doubts that he may be restrained in the exercise of any privileges or natural rights short of taking his life. Yet the reasoning, if worth anything, extends to all these cases in an equal degree. If, by his crimes, a man may justly forfeit his personal rights, why not his life? But we have seen that it is not true, even in a state of nature, that a man's life may not be taken away by another if the necessity of the case requires it. Why, then, may not society do the same if its own safety requires it? Is the safety of one person more important than the safety of the whole community? Then, again, as to a man's inability to confer on others a right which he does not himself possess. Suppose it is so; the consequence which is deduced from this does not, in fact, arise. Blackstone, indeed, seems to deduce the right of society to punish capital offenses in certain cases (that is, in cases of *mala prohibita* and not *mala in se*) from the consent of the offenders. The Marquis Beccaria, on the other hand, denies that any such consent can confer the right, and therefore objects to its existence. But the notion of consent is, in nearly all cases, a mere theory, having no foundation in fact. If a foreigner comes into a country and commits a crime at his first entrance, it is a very forced construction to say that he consents to be bound by its laws. If a pirate commits piracy, it is absurd to say that he consents to the right of all nations to punish him for it. The true and rational ground on which the right rests is not the consent of the offender, but the right of every society to protect its own peace, interests, property, and institutions, and the utter want of any right in other persons to disturb, or destroy, or subtract them. The right flows, not from consent, but from the legitimate institution of society. If men have a right to form a society for mutual benefit and security, they have a right to punish other persons who would overthrow it. There are many cases where a state authorizes life to be taken away, the lawfulness of which is not doubted. No reasonable man doubts the right of a nation, in a just war, especially of self-defense, to repel force by force and to take away the lives of its enemies. And the right is not confined to repelling present force, but it extends to precautionary measures which are necessary for the ultimate safety of the nation. In such a war a nation may justly insist upon the sacrifice of the lives of its own citizens, however innocent, for the purpose of ensuring its own safety. Accordingly we find that all nations enrol militia and employ troops for war, and require them to hazard their lives for the preservation of the state. In these cases life is freely sacrificed by the nation; and the laws enacted for such purposes are deemed just

exercises of power. If so, why may not life be taken away by way of punishment if the safety of society requires it? If a nation may authorize, in war, the destruction of thousands, why may it not authorize the destruction of a single life, if self-preservation require it? The mistake, however, is in supposing that life cannot be taken away without the consent of the party. If the foregoing reasoning be correct, such consent is neither supposed nor necessary. In truth, the supposition of an original compact between all the persons who are subject to the regulations of a society, by their own free consent, as the necessary and proper basis on which all the rights of such society depend, is at best a gratuitous supposition, and it sometimes leads to very incorrect results. It may be added that the Scriptures most clearly recognize and justify the infliction of capital punishments in certain cases.

2. As to the expediency of capital punishment. This opens a wide field for discussion. Some able men who do not doubt the right do still deny the expediency of inflicting it. It may be admitted that a wise legislature ought to be slow in affixing such a punishment to any but very enormous and dangerous crimes. The frequency of a crime is not of itself a sufficient reason for resorting to such a punishment. It should be a crime of great atrocity and danger to society, and one which cannot otherwise be effectually guarded against. In affixing punishments to any offense, we should consider what are the objects and ends of punishment. It is clear that capital punishment can have no effect in reforming the offender himself. It may have, and ordinarily does have, the effect of deterring others from committing a like offense; but still, human experience shows that even this punishment, when inflicted for small offenses, which are easily perpetrated, and to which there is great temptation, does not always operate as an effectual terror. Men are sometimes hardened by the frequent spectacles of capital punishments and grow indifferent to them. Familiarity deprives them of their horror. The bloodiest codes are not those which have most effectually suppressed offenses. Besides, public opinion has great weight in producing the acquittal or condemnation of offenders. If a punishment be grossly disproportionate to the offense, if it shock human feelings, there arises, insensibly, a sympathy for the victim and a desire to screen him from punishment; so that, as far as certainty of punishment operates to deter from crimes, the object of the legislature is often thus defeated. It may be added that a reasonable doubt may fairly be entertained whether any society can lawfully exercise the power of punishing beyond what the just exigencies of that society require. On the other hand, a total abolition of capital punishments would, in some cases at least, expose society to the risk of deep and vital injuries. A man who has committed murder deliberately has proved himself unfit for society and regardless of all the duties which belong to it. The safety of society is most effectually guarded by cutting him off from the power of doing further mischief. If his life be not taken away, the only other means left are confinement for life or transportation and exile for life. Neither of these is a perfect security against the commission of other crimes, and may not always be

CAPITAL PUNISHMENT

within the power of a nation without great inconvenience and great expense to itself. It is true that the latter punishments leave open the chance of reform to the offender, which is indeed but too often a mere delusion; but, on the other hand, they greatly diminish the influence of another salutary principle, the deterring of others from committing like crimes. It seems to us therefore that it is difficult to maintain the proposition that capital punishments are at all times and under all considerations inexpedient. It may rather be affirmed that in some cases they are absolutely indispensable to the safety and good order of society. Some states have, however, entirely abolished capital punishment, as is the case in Holland, Rumania, Portugal, a certain number of the Swiss cantons, and some States of the American Union. It was entirely abolished in Switzerland in 1874, but a few years after, owing to the increase of murders, it was again made permissible. It was also for a time done away with in Austria and in one or two of the States of this country.

3. As to the crimes to which capital punishments may most properly be limited. From what has been already said it is plain that this must depend upon the particular circumstances of every age and nation; and much must be left to the exercise of a sound discretion on the part of the legislature. As a general rule humanity forbids such punishments to be applied to any but crimes of very great enormity and danger to individuals or the state. If any crimes can be effectually suppressed by moderate means, these ought certainly to be first resorted to. The experience, however, of most nations, if we may judge from the nature and extent of their criminal legislation, seems to disprove the opinion so often indulged by philanthropists that capital punishments are wholly unnecessary. The codes of most civilized nations used to abound with capital punishments. That of Great Britain long continued to be very sanguinary. Blackstone, in his 'Commentaries,' admits that in his time not less than 160 crimes were by the English law punishable with death. Forgery was one of these up to the reign of William IV. The only crimes for which capital punishment may now be inflicted, according to the law of England, are high treason and murder. The law in Scotland is substantially the same, a sentence of capital punishment now being competent only in cases of treason, murder, and attempts to murder in certain cases. By United States statutes nine crimes are so punishable, including treason, murder, arson, rape, piracy, and robbery of the mail. In several States of the Union still fewer crimes are generally punishable with death. Beyond treason, murder, arson, piracy, highway robbery, burglary, rape, and some other offenses of great enormity and of a kindred character, it is extremely questionable whether there can be necessity or expediency in applying so great a severity. Beccaria, with his characteristic humanity and sagacity, has strongly urged that the certainty of punishment is more important to deter from crimes than the severity of it.

4. As to the manner of inflicting the punishment of death. This has been different in different countries, and in different stages of civilization in the same countries. Barbarous nations are generally inclined to severe and

vindictive punishments; and, where they punish with death, to aggravate it by prolonging the sufferings of the victim with ingenious devices in cruelty. And even in civilized countries, in cases of a political nature or of very great atrocity, the punishment has been sometimes inflicted with many horrible accompaniments. Tearing the criminal to pieces, piercing his breast with a pointed pole; pinching to death with red-hot pincers; starving to death; breaking his limbs upon the wheel; pressing to death in a slow and lingering manner; burning at the stake; crucifixion; sawing to pieces; quartering alive; exposure to wild beasts; and other savage punishments, have been sometimes resorted to for the purposes of vengeance, public example, or public terror. Compared with these the infliction of death by drowning, strangling, poisoning, bleeding, beheading, shooting, or hanging is a moderate punishment. In modern times public opinion is strongly disposed to discountenance the punishment of death by any but simple means; and the infliction of torture is almost universally reprobated. Even in governments where it is still countenanced by the laws it is rarely resorted to; and the sentence is remitted, by the policy of the government, beyond the simple infliction of death. In Prussia, where atrocious criminals were required by the penal code to be broken upon the wheel, the king latterly used always to issue an order to the executioner to strangle the criminal (which was done by a small cord not easily seen) before his limbs were broken. So in the same country, where robbery attended with destruction of life was punished by burning alive, the fagots were so arranged as to form a kind of cell in which the criminal was suffocated by the fumes of sulphur, or other means, before the flame could reach him. Not only is torture now abolished by civilized nations, but even the infliction of capital punishment in public has been given up by most of them. In England, in high treason, the criminal is sentenced to be drawn to the gallows, to be hanged by the neck until he be dead, to have his head cut off, and his body divided into four parts, and these to be at the disposal of the Crown. But, generally, all the punishment is remitted by the Crown, except the hanging and beheading, and these too may be altogether remitted according to circumstances. In other cases the punishment is now simply by hanging, or, in the military and naval service, by shooting. In France formerly the punishment of death was often inflicted by breaking the criminal on the wheel. The usual punishment now is beheading by the guillotine. In 1853 a kind of guillotine (*Fallschwert*) was introduced into the kingdom of Saxony, and it has since been adopted as the means of execution in several other German states. In Austria the general mode of punishment is by hanging. In Prussia hanging is rarely inflicted; but the usual punishment is beheading with a heavy axe, the criminal's head being first tied to a block. In one or two German states execution by the sword still exists. It should be remarked, however, that in Germany hanging has always been deemed the most infamous sort of punishment; and the sentence has often been commuted for beheading by the sword as a milder or less dishonorable mode of punishment. In the United States of America hanging is the almost universal mode of capital punish-

CAPITALS — CAPITO

ment, though electricity has recently been tried. The Constitution of the United States contains a provision against "cruel and unusual punishments." In China decapitation by the sword is the usual form: murderers are cut to pieces; robbers not. In Russia the punishment of death has been frequently inflicted by the knout. In Turkey strangling and sewing the criminal up in a bag, and throwing him into the sea, are common modes of punishment. In the Roman code many severe and cruel punishments were prescribed. During the favored times of the republic many of these were abolished or mitigated. But again, under the emperors, they were revived with full severity. In the ancient Grecian states the modes of punishment were also severe and often cruel. The ancient Greek mode of capital punishment by taking poison at such hour as the condemned party should choose, seems never to have been in use among any Christian people.

Whether execution ought to be public or private has been a question much discussed, and one upon which a great diversity of opinion exists among intelligent statesmen. On the one hand, it is said that public spectacles of this sort have a tendency to brutalize and harden the people, or to make them indifferent to the punishment; and the courage and firmness with which the criminal often meets death have a tendency to awaken feelings of sympathy, and even of admiration, and to take away much of the horror of the offense as well as of the punishment. On the other hand it is said that the great influence of punishment in deterring others from the like offense cannot be obtained in any other way. It is the only means to bring home to the mass of the people a salutary dread and warning; and it is a public admonition of the certainty of punishment following upon crime. It is also added that all punishments ought to be subjected to the public scrutiny, so that it may be known that all the law requires, and no more, has been done. Since 1868 the law of the United Kingdom has required all executions to take place privately within the prison walls, and this system seems to have given general satisfaction. The same method is also practised in various other countries. In 1870 a similar measure was proposed in the French Assembly, but the war prevented it being passed and it is not yet law.

In England, the court before which the trial is held declares the sentence and directs the execution of it. In the courts of the United States there is a like authority; but in the laws of many of the States there is a provision that the execution shall not take place except by a warrant from the governor, or other executive authority. In cases of murder and other atrocious crimes the punishment in England is usually inflicted at a very short interval after the sentence. In America there is usually allowed a very considerable interval, varying from one month to six months. In Great Britain there lies no appeal from the verdict of a jury and the sentence of a court, in capital cases, and the very fact that the verdict and sentence are final produces great caution and deliberation in the administration of criminal justice, and a strong leaning toward the prisoner on trial. In the United States there is considerable latitude of appeal. In France there may be a review of it in the court of cassation. In Ger-

many there is, in criminal as in civil cases, a right of appeal; hence, in that country, few innocent persons have suffered capitally since the 16th century. Capital punishment cannot be inflicted, by the general humanity of the laws of modern nations, upon persons who are insane or who are pregnant, until the latter are delivered and the former become sane. It is said that Frederick the Great required all judgments of his courts condemning persons to death, to be written on blue paper; thus he was constantly reminded of them as they lay on his table among other papers, from which they were readily distinguished. He usually took a long time to consider such cases, and thus set an excellent example to sovereigns of their duty.

Capitals (*majuscula*), the large letters used in writing and printing, most commonly as the initial letters of certain words, or of all words in certain positions, and distinguished from the small letters (*minuscula*). As among the ancient Greeks and Romans, so also in the early part of the Middle Ages, all books were written without any distinction in the kind of letters used; but gradually the practice became common of beginning a book, subsequently, also, the chief divisions and sections of a book, with a large capital letter, usually illuminated and otherwise richly ornamented. In legal or state documents of the 13th century capital letters are found dispersed over the text as the initial letters of proper names, and of the names of the Deity, and in the next century the same usage was followed in ordinary manuscripts. The practice with regard to the use of capitals varies in different countries. Sentences and proper names begin almost universally with capitals, but there are several other cases in which the usage is not so general. In English there cannot be said to be any invariable rule regulating their use. The first personal pronoun is always written and printed with a capital letter, and it is common also to begin titles and the names of well-known public bodies, societies, institutions, etc., with capitals. Formerly, it was a frequent practice to begin all substantives in English with a capital, which is still the rule in German. The Germans also begin all titles and pronouns of address with capitals, but not the first personal pronoun. One point in which the English practice differs from that of Germany, France, Italy, and other continental countries, is in beginning adjectives derived from proper names, such as Spanish, Italian, etc., like proper names themselves, with capitals, such adjectives being printed in other countries entirely with small letters.

Capitanis, kăp-i-tă'nēs. See ARMATOLES.

Capitation is applied to anything that concerns a number of persons individually. Thus a capitation-tax is a tax imposed upon all the members of a state, each of whom has to pay his share, and is distinguished from taxes upon merchandise, etc. A capitation-grant is a grant given to a number of persons, a certain amount being allowed for every individual among the number.

Capito, or **Kopfel**, **Wolfgang Fabricius**, wŏlf'gang fā-brēt'sē-oos cā'pē tō, or kēp'fēl, Alsatian reformer: b. Haguenaue, 1478; d. Strassburg, November 1541. Entering the Benedictine order, he became professor of theology at Basel, where he showed in his lectures

CAPITOL—CAPITOL AT WASHINGTON

a tendency to shake off the trammels of the scholastic writers. He approved of Luther's action, but nevertheless in 1519 entered the service of Albert of Mainz; and it was not till some years later that he finally declared for the Reformation. He then entered zealously into its work, shared with Bucer the composition of the *Confessio Tetrapolitana*, and took part in the Synod of Bern in 1532.

Capitol, now *Campidoglio*, the citadel of ancient Rome, standing on the Capitoline Hill, the smallest of the seven hills of Rome, anciently called the Saturnine and the Tarpeian Rock. It was planned and said to have been begun by Tarquinius Priscus, but not completed till after the expulsion of the kings. At the time of the civil commotions under Sulla it was burned down, and rebuilt by the senate. It again suffered the same fate twice, and was restored by Vespasian and Domitian. The latter caused it to be built with great splendor, and instituted there the Capitoline games. Dionysius says the temple, with the exterior pillars, was 200 feet long and 185 broad. The whole building consisted of three temples, which were dedicated to Jupiter, Juno, and Minerva, and separated from one another by walls. In the wide portico triumphal banquets were given to the people. The statue of Jupiter, in the capitol, represented him sitting on a throne of ivory and gold, and consisted in the earliest times of clay painted red. Under Trajan, it was formed of gold. The roof of the temple was made of bronze; it was gilded by Quintus Catulus. The doors were of the same metal. Splendor and expense were lavished upon the whole edifice. On the pediment stood a chariot, drawn by four horses, at first of clay, and afterward of gilded brass. The temple itself contained an immense quantity of the most magnificent presents. The most important papers were preserved in it. The Capitoline Hill consists of three parts, namely, the northern summit, now occupied by the church of Santa Maria in Aracœli; the southern summit, crowned by the Palazzo Caffarelli, now occupied by the German ambassador; and the depression between these, in which is now the Piazza del Campidoglio. The above church, which is approached from the northwest by a lofty flight of steps, is of great antiquity. In 1888 the Franciscan monastery which was connected with it was replaced by a large monument of Victor Emmanuel II. The Piazza del Campidoglio was designed by Michael Angelo. In its centre is a fine equestrian bronze statue of Marcus Aurelius. On the southeast side there is the Palazzo del Senatore, with a fine flight of steps erected by Michael Angelo. The Palace of the Conservatori occupies the southwest side of the square, and contains valuable collections in art and antiquities. Directly opposite is the Capitoline Museum, founded by Innocent X. The southern summit of the hill is now called Monte Caprino, and on it, beside the Palazzo Caffarelli already mentioned, stands a hospital and a German archæological institute. (See *ROME*.) Besides the edifice in Washington where Congress assembles, some of the statehouses in States of the Union are officially called capitols.

Capitol at Washington, History of the. After the national capital had been located on the Potomac in 1789, Washington and Major

P. C. L'Enfant selected sites for the public buildings. On the first map (1791), the "Congress House" is situated as now, on a low hill commanding the best view in Washington, with 12 broad streets radiating from it, so that it closes the vista of every main avenue. On the decision of a board of three commissioners, with Washington and Jefferson, the plans of the capitol and the President's house were given out in 1792 to public competition, for a prize of \$500 or a medal of that value, at the winner's option. For the President's house James Hoban's plans were accepted at once, and he was made superintendent of its erection. For the capitol none were satisfactory, but the three foremost competitors were given another trial, and one, Stephen Hallet, a French artist living in Philadelphia, was employed at a salary and indemnity to revise his plans under the commissioners' criticism. But later in the year Dr. William Thornton (q.v.) of Tortola Island, W. I., submitted plans whose "grandeur, simplicity, beauty, and convenience" forced the committee to accept them. They were too grand for the commissioners' ideas of national needs or resources at the time, however, and specified too costly materials. Thornton wished marble and mahogany and the best of construction, and under a bitter assault from several of his rejected competitors, headed by Hallet, whom the commissioners had joined with Thornton in a revising board, he was forced to reduce its scale and material greatly. Their suggested modifications of his general plan were, however, disapproved. These plans were for what is now the central portion of the capitol.

Work was begun about 1 August. The corner-stone was laid 18 September in the southeast corner of the old north wing, now the supreme court section, with imposing ceremonies, Masonic rites and procession, and a barbecue. Hoban was made superintendent, and Hallet his assistant; but Hoban gave his whole time to the White House, as the President's house came to be called, and Hallet was the real manager. He proceeded to change Thornton's plans and specifications at will, was repeatedly censured for it, and at last ordered to stop it. He resigned, but refused to give up the drawings; the commissioners at last secured them and discharged him, 15 Nov. 1794. Thornton, now one of the commissioners of the District of Columbia, was asked by Washington to obliterate Hallet's changes as injurious, and did so. Hoban now acted as superintendent until George Hadfield, an English architect, was engaged to succeed Hallet, on Jonathan Trumbull's recommendation of him as a modest man and good artist. He outdid Hallet; spent his whole energy in fighting Thornton and Hoban (who always worked in harmony), and after repeated resignations and reconsiderations, was discharged for practical incompetence 10 May 1798. Hoban again took charge. On 17 Nov. 1800 the second session of the sixth Congress met in the north wing of the building. Much of this early construction was of wood or poor material. This was on account of haste, the local interests being very urgent for the coming of the government to that seat. A few years later more durable material was substituted. The commissionership was abolished May 1802, and Thornton and Hoban ceased direct superintendence, though often called in

THE NATIONAL CAPITOL, WASHINGTON, D. C.

CAPITOLINE GAMES—CAPITULARY

consultation. At this time the north wing was complete, the foundation of the central rotunda and dome in place, and the basement story of the south wing partly done. These are still as Thornton planned them.

On 6 March 1803 Jefferson appointed Benjamin H. Latrobe (q.v.) "surveyor of public buildings." He at once began, like the others, to besiege the President with the bitterest assaults on Thornton's designs, and when the former declined to interfere, appealed to Congress. Thornton, however, now in charge of the patent office, though he defended himself with severity, made no further attempt to prevent the alteration of his plans; and Latrobe made many serious changes, some of them since judged harmful to beauty and utility. Thus, the Representatives' hall was changed from a graceful, ellipse to a square with semicircular ends; a bad echo gave trouble for many years, caused by the changes. The number and size of entrances to the rotunda were curtailed, the splendid open staircases, cut down and placed in obscurity, were difficult for strangers to find; and the grand semicircular western portico was abolished. The principal entrance was also changed from the west front, facing the White House, to the eastern side. Latrobe was constantly in hot water with both Jefferson and Congress, and published a pamphlet against them in 1806; but till 1811 had pretty much his own way. When the War of 1812 broke out, the capitol consisted of the north and south wings, connected by a corridor of rough boards over the central foundations. On 24 Aug. 1814 the British burnt it as far as possible, piling the furniture and platforms in the rooms with rocket stuff and igniting them; the interior was dreadfully damaged, but the outside walls remained, also the inside brickwork and some stone. A strong movement arose for removing the capital elsewhere; but the same considerations prevailed against it as later. In fear of such a result, however, the local interests formed the "Capitol Hotel Company," and erected a building for government occupancy till the repairs on the capitol were finished. It was occupied, 1815-19, and was afterward known as the "Old Capitol," and used in the Civil War as a military prison. In the reconstruction the House wing was entirely altered.

Near the end of 1817 Latrobe became embroiled with a new commissioner of the Federal building, Samuel Lane, and resigned. In his place was appointed Charles Bulfinch (q.v.), from 1 Jan. 1818; he remained supervising architect for the next decade. In the winter of 1819-20 Congress took its seat in the new hall. The centre was pushed forward to completion, and on 10 Dec. 1824, the entire interior was finished. In 1825 a public competition was held for the figures on the pediment of the eastern portico. From 1826 on Bulfinch was employed on special detail, and the landscape gardening and work on the grounds, which were of his designing. The capitol was set in a park of 22½ acres, encircled by an iron railing somewhat taller than a man, affixed in the sandstone coping of a low wall. There were four carriage and five pedestrian entrances. On 2 March 1828 the position of architect of the capitol was abolished; but Bulfinch remained in employment till the end of June 1829, when Jackson dismissed him. He designed and planned the modern

form of the then west extremity of the building, the Senate galleries, and the terraces on the east; and made the dome higher than in Thornton's plan. Among others who should have great credit for the beauty of the capitol are Peter Lenox, clerk of works under Latrobe; George Blagden, superintendent of stone-cutters; and Giovanni Andrei, an Italian, superintendent of carvers. That so beautiful and harmonious a structure should have emerged from the contentions of so many different minds is due partly to the really great ability of the three chief architects, Thornton, Latrobe, and Bulfinch, and partly to the determination of successive Presidents that the changes should harmonize with the original design. Latrobe's material external alterations of Thornton's plan have been mentioned; Bulfinch designed the western central portico as it now stands.

From 1829 to 1836 there was no architect of the capitol. On 6 June 1836, Jackson appointed as Federal architect Robert Mills (q.v.), who had studied under Latrobe; and he held the place till 1851. Thomas U. Walter (q.v.) then took the post, having drawn the plans for the two modern wings that extended the original capitol, which the government needs had outgrown, into the modern one. The corner-stone of the extension was laid by President Fillmore, 4 July 1851; the new Representatives' hall was occupied in 1857; the Senate hall in 1859. The great lengthening of the dimensions required a correspondent heightening of the dome; and Mr. Walter designed a new one, which was constructed during the Civil War, and completed at the close of 1863, the statue of Freedom being then lifted into place. Mr. Walter, however, had foreseen a future need of still further extension, and had drawn plans for it while the other work was going on. These have been awaiting their time since; and Congress in the spring of 1903 authorized their execution, at a probable expenditure of \$2,500,000 and three years' time, under the supervision of the present Federal architect, Mr. Woods. This extension is to the eastward, and involves the removal of Latrobe's portico at the east front, but none of the old walls. The present front wall will become the rear wall of an open court, which is to light the west side of the addition. This will contain 66 new and handsome rooms, divided equally between the Senate and the House. (For a minute history of the capitol down to 1851, see Glenn Brown in the 'American Architect,' Vols. LXII-LXV.).

Capitoline Games, games held in ancient Rome in celebration of the deliverance of the city from the Gauls, and in honor of Jupiter Capitolinus, to whom they ascribe the salvation of the capitol in the hour of danger. They were instituted 387 B.C., after the departure of the Gauls.

Capitolinus, Julius, Roman historian, who lived toward the end of the 3d century, and wrote the lives of nine emperors. He is one of the writers of the 'Historia Augusta,' in the editions of which his works are to be found.

Capitulary, *ka-pit'ü-la-rî* (Lat. *capitula*, "chapters"), a writing divided into heads or chapters, especially a law or regal enactment so divided into heads. Laws known by this designation were promulgated by Childebert, Clothaire, Carloman, and Pepin, kings of France;

CAPITULATION—CAPO D'ISTRIA

but no sovereign seems to have put forth so many of them as the Emperor Charlemagne, who appears to have wished to effect, in a certain degree, a uniformity of law throughout his extensive dominions. With this view it is supposed he added to the existing codes of feudal laws many other laws, divided or arranged under small chapters or heads, sometimes to explain, sometimes to amend, and sometimes to reconcile or remove the differences between them. These were generally promulgated in public assemblies composed of the sovereign and the chief men of the nation, both ecclesiastical and secular. They regulated equally the spiritual and temporal administration of the kingdom; and the execution of them was entrusted to the bishops, the courts, and the *missi regii*, officers so called because they were sent by the French kings of the first and second race to dispense law and justice in the provinces. Many copies of these capitularies were made, one of which was generally preserved in the royal archives. The authority of the capitularies was very extensive. It prevailed in every kingdom under the dominion of the Franks, and was submitted to in many parts of Italy and Germany. The earliest collection of the capitularies is that of Ansgise, abbot of Fontenelles. It was adopted by Louis the Debonnaire and Charles the Bald, and was publicly approved of in many councils of France and Germany. But as Ansgise had omitted many capitularies in his collection, Benedict, the Levite or deacon of the church of Mentz, added three books to them. Each of the collections was considered to be authentic, and of course was appealed to as law. Subsequent additions have been made to them. The best editions of them are those of Baluze (two volumes, Paris 1677), and of Pertz in the 'Monumenta Germaniæ Historica' (2d div. Vols. I. and II.; Hanover 1835-7). The capitularies remained in force in Italy longer than in Germany, and in France longer than in Italy. The incursions of the Normans, the intestine confusion and weakness of the government under the successors of Charlemagne, and above all the publication of the epitome of canon law termed the Decretum of Gratian, about the year 1150, which totally superseded them in all religious concerns, put an end to their authority in France.

Capitulation ("a writing drawn up in heads"), in military language, the act of surrendering to an enemy upon stipulated terms, in opposition to a surrender at discretion.

In the 15th century capitulations, as they were called, were presented by the ecclesiastical establishments in Germany to their newly chosen abbots and bishops, who were obliged to swear to observe them as laws and conditions for their future rule. The ecclesiastical Electors obtained, after the fall of the Hohenstaufen family, certain advantageous promises from the new emperors, which were called capitulations. When Charles V. was proposed as emperor, and it was apprehended, on account of his foreign education, that he would disregard the German constitution, he was obliged to make oath that he would not reside without the German empire, nor appoint foreigners to office in the empire, etc. This was called his "election capitulation." Such a *Wahlcapitulation* was afterward presented to every new emperor as a fun-

damental law of the empire. In this way the authority of the German emperors was constantly more and more diminished, so that at last it became merely nominal, since the electors, at the choice of every new emperor, made some new infringement on the imperial privileges. The *Wahlcapitulationen* were acknowledged bargains, certainly unique in history.

Capiz, *kä pēth'*, Philippines, capital of the province of Capiz, situated in the northern part of the island of Panay, four miles from the mouth of the Panay or Capiz River. The river is navigable to the city, and there is also an excellent roadstead at its mouth. There is a large local trade, particularly in rice, and connection by steamer with Manila. Capiz is also a telegraph and military station. Pop. 13,676.

Cap'lin, or **Capelin**, a small savory smelt (*Mallotus villosus*), found in large numbers on the Arctic coast as far south as Cape Cod. The inhabitants of Newfoundland and Labrador catch it in large quantities at certain seasons, and many are dried and exported to Great Britain.

Capmany y Montpalau, **Antonio de**, *àn-tò'-nē-ō dā kap mā nē ē mōnt-pa-lan'*, Spanish critic and historian: b. Barcelona, 24 Nov. 1742; d. Cadiz, 14 Nov. 1813. He served in the wars with Portugal in 1762, left the army in 1770, and joined Olavide in his scheme for colonizing and cultivating the Sierra Morena. This enterprise terminated disastrously, and Capmany removed to Madrid, where he was chosen secretary of the Royal Historical Academy of Spain in 1790, and filled several offices in the gift of the government. He traveled in Italy, Germany, France, and England. When the French entered Madrid in 1808, he fled to Seville, arriving there destitute and in rags. He was chosen a member of the Cortes of Cadiz, in which capacity he made himself conspicuous by his patriotism and active opposition to the new rulers. His works, which enjoy a high reputation in Spain, are numerous; among them are 'Memorias historicas sobre la Marina, Comercio y Artes de la antiqua Ciudad de Barcelona'; 'Questiones criticas sobre varios puntos de historia, economica, politica y militar'; 'Teatro historico-critico de la Elocuencia Española'; and 'Diccionario Frances-Español.'

Cap'nomancy, divination by smoke, one of the modes of divination resorted to by the ancients. They used to burn vervain or some other sacred plant, and observe the form and direction which the smoke took in escaping, and from these circumstances they drew their auguries. Sometimes the smoke of sacrifices was observed instead of that of vervain. When this smoke was thin and transparent, it was considered a good omen; if, on the contrary, it was thick and opaque, the omen was bad. Another method of acquiring a knowledge of the future by capnomancy was to throw the seeds of jasmine or poppy on burning coals, and to observe the smoke which rose from them.

Capo d'Istria, Austria (the ancient *ÆGDA*, later *JUSTINOPOLIS*), a seaport on the Gulf of Trieste, nine miles south of Trieste. It is connected with the mainland by a causeway rather more than half a mile long. It is defended by an old fort now going to decay. It contains a cathedral, a lofty edifice, faced in the Venetian

CAPO D'ISTRIAS — CAPPON

style with marble, and containing some fine paintings, sculptures, and arabesques. It is the seat of a bishop, and has six monasteries and two nunneries, a gymnasium, several hospitals, and a penitentiary. There are manufactories of soap, candles, leather, and sea-salt; and there is also a considerable trade in wines, oil, and fish. After the 10th century Capo d'Istria belonged, alternately, to the Venetians and Genoese, till finally, in 1478, it succeeded in making itself independent of the latter with the aid of the former. Capo d'Istria now became the capital of Istria, and along with it came into the possession of Austria in 1815. Pop. (1903) about 12,000.

Capo d'Istrias, or Capo d'Istria, Ioannes Antonios, yō-ān'nēs ān-tō'nyōs kă-pō-dēs'-trē-as, COUNT, Greek statesman: b. Corfu, 11 Feb. 1776; d. Nauplia, 9 Oct. 1831. His family had been settled in Corfu since 1373, but originally came from the Illyrian town of Capo d'Istria. He devoted himself to political life, and in 1809, after holding a high place in the Ionian Islands, entered the diplomatic service of Russia. Here his policy tended to the separation of Greece from Turkey. In 1828 he entered on a seven years' presidency of Greece; but whether from his attachment to Russian interests, or from the jealousy and impatience of restraint of the chiefs, he speedily became extremely unpopular. Several of these unruly chiefs belonging to the islands and to the province of Maina at last, in the spring of 1831, rose in open rebellion against him, demanding a convocation of the national assembly, the establishment of the liberty of the press, and the release of certain state prisoners, especially of Petros Mauromichalis, one of their own number whom D'Istrias had arrested and imprisoned. The president obtained the aid of Russia, but before the insurrection could be quelled he was assassinated in a church at Nauplia, by Constantine and George Mauromichalis, the brother and nephew of Petros Mauromichalis.

Caponnière, kă-pō-nyār, or **Caponnière**, in fortification, a place covered against the fire of the enemy on the sides, sometimes also above, and serving for the connection of two works or for maintaining an important point. In particular:

1. A passage secured by two parapets, in the form of glacis, which leads through the dry ditch from one work to another; for instance, from the chief wall to the ravelin. If danger is to be apprehended only from one side, and consequently only one parapet is made, it is called a demi-caponnière; if it is covered above with hurdles or with wood, it is called a coffer: but this word is often used indifferently for caponnière.

2. Small block-houses in the covered way, for its defense. Coehorn laid out similar but less useful works below the glacis, and Scharnhorst proposes them, under the name of field-caponnières, for the salient angles of field fortification.

Capote, Domingo Mendez, dō-mēng'gō mēn-dāth' kă-pō'tā, Cuban statesman: b. Cardenas, 1863. He was graduated at the University of Havana, and became one of the best-known lawyers in Cuba. Subsequently he was a professor in the University of Havana for many years. In December 1895 he joined the

insurgents under Gen. Maximo Gomez; became a brigadier-general; and was appointed civil governor of Matanzas and of Las Villas. In November 1897 he was elected vice-president of the Cuban republic. When the Cuban Constitutional Convention appointed a commission of five members to confer with President McKinley and Secretary Root concerning the future relations of the United States and Cuba, he became its leader. The conference was held in Washington, D. C., in April 1901.

Capoul, Joseph Amédée Victor, zhō-zēf a-mā-dā vĕk-tōr ka-pool, French tenor singer: b. Toulouse, 27 Feb. 1839. He was educated at Paris; and sang there in the Opéra Comique, 1861-72, where he was very popular, especially in his role as Gaston de Meillagré in Auber's 'Premier Jour de Bonheur.' He has also sung in New York, London, Vienna, St. Petersburg, and other cities, being everywhere very successful.

Cappadocia, kăp-pă-dō'shī-a, in antiquity, one of the most important provinces in Asia, once a famous kingdom; in its widest extent bounded west by Lycaonia, south by Cilicia and Syria, east by Armenia, and north by the Pontus Euxinus. In the period of the Persian government Cappadocia comprehended all the country between the Halys and Euphrates. By the former river it was separated from Phrygia and Paphlagonia; by the latter, from Armenia: therefore the region afterward called Pontus was comprehended in this territory. The Persians divided it, according to Strabo, into two satrapies, which bore the name of Cappadocia Magna, afterward Cappadocia Proper; and Cappadocia Minor, afterward Pontus. This division, however, was not always strictly observed. The Persian satraps governed, at a later time, under the title of kings, and sometimes made themselves independent. At the time of the famous retreat of the 10,000 Greeks, both the Cappadocias seem to have been under the rule of Mithridates, who had participated in the conspiracy of Cyrus the Younger, but retained his government and became, after the defeat of Cyrus, again dependent upon the kings of Persia. Cappadocia Magna was a good grazing country, and also well adapted for the cultivation of grain, especially wheat; but wood was scarce. Mazaca, afterward Cæsarea, now Kaisariyeh, was the residence of the kings of Cappadocia. The name of Leukosyri (White Syrians) is said by Strabo to have been applied to the Cappadocians, as if to distinguish them from the dark Syrians who dwelt to the east of Mount Amanus.

Cappel, kă'pĕl, Switzerland, a village in the canton of Zurich, and 10 miles from the town of Zurich. It contains an old Cistercian convent, founded in 1185, and a simple monument erected in 1838 to the reformer Zwingle, who was killed, 11 Oct. 1531, in a contest which took place near Cappel.

Cap'pon, James, Canadian educator: b. Scotland, 8 March 1854. He was educated at Glasgow University, and since 1888 has been professor of English language and literature at Queen's University, Kingston, Ontario. He has published 'Victor Hugo: a Study and a Memoir'; 'Britain's Title in South Africa.'

Capponi, Gino, MARCHESE, gē'nō mār-kā'zē kâp pō'nē, Italian scholar and historian: b. Florence, 14 Sept. 1792; d. there, 3 Feb. 1876. He traveled widely and devoted himself almost entirely to his studies in spite of the fact that he became blind early in life. For a short time in 1848 he was at the head of the Tuscan government; in 1859 he was a member of the Constitutional Convention of Tuscany; he was also made a senator of Italy; and in 1862 was at the head of the Historical Commission for Tuscany, Umbria, and the Marches. He wrote 'Storia della Repubblica di Firenze' (1875); and had a part in the preparation of a lexicon by the Accademia della Crusca, and in the editing of texts of Dante's 'Divine Comedy.'

Capps, Edward, American philologist: b. 21 Dec. 1866. He was graduated from Illinois College, 1887; took his doctor's degree at Yale, 1891; and was tutor in Latin at the latter place, 1890-2. Since then he has been successively associate professor and professor of Greek in the University of Chicago. Besides a number of philological papers, he has written 'From Homer to Theocritus' (1891).

Caprara, Giambattista, jām-bāt-tēs'ta ka-prā'ra, CARDINAL, Italian ecclesiastic: b. Bologna, Italy, 29 May 1733; d. Paris, 21 June 1810. He studied theology, became vice-legat of Ravenna in 1758 under Benedict XIV., and in 1785 was sent by Pius VI., as nuncio to Vienna, to remonstrate with the Emperor Joseph on his conduct in relation to Church matters. His remonstrance proved ineffectual, but in 1792 he was appointed a cardinal, shortly afterward a member of the state council, and in 1800 bishop of Jesi. In 1801 he went to Paris as legate of Pius VII., and conducted the negotiations with the French republic with so much success that in 1802 the first concordate was concluded. Shortly after he was appointed archbishop of Milan, and in 1805 he crowned Napoleon king of Italy.

Caprera, kā-prā'ra, a small island in the northeast of Sardinia, and separated from it by a narrow strait. It is six miles long from north to south, and two miles broad. It is fertile, and produces both corn and good pasture. It is well known as the ordinary residence of Garibaldi, who since 1854 possessed a dwelling-house on the island, along with a piece of ground which he farmed until his death here in 1882.

Capri, kā'prē, an island in the beautiful Gulf of Naples, which contributes not a little to the charms of this favorite scene of nature. Capri, five miles long and two broad, lies at the entrance of the gulf, and consists of two mountains of limestone, remarkable for their picturesque shape, and a well-cultivated valley. The inhabitants, amounting to 4,600, are occupied in the production of oil and wine, in fishing, and in catching quails, which come in immense numbers from Africa to the shores of Italy. Every spot on the island which can be made productive is cultivated. In fact, agriculture all around Naples is in the highest state of perfection. The town of Capri is the seat of a bishop, to whom all the quails belong. A high rock separates Capri from the little town of Anacapri, which is reached by 522 steps cut in the rock. With the Romans Capri was called Capræ. Augustus obtained it from the Neapolitans in exchange for Ischia, and made it a

place of agreeable retreat, but never made use of it. Tiberius spent here the last seven years of his life in degrading voluptuousness and infamous cruelty. The ruins of his palaces are still extant, and other ruins are scattered over the island. The island of Capri is remarkable for several remarkable caverns or grottoes in its steep, rocky coast. By far the most remarkable of these is unquestionably the celebrated Grotta azzurra (Blue Grotto), which was discovered by a singular accident in the summer of 1832, an Englishman while bathing having observed the opening in the rocks which forms the entrance to the grotto, and swum into it. It gets its name from the fact that, while the sun is shining outside, all the objects within the cavern — rocks, water, and sand — are tinged with a beautiful blue color, very soft and agreeable to the eye. The cavern is elliptical in form, measuring about 1,200 or 1,300 feet in circumference; its height is considerable, and its roof and sides bristle with stalactites. The blue color within the grotto is supposed to be caused by the refraction of the rays of light in passing through the water before entering the cave. The blue rays, with those next to them, the violet and the indigo, being the most refrangible, are the only rays that are admitted, the others — red, orange, etc., being dispersed in the water. In another part of the coast there is another grotto which exhibits phenomena precisely similar, except that the objects in this one are clothed with a green instead of a blue color. It is hence called the Grotta verde (Green Grotto).

Cap'ric Acid. See DECOIC ACID.

Capriccio, kā-prē'chō (*Caprice*), is the name applied to a musical composition, in which the composer follows the bent of his humor. The *capriccio* may be used with propriety in pieces for exercise, in which the strangest and most difficult figures may be introduced, if they are not at variance with the nature of the instrument or of the voice.

Capricornus (Lat. *capr.* "a goat," and *cornu*, "a horn"), "the goat." One of the 12 signs of the Zodiac, between Sagittarius and Aquarius; also the corresponding zodiacal constellation, one of Ptolemy's original 48. One of its brightest stars, Alpha, is a wide double, easily separated by the naked eye by any one with good eyesight. Capricornus is surrounded by Aquila, Aquarius, Piscis Austrinus, Microscopium, and Sagittarius.

Caprification, kāp-rī-fī-kā'shōn, the fertilization of the flowers of the Smyrna fig with pollen derived from the wild fig, or caprifig. From time immemorial it has been the custom of Orientals to break off the fruits of the caprifig, bring them to the edible-fig trees, and tie them to the limbs. From the caprifigs thus brought in there issues a minute insect, which, covered with pollen, crawls into the flower receptacles of the edible fig, fertilizes them, and thus produces a crop of seeds and brings about the subsequent ripening of the fruit. It has been shown that the varieties of the wild fig or caprifig are the only ones which contain male organs, while the varieties of the Smyrna fig are exclusively female. In the caprifig there are said to exist in Mediterranean regions three crops of fruit, — the spring crop, a summer crop, and a

third, which remains upon the trees through the winter. The fig-insect (*Blastophaga grossorum*) over-winters in the third crop, oviposits in the spring crop, develops a generation within it, each individual living in the swelling of a gall-flower (a modified and infertile female flower), and, issuing from it covered with pollen, enters the young flower receptacles of the young Smyrna fig, which are at that time of the proper size, and makes an attempt to oviposit in the true female flowers, fertilizing them at the same time by means of the pollen adhering to their bodies. The life history of the insect from that time on is not well understood, but the *Blastophaga* has been known to occur again in the over-wintering crop of figs. The effect of caprifcation on the young Smyrna figs becomes readily visible within a few days; before the *Blastophaga* enters the fig the latter is transverse and strongly ribbed, while a few days after fertilization the fig swells up and becomes rounded and sleek. The male *Blastophaga* is always wingless. It has no ocelli, and its compound eyes are greatly reduced in size. The fact that the male rarely leaves the fig in which it has hatched might almost be inferred from these facts of winglessness and partial blindness. When this wingless male issues from the seed-like gall in which it is contained, it seeks a female gall in the interior of the same fig, gnaws a small hole through its cortex, inserts its extremely long, almost telescopic, abdominal extremity through the hole, and fertilizes the female. The female subsequently, with her powerful jaws, gnaws the top of the gall off and emerges, crawling around the interior of the fig, and eventually forcing her way through the ostium, almost immediately seeking for young figs, which she enters, and, should the fig entered prove to be a caprifig, lays her eggs at the base of as many flowers as she can find, and then dies. Should the fig entered, however, be a Smyrna fig, either through the fact of the caprifig from which she issued having been hung in the branches of a Smyrna-fig tree, or from the fact that she has flown to an adjoining Smyrna-fig tree, she walks around among the female flowers seeking for a proper place to oviposit. It is this futile, wandering search, when her body is covered with pollen from the caprifigs, that produces the extensive and almost perfect fertilization of the entire number of female flowers. The young larva is a delicate little maggot curved upon itself and showing no visible segmentation. In the full-grown larva the segments are more apparent, and with the growth of the larva the gall at the base of the male florets becomes hard, and greatly resembles a seed, turning light brown in color. The male and the female pupa each occupies a greater portion of the interior of the gall. Consult: 'The Fig' (United States Department of Agriculture, Washington 1901).

Although figs are raised in California and the southern States they have long been inferior to the Smyrna fig, the standard kind of commerce, which owes its peculiar flavor to the number of ripe seeds which it contains. These seeds are obtained only by the process described above, and the United States Department of Agriculture has recently devoted much attention to caprifcation, with a view to the development of the American fig industry.

Caprimulgidæ, kăp-rî-mŭl'jî-dē, the goat-suckers (so called from a superstition regarding their habits), a family of birds of puzzling affinities, but nearest to the swifts (*Cypselidæ*), with which, and the humming-birds, they are often considered to constitute an order, *Macrochures*. The family is characterized by a small bill, enormous gape fringed with elongated, stiff bristles, elongated tail of 10 soft rectrices, long pointed wings, very small feet with the middle claw pectinate, and very lax plumage. Two subfamilies, the *Caprimulgina* or true goatsuckers, and the *Nyctibina* of tropical America, are recognized, to which the oil-birds (*Steatornis*), and *Podargus* and its allies, are sometimes added as two more. The family is nearly cosmopolitan, and comprises 12 or 15 genera and perhaps 100 species, all birds of more or less crepuscular habits, which catch insects on the wing like swallows. The "night-hawk" and "whip-poor-will" are the common species of the eastern United States.

Caprivi, Georg Leo, gā ōrg lâ ō kă-prē'vê, GRAF VON, sometimes called CAPRIVI DE CAPRARA DE MONTECUCULI, German soldier and statesman: b. Charlottenburg, 24 Feb. 1831; d. Skjren, 6 Feb. 1899. He entered the army in 1849; fought in the campaigns of 1864 and 1866; and in the Franco-German war of 1870 was chief of staff to the 10th Army Corps. In 1883-8 he was at the head of the Admiralty; in 1888 he became commander of his old army corps. Hence he was removed, on the fall of Bismarck, in 1890, to become imperial chancellor and Prussian prime minister. His principal measures were the army bills of 1892 and 1893, and the commercial treaty with Russia in 1894, in which year he retired.

Capro'ic Acid. See HEXOIC ACID.

Capron, Allyn, American soldier: b. Tampa, Fla., 27 Aug. 1846; d. Fort Myer, Va., 18 Sept. 1898. He was graduated at West Point, 1867, and entered the 1st Artillery, receiving his captaincy 4 Dec. 1888. During the Sioux campaign of 1890 he made a brilliant record at the battles of Wounded Knee and Drexel Mission. During the war with Spain, 1898, he opened the fight at El Caney, Cuba, and shattered the first flagstaff in Santiago. During this campaign he was taken ill with typhoid fever, and succumbed to its attack. He was a fine mathematician, and a recognized authority on artillery and tactics. His father, Erastus Allyn Capron was killed at Churubusco, in the Mexican war, 20 Aug. 1847.

Ca'pron, Allen Kissam, American military officer (son of Allyn Capron, q.v.): b. Brooklyn, N. Y., 24 June 1871; d. Las Guasimas, Cuba, 24 June 1898. He enlisted as a private (1890), and rose to a second lieutenantcy (1893), joining the "Rough Riders" on the outbreak of the war with Spain. He was made a captain for bravery, and was the first American army officer who fell in that war.

Capryl'ic Acid. See OCTOIC ACID.

Cap'sicin, kăp'sî-sîn, a name given to two apparently different substances. One described by Braconnot, obtained from chilli pepper, is an acrid oil or oleoresin, of a reddish-brown color, the vapor of which excites sneezing and coughing. It is probably a mixture of different bodies. The other is a resinoid substance ob-

CAPSICUM—CAPTAIN

tained from cayenne pepper; it is brown with a golden tint, has the consistence of tar, an aromatic smell and pungent taste, and is used in America as a powerful stimulant in influenza, fever, indigestion, and other disorders, and externally as a rubefacient. Quite recently a volatile alkaloid has been obtained from chilli pepper, by first removing the acrid resin, then making the fluid alkaline, and extracting with petroleum spirit. On evaporating, a substance is produced with an odor like that of conia. It is distinguished from conia and nicotine by a variety of reactions.

Capsicum, a genus of plants of the order *Solanaceæ*, consisting of annual or biennial plants, bearing membranous pods containing several seeds, noted for their hot, pungent qualities. *C. annuum*, a native of South America, furnishes the fruits known as chillies. These, as well as the fruits of *C. frutescens* and other species, are used to form cayenne pepper. For this purpose the ripe fruits are dried in the sun or in an oven, and then ground to powder, which is mixed with a large quantity of wheat flour. The mixed powder is then turned into cakes with leaven; these are baked till they become as hard as biscuit, and are then ground and sifted. Cayenne pepper is largely adulterated with red lead and other substances. *C. fructus* is the dried ripe fruit of *C. fastigiatum*, imported from Zanzibar. It is a small, oblong, scarlet, membranous pod, divided internally into two or three cells containing numerous flat, white, reniform seeds. It has no odor; its taste is hot and acrid. Capsicum fruits are used medicinally, in powder or as a tincture, externally, or as a gargle in cases of malignant sore throat, and internally as a stimulant in cases of impaired digestion.

By reason of the resin-like body, capscin, which is contained in the fruits of these plants, they possess very active irritant properties. The pure crystals of capscin are extremely virulent, and readily cause severe poisoning; but the ground fruit is less active, and is of service in medicine, both for external and internal medication.

Externally, capsicum is used as an irritant to cause redness of the skin or to blister, thus affecting related visceral areas within the body. It is thus employed in bronchitis, in early stages of pneumonia, in pleurisies, and in joint and nerve affections. Internally, capsicum is used to stimulate the appetite and to increase the amounts of gastric and intestinal juices. It is particularly serviceable in the gastritis of alcoholism. All capsicum should be excluded from the diet of patients with disease of the kidneys or acute disease of the genito-urinary system.

Cap'stan (Fr. *cabestan*, probably from a derivative of Lat. *capistrum*, a halter, from *capere*, to hold), an apparatus constructed on the mechanical principle of the wheel and axle, used for moving heavy weights and by various methods for the application of power. Its axis, unlike that of the windlass, is vertical. The capstan may be operated either by steam-power or by means of a lever set in its socket and worked by horses or pushed by hand, the last method usually requiring several men. When used elsewhere than on shipboard, the capstan generally has some specific name. Thus, when employed for raising coal from pits it is com-

monly called a gin; if worked by horses, it is known as a whim-gin. Capstans were formerly made of wood, but are at present almost universally of iron. The upright barrel of a capstan is constructed around a spindle. The barrel is sometimes smooth, and sometimes for increase of friction has, running up and down its surface, ribs or ridges called whelps. In the capstan-head or drum-head, surmounting the barrel, are holes for the levers or capstan-bars used to revolve the barrel. Being smaller at its centre than at the top or bottom end, the barrel has a curve from above and below, whereby a rope wound by working the capstan slips toward the concave part so formed. By this device a length of rope may be compactly and securely wound and kept in place for repeated use. On the circumference of a pawl-head at the bottom of the barrel are pivoted pawls which catch a pawl-rim or ratchet-ring fastened to the platform or floor on which the capstan is fixed. There are various other devices for increasing friction, the prevention of slipping, and reverse operation of the mechanism.

Cap'sule, in botany, a dry fruit containing several seeds, sometimes a large number, and opening of itself by means of valves or pores when it comes to maturity. According as it contains one, two, three, or more cells, the capsule is called unilocular, biocular, trilocular, etc., and when it has many cells it is called multilocular.

In anatomy a capsule is a mass of fibrous, connective tissue cells surrounding or supporting an organ, either as a bag, as is the case in the kidneys; or as a framework, as in the liver. The capsule is usually an integral portion of the structure of an organ.

In pharmacy gelatin capsules are widely used for purposes of rendering medicines tasteless.

Captain. This is one of those many words derived from the Latin of the Middle Ages, and now to be found in all the different idioms of Europe. Captain comes from the Latin *capitaneus*, from *caput*, head, and signified, first, a governor of a province, who in the first half of the Middle Ages was generally a military man. Thus the word captain soon came to be used chiefly to denote a high, or rather the highest military officer. Like many other words, however, this has in the course of time lost much of its dignity, and in military technology now signifies the commander of a small body, a company, and in maritime language the master of a vessel. In the navy it indicates a specific rank, the captain being distinctively the officer commanding a war-vessel. In the latter part of the Middle Ages, when armies were not yet so regularly divided and subdivided as at the present time, captains were the commanders of those small bodies of which the armies consisted. These were generally collected by their commander, who entered with his company into the service where most pay or most booty could be obtained. The practice of carrying war by troops collected in this manner prevailed to the greatest extent in Italy, where the continual quarrels of the numerous small states afforded ample employment to the unsettled and the disolute. These companies play an important part in the history of the Middle Ages, particularly that of the two centuries preceding the Reformation, and had a very important influence on

CAPTION — CAPUCHINS

the manners and morals of the south of Europe. They are further interesting to the student of history, because they are so unlike anything at present existing.

CAPTAIN, in modern armies, is the commander of a company of foot or a troop of horse. In the United States army he nominates the sergeants, corporals, and lance-corporals of his company, who are appointed by the commander of the regiment.

CAPTAIN, in the navy, an officer commanding a ship of war. The naval captain is next in rank above the commander, and in the United States ranks with a colonel in the army.

CAPTAIN-GENERAL, the commander-in-chief of an army or of all the military forces of a country. In France it was an ancient title which conferred an almost unlimited power on the person who possessed it in the district where he commanded. But it never corresponded to that of *generalissimo* except in the case of the Duke of Savoy, in 1635, in the time of Louis XIII. The title is not in use at present, nor would it agree with the existing organization of the administration. In Spain the rank of a captain-general corresponds with that of a marshal of France, the captain-general having command of an army or army-corps. The title was also given to the head of a province in the Spanish colonies in South America, which were divided into viceroalties and captain-generalships (*capitanías-generales*); thus Chile used to be a captain-generalship. The captains-general were not placed under the viceroys, but accountable only to the king through the council of the Indies. The captain-general of Venezuela, for instance, had no connection with the viceroy of New Granada. They decided, in the last instance, on all legislative, judicial, and military affairs, and presided in the *real audiencia*. The time during which these governors remained in power was limited to a few years, probably in order to prevent them from becoming too powerful. The consequence was, that the colonies were oppressed the more to enrich the governors, for rich every one was when he left his office.

CAPTAIN of a merchant ship, he who has the direction of a ship, her crew, lading, etc. In small vessels he is more ordinarily called master, which indeed is the correct title.

Caption, in law, signifies that part of a legal instrument such as an indictment or commission, which states when, where, and by what authority it is executed. In Scotch law it signifies a warrant of imprisonment issued against a party to enforce an obligation, being now confined to a warrant served upon a party who has illegally retained papers in a lawsuit that had been borrowed by him, and intended to compel the return of the papers.

Capua, *kā'poo ā*, Italy, a city in the province of Caserta, 18 miles north of Naples, on the Volturno, which is crossed by a handsome bridge. The district is very fertile, but somewhat unhealthy. It is the seat of an archbishopric, and is the principal fortress that covers the approach to Naples. It has two magnificent gates, three principal streets, two handsome squares, and three public fountains. The town is dirty and badly built. The principal public buildings are the cathedral, with a cupola supported by 18 columns, entirely modernized;

the church of the Annunciation; the governor's palace, the town-hall, a museum with many ancient works of art, etc. The ancient city was situated two and a half miles southeast from the modern town, which was built from its ruins on the site of the ancient Casilinum by the Lombards in the 9th century. The site is now occupied by a considerable town, called Santa-Maria-di-Capoa-Vetere. The ancient Capua, one of the finest and most agreeable cities of Italy, was of such extent as to be compared to Rome and Carthage. Hannibal wintered at ancient Capua after the battle of Cannæ, and thus not only lost time, but also is commonly said to have rendered his army unfit to follow up the advantage he had gained. It was a favorite place of resort of the Romans, on account of its agreeable situation and its healthy climate; and many existing ruins attest its ancient splendor. In 456 A.D. it was devastated by the Vandals under Genseric, and in 840 the Saracens completely destroyed it. Pop. about 14,000.

Capuana, Luigi, *loo-ē'jē kā-poo-ā'nā*, Italian poet, novelist, and critic: b. Mineo, Sicily, 27 May 1839. Having devoted himself to journalism, he settled in Florence in 1864, where he wrote dramatic criticisms; from 1868 until 1877 he lived in his native town, then in Milan, again as a journalist. His best-known work is 'Giacinta' (1879), a naturalistic novel. Besides this he has published several volumes of short stories, among them: 'Profiles of Women' (1881); 'Homo' (1883); and two collections of charming fairy tales: 'Once upon a Time' (1882) and 'Fairy Land' (1883). A curious specimen of rhythmical prose is his 'Semi-Rhythms' (1888), in praise of worldly joy and beauty.

Capuchin, *kăp ū shēn* or *kap ū chēn*, the name of several animals in which the growth of the hair or feathers upon the head forms a sort of hood suggesting that of a Capuchin friar. Certain monkeys are so called, especially the South American sapajous (q.v.) and one or more of the macaques (q.v.). A breed of domestic pigeons is also so called.

Capuchins, an order of mendicant friars in the Roman Catholic Church founded in 1528 in virtue of a bull of Clement VII. Its founder, Matteo Barro, was a member of the rigorist section of the Observantine Franciscans, who sought to restore the rule of perfect poverty and humility, and to be of aid to parish priests in the cure of souls. The Capuchin friars obtained their name from the capucce, cowl, or hood which they wore. They were vowed to live according to the rule of St. Francis in hermitages and to labor for the conversion of notorious sinners. Their churches were to be bare of ornament. Soon after their foundation they did heroic service in ministering to those stricken by the plague which at that time ravaged all Italy. The third vicar-general of the order, Bernardino Ochino (q.v.) brought the Capuchins into discredit by his notorious leanings toward protestantism, and the fraternity was interdicted from preaching by Paul III., and would have been suppressed had not Cardinal Sanseverino, archbishop of Naples, interceded for them. Paul also forbade them to establish any convents beyond the Alps, but his successor, Gregory XIII., revoked that decree. Again, Gregory XIV. in 1591 withdrew from them the fac-

CAPULETS AND MONTAGUES—CARACAS

ulty of ministering in the confessional; but it was restored to them 10 years later by Clement VIII. Finally, in 1619 the fraternity was restored to good standing, and was even erected into an order administratively independent of the general of the Franciscans, and their vicar-general assumed the style of minister-general. Ever since, the Capuchins have been recognized as eminently useful servants of the Church. The order conducts missions in all quarters of the globe, and has the reputation of being very successful in winning converts.

Cap'ulets and Mon'tagues, the English spelling of the names of the Cappelletti and Montecchi, two noble families of northern Italy, according to tradition of Verona, chiefly memorable from their connection with the legend on which Shakespeare has founded his tragedy of 'Romeo and Juliet.'

Ca'put Mor'tuum (Latin), literally, a dead head; a fanciful term much used by the old chemists to denote the residuum of chemicals when all their volatile matters had escaped; hence the word is figuratively used of anything from which all that rendered it valuable has been taken away.

Caputiati, kă-pū-shī-ă'tī, a Christian sect which arose in France in the 12th century. They wore on their heads a leaden image of the virgin Mary. They wished liberty, equality, and the abolition of all civil government. Hugo, bishop of Auxerre, suppressed them by military force.

Capybara, kă-pē-bă'ra, an aquatic rodent (*Hydrochoerus capybara*), of the family *Caviidae*, native to South America. It is the largest rodent known, being four feet long, and weighing nearly 100 pounds. It has a rough brown coat, a heavy flat head, small, pig-like eyes and ears, and a blunt muzzle. Its feet are supplied with hoof-like claws, and its tail, unlike that of most rodents, is very short. The animal is herbivorous, browsing on grass along river banks, and often creating havoc in sugar plantations. It is awkward on land, but swims and dives well, and can remain under water a long time. The flesh is edible, except that of very old males.

Carabao, kă-ră-bă'ō. See BUFFALO.

Car'abas, Marquis of, the exalted personage who figures in Perrault's story of 'La Chat Botté' ('Puss in Boots'). The name is often applied to an extremely conservative aristocrat. In Disraeli's 'Vivian Grey' the Marquis of Clanricarde is satirized as the Marquis of Carabas.

Carabidae, the family of *Coleoptera*, comprising the ground-beetles. In form the species vary greatly; the antennæ are inserted behind the base of the mandibles under a frontal ridge; maxillæ with the outer lobe palpiiform, usually biarticulate, while the inner lobe is usually curved, acute, and ciliate, with spines. The epimera and episterna of the prothorax are usually distinct; the three anterior segments of the abdomen, usually six, rarely seven or eight in number, are connate. The legs are slender, formed for running; anterior and middle coxæ globular, posterior ones dilated internally, and the tarsi are five-jointed. They are, with few exceptions, predaceous and carnivorous beetles; they are runners, and do not fly, the hind wings

being often absent. Their colors are dull metallic or black. They run in grass, or lurk under stones or the bark of trees, whence they go out to hunt in the night-time. The larvæ are found in much the same situations as the adult beetles, and are generally oblong, broad, with the terminal ring around, with two horny hooks or longer filaments, and with a single false leg beneath. *Carabus serratus* and *Calosoma calidum* are common examples.

Car'abine, or Carbine. See RIFLE.

Carabobo, kă-ră-bō'bō, a state of Venezuela, bounded on the north by the Caribbean Sea; area, 2,984 square miles. The capital is Valencia, and the chief port Puerto Cabello. Coffee, cacao, and sugar are cultivated. The village of Carabobo, 20 miles southwest of Valencia, was the scene of the battle fought 24 June 1821, which was decisive of the independence of Colombia. Caracas, La Guayra, Carthagena, Cumana, and all that portion of Venezuela which is dependent upon them, were permanently secured to the patriots by this victory. Pop. (1900) 225,000.

Caracal, kăr'a kăl, a lynx-like wild cat of Africa and southern Asia, slender in form and usually red-brown in color. See LYNX.

Caracal'la, Roman emperor: b. Lyons, 188 A.D.; d. 217. His real name was MARCUS AURELIUS ANTONINUS BASSIANUS, and he was the eldest son of Septimius Severus. On the death of his father he succeeded to the throne with his brother, Antoninus Geta, whom he speedily murdered. To effect his own security upward of 20,000 other victims were butchered. He was himself assassinated by Macrinus, the pretorian prefect, near Edessa, in 217. Among the buildings of Caracalla in Rome, the baths—*Therma Caracallæ*—near Porta Capena, were most celebrated, and their ruins are still magnificent.

Caracara, kă-ra-kă'ra, a genus of large carrion-eating hawks of the tropical parts of America, with black and white plumage, the head somewhat crested, legs long and naked and the general aspect vulture-like. They have increased greatly with the spread of the cattle-raising industry in South America, and have proved of much service as scavengers about the ranches and villages. The species to which the name most strictly applies is *Polyborus cheriway*, which is found from Venezuela to Texas and southern California. Another prominent species is the carancho (*P. tharus*) numerous and well known all over Brazil and Argentina. Darwin gives interesting facts in regard to this and related vulture-hawks in his journal. Compare CHIMANGO.

Caracas, kă-ră-kās, city and capital of the United States of Venezuela, was founded in 1567 by Diego de Lozada, who called the city Santiago de León. But in popular usage a more distinctive name was adopted—that of the Caracas tribe of Indians, formerly inhabiting the valley in which the city is built. Its altitude being about 3,000 feet above sea-level, the climate is generally mild and agreeable, the temperature seldom rising above 82° F. (with 84.2 as a maximum), or falling below 65° F. (with a minimum of 48.2). Toward the end of December the temperature is lowest, and it is highest from June to September. Mean temperature, 66.2° F. Lat. 10° 32' N., lon. 67° 4' 45" W.

CARACCI — CARAFFA

The streets cross each other at right angles, running due east and west, or north and south, and the principal thoroughfares are paved with stone, and have sidewalks of cement. The capitol building occupies an entire square, an area of more than two acres. It includes the halls in which both chambers of the national congress hold their sessions. The rooms of the high federal court, and the departments of public instruction and the interior are in the galleries on the east and west sides of the capitol. *La Casa Amarilla* (the Yellow House), official residence of the president of the republic, is situated west of the Plaza Bolívar. On the north side of the same square is the main post-office. Near by are the archbishop's palace, the cathedral, and the municipal palace. Opposite the southern façade of the capitol are the university buildings (Gothic architecture, with interior gardens); the old temple of San Francisco, and the Exposition Palace, the western wing of which contains the Bolívar Museum, the headquarters of the Academy of History, and the corresponding branch of the Spanish Royal Academy. The national library and museum are housed by the university. Other characteristic buildings are: The National Pantheon, the Masonic Temple, the three markets, the National Benevolent Institute, the Arsenal, the Institute of Arts and Trades, and the Municipal Theatre. Besides the Plaza Bolívar, the principal public squares are the Washington, Pantheon, and Fifth of July (Independence Day). The cathedral, dating from 1614; the *Basilica de Santa Ana*, and the *Santa Capilla*, are noteworthy among the churches of the city. Interesting relics of the heroes of the struggle for liberty, Miranda, Bolívar, and Páez, are shown in the National Museum. There are several promenades (called "Iron Bridge," "Paradise Avenue," and "Independence"), and among the places of amusement are a Plaza de Toros, baseball grounds, and a bicycle park. An important institution supported by the government is the Vargas Hospital. The Linares Hospital for children is maintained by private contributions. Leading clubs are the Union, German, Italian, and Agricultural. Street railways are controlled by the Caracas and Bolívar companies. The city has cheap telephone service, furnished by two companies, and is lighted by gas and electricity. All telegraph lines throughout the republic are owned by the government. Four lines of railway start at Caracas, three of which are designed to place the capital in communication with the interior, while the most important runs to Port La Guayara. Pop. including the six suburban parishes making up the federal district is about 90,000.

Caracci. See CARRACCI.

Caraccioli, Francesco, frān chēs'kō kā-rā-chō'lō, Italian admiral: b. Naples, 1752; d. 29 June 1799. He was distinguished in the Neapolitan service, but entered the service of the Parthenopean Republic set up by the French republicans in 1799, and repelled a Sicilian-English fleet. When Ruffo took Naples, Caraccioli was arrested, and being tried by court-martial was condemned to death, and hanged at the yard-arm of a Neapolitan frigate. The court-martial was ordered by Nelson, to whom the king had given command of the Neapolitan navy.

Carac'tacus, British king. He was a son of Cunobelin, king of the Trinobantes, and in 43 A.D., when Plautius landed, was at the head of the Catuvellauni. Plautius and his lieutenant Vespasian, who afterward became emperor, defeated the British forces under Caractacus on several occasions, the chief battle probably taking place about Wallingford. When the Romans had pushed well down the Thames the Emperor Claudius arrived and took part in further military operations, but his stay was a very short one. Caractacus now established himself in South Wales among the Silures, whence he took every opportunity of harassing the Romans. In 47 A.D. Plautius was replaced by Ostorius Scapula, and that commander completely defeated Caractacus in a battle somewhere about Shropshire, probably at Caer Caradoc. The wife, daughter, and brothers of the British leader were captured, and Caractacus himself fled to the country of the Brigantes in the north, only to be delivered up by their queen Cartimandua into the hands of the Romans. He was taken to Rome and made to take part in a triumphal procession. Here he was led before the Emperor Claudius and an assembly of the people. When he came to the seat of the emperor he stopped and addressed him, and so won upon the monarch by his noble behavior and pathetic speech that the other pardoned him. According to the Welsh Triads he lived four years longer, and his children became Christians and introduced Christianity into Britain. He is introduced among the *dramatis personæ* of Beaumont and Fletcher's play, 'Bonduca.'

Caradoc Sandstone, the name given by Murchison to a thickness of about 4,500 feet of sandstones, shales, grits, flags, and sandy limestones on the border between England and Wales, which he made a separate series. Subsequent investigation has shown that the Caradoc series is of the same age as the Bala, and the series is sometimes called Bala and Caradoc by English geologists. The rocks are of the Ordovician system. See ORDOVICIAN.

Carafe, kā-raf', the French name for an ordinary glass bottle or decanter for holding drinking water.

Caraffa, kā-räffä, a celebrated Neapolitan family, which has produced several distinguished commanders and statesmen: 1. OLIVIERO, b. 1406; d. Rome, 1511. He was made a cardinal by Pope Paul II. in 1467. Sixtus IV. appointed him his legate to Alfonso of Naples, and in 1472 made him admiral of his fleet against the Turks, from whom he captured Smyrna, and the port of Satalia in Asia Minor. 2. CARLO, b. Naples, 1517; d. 1561. He served first in the Netherlands under the Spaniards, then entered the order of Malta, and was made a cardinal by his uncle Pope Paul IV., who, for his sake, stripped the Colonnas of their possessions. This involved them in a war with Philip of Spain, but the result proved favorable to the Caraffa family. Paul IV. was succeeded by Pius IV., who was a bitter enemy of the Caraffas, imprisoned them, and then caused the cardinal to be strangled. 3. ANTONIO, b. Naples, 1538; d. 1591. He was made cardinal by Pius V., and intrusted with the superintendence of the congregation for the revision of the Bible, and an Exposition of the Canons of the Council of Trent. Under Gregory XIII. he became libra-

CARAMBOLA — CARAVAGGIO DA POLIDORO

rian of the Vatican. He translated Theodoret's Commentaries on the Psalms, and the Orations of Gregory Nazianzen from Greek into Latin.

4. ANTONIO, another member of the family, distinguished himself in Hungary in the service of Austria, but made himself universally hated by his cruelty. D. Vienna, 1693.

Carambola, *kā-ram-bō'la*, the fruit of an East Indian tree of the same genus as the bilimbi, the *Averrhoa Carambola*, order *Oxalidaceae*. It is of the size and shape of a duck's egg, of an agreeable acidulous flavor.

Car'amel. When sugar is gradually heated, it loses water and other substances, and is converted into a dark mass with a characteristic smell and taste. This is crude caramel, which is used in cookery as a coloring and flavoring ingredient. It is a mixture of several bodies, of which three have been described: Caramelane, a brown bitter body, soluble in water; Caramelene, a dark brown body, also soluble in water, and possessed of great tinctorial power; and Caramelin, a black substance, of intense coloring power, which exists both in a soluble and insoluble modification.

Carangidae, *kā-rān'ji-dē*, a family of marine fishes, the pompanos. Among the more widely known members of the family are the leather jackets, pilot fishes, amber fishes, runners, horse mackerels, crevallés, moonfishes, and pompanos. There are about 200 species in the family, and nearly all are good for food. They abound in the warmer seas, and many of them are remarkable for their graceful or strange forms.

Car'apa, a small genus of tropical trees of the natural order *Meliaceae*, with mostly imparipinnate leaves and regular flowers. A South American species (*C. guianensis*) is a fine large tree, whose bark is in repute as a febrifuge. Oil made from its seeds (called carap-oil or crab-oil) is used for lamps, and masts of ships are made from its trunk. The wood is called crab-wood. The oil of the African species (*C. toluana*), called *coondi*, *kundah*, or *tallicoona* oil, is used by the negroes for making soap and anointing their bodies in order to protect them against insects. The oil of the South American carapa is used for the same purpose also.

Car'apace, the upper part of the hard shell or case in which reptiles belonging to the order of the *Chelonina* are enclosed, the lower part being called plastron. The same name is also given to the upper part of the shell of the Crustacea, and to the case inclosing certain of the *Infusoria*.

Car'at is said to have derived its name from *qirrāt*, which in Arabic signifies the pod of a leguminous plant, the seeds of which have, from time immemorial, been used in the East in weighing gold, because they never vary in weight when once dry. It is a weight of three and a sixth troy grains, used in weighing pearls and precious stones, and also serves to express the relative fineness of gold. Twenty-four carats being assumed as the standard of gold perfectly free from alloy, every specimen, in proportion as it falls short of this purity, has a fineness of less than 24 carats—for example, if the alloy amounts to a sixth of the whole, it is 20 carats fine; or to a fourth, it is 18 carats fine.

Carausius, *kā-rō'shī-ūs*, Roman general: b. among the Menapii, in Gallia Belgica. He was sent by the Emperor Maximian to defend the Atlantic coasts against the Franks and Saxons; but being suspected of permitting those pirates to commit their ravages in order to increase his own plunder when he afterward captured their vessels, and foreseeing that he was likely to fall into disgrace, he landed in Britain and had himself proclaimed emperor by his legions (287 A.D.). In this province he was able to maintain himself six years, when he was assassinated by one of his officers named Allectus (293 A.D.).

Caravaca, *kā-ṛa-vā'ka*, Spain, a town in the province of Murcia, and 43 miles west by north of the town of Murcia. It occupies the side of a hill crowned by an ancient castle, and overlooking the river Caravaca, here crossed by a stone bridge; is well built, and has a handsome town-house and church, the latter with a lofty tower and some good sculptures and paintings. Its trade is chiefly in cattle, grain, and manufactures of woolen and hempen goods, paper, soap, earthen and copper ware. Pop. 16,000.

Caravaggio, *da, Michelangelo Amerighi*, or *Merighi*, *mē'kēl ān'yō lō ā-mēr-ē'jē* or *mēr'ē jē kā rā vad'jō*, Italian painter: b. Caravaggio, in the Milanese, 1569; d. near Porto Ercole, 1609. He was at first a journeyman mason, but soon applied himself to the study of painting, studied in Milan and Venice, and afterward went to Rome, where he distinguished himself. He may be considered as the inventor of a manner which has had a crowd of imitators. His characteristic traits are vigor and truth of *chiaroscuro*, combined with excellent coloring. He was fond of introducing broad and deep masses of shade, whereby a great effect is given to the light. To aid him in producing this effect the room in which he worked was illuminated by a skylight, and the walls were painted black. He excelled in the painting of naked figures. His faults are obvious. Narrow and servile imitation of nature was his highest aim. Annibale Caracci and Domenichino were, perhaps, less distinguished than Caravaggio during their lives, but after their death were ranked higher; because, without neglecting coloring and the study of nature, they aimed at correctness of design and dignity of conception. His violent character involved him in many difficulties. He died in consequence of wounds received in a quarrel in which his violent nature had involved him. The painters who have imitated him most are Manfredi, Valentin, and Ribeira, called *Espagnolet*.

Caravaggio da Polidoro, Italian painter: b. Caravaggio, 1495; d. 1543. His real name was CALDARA, but he was surnamed CARAVAGGIO from his birthplace. He went to Rome in his youth and carried bricks at first for the masons who worked in the Vatican. He first felt a great desire to become a painter from seeing Giovanni da Udine and the other painters who were occupied in the Vatican. He formed a close friendship with Maturin of Florence, who assisted him with his advice. Caldara soon surpassed him, and exerted himself to introduce improvements in drawing, having always in view the antiques. Raphael employed him in the galleries of the Vatican, where he painted,

under his direction, several excellent friezes. At Messina he executed an oil-painting, representing Christ bearing the cross, which contains a number of beautiful figures, and proves his ability to treat the most elevated subjects. He has approached more than any one to the style and the manner of the ancients, particularly in imitating their bas-reliefs. His figures are correct, well distributed and arranged; the positions are natural, the heads full of expression and character. It is evident that he would have acquired great celebrity if he had undertaken greater works. He applied himself to the *chiaroscuro*, particularly to that kind of it which is called *sgraffiato*. He showed, also, much talent in his landscapes. At the sack of Rome in 1527 he fled to Naples, and on his return from that place to Rome, in 1543, he was murdered by his domestic.

Caravaggio, Italy, a town and commune in Lombardy, 24 miles east of Milan, on the Gera d'Adda. It is celebrated as the birthplace of the two great painters, Polidoro Caldara and Michelangelo Amerighi, both called *da Caravaggio*. It was formerly surrounded by walls and defended by a strong castle. Its principal church has some good paintings. The commune is famous for its melons. Pop. about 10,000.

Caravan, or **Karavan**, a Persian word, used to denote large companies which travel together in Asia and Africa for the sake of security from robbers, having in view, principally, trade or pilgrimages. Such a company often have more than 1,000 camels to carry their baggage and their goods. These walk in single file, and the line is often four or five miles long. To avoid the excessive heat, they travel mostly early in the morning. As every Mohammedan is supposed to visit the tomb of Mohammed once at least during his life, caravans of pilgrims go to Mecca every year from various places of meeting. Of the various caravans which proceed to Mecca every year, the most important has always been the Syrian. The place at which it meets is Damascus, and here the pilgrims and merchants assemble many weeks before the day of departure, which is always fixed according to the season of the year in which the feast of Bairam occurs, the pilgrims requiring to be at Mecca on the day of the feast. As these caravans serve mercantile as well as religious purposes, Mecca, on the arrival of the caravans, resembles a great fair, and this fair is indeed the most important in all the East. The journey from Damascus to Mecca and back occupies about four months. The leader of such a caravan to Mecca, who carries with him some cannon for protection, is called *Emir-el-Hadj* (Prince of the Pilgrims). Trading caravans choose one of their own number for a leader, whom they call Caravan Bashi. Much information on the subject of caravans is to be found in the travels of Niebuhr, who made many journeys with them, and describes them, as it is well known, minutely and faithfully.

Caravansari, *kā-ra-vān'sa-rī*, in the East, a sort of inn, situated in countries where there are no cities or villages for a considerable extent, to furnish travelers with a shelter. Some of them are built with much splendor, though they are generally unfurnished, and the traveler is obliged to bring with him not only his bed

and carpet, but also all his provisions and necessities. In many, the hospitality is gratuitous. It is common for a pious Mohammedan to establish, during his life or by will, one or several of such caravansaries. This kind of benevolence is considered peculiarly agreeable to the deity, and promotive of the eternal happiness of the founder. Sometimes persons are kept in these establishments to guide the caravans for some distance. See KHAN.

Car'avel, formerly the name of different kinds of vessels; one used in Portugal of 100 to 150 tons burden, another a French fishing vessel used on the coasts of Normandy and Picardy of 10 to 15 tons, and a third a large Turkish ship of war.

Carawala, *kā-ra-wā'la*, a large viper (*Hypnale ncpa*) of Ceylon and southern India, numerous, and greatly dreaded by the natives, especially those who work in the pineapple plantations. Its poison has the peculiarity of not affecting the system until several days after the bite, so that proper remedies immediately applied will counteract the venom.

Car'away, an umbelliferous biennial plant (*Carum carui*), with a tapering fleshy root, a striated furrowed stem, and white or pinkish flowers. It produces a well-known seed used in confectionery, and from which both a carminative oil is extracted and a spirit cordial distilled. The two species found in America are the descendants of naturalized European plants, that have escaped from cultivation. It is largely grown in England, on strong and rich clays, and is sometimes sown with beans, but more usually with coriander and teal, or coriander alone. After the coriander, which is only a preparatory crop, has been removed, the plants of the caraway are singled out and repeatedly hoed and cleaned. It is cut about the beginning of July, and produces on an average about 900 pounds per acre. It is a favorite crop with the Dutch. The volatile oils in caraway render it of much service in medicine. The action of these oils is to stimulate peristalsis and thus overcome flatulency. They are further antiseptic and check excessive intestinal putrefaction. They act also as mild local anæsthetics and are useful in nausea and vomiting.

Carayon, **Auguste**, *ô-güst kā-rā-yōn*, French historian: b. Saumur, 31 March 1813; d. Poitiers, 15 May 1874. A distinguished Jesuit, he wrote: 'First Canadian Missions of the Jesuits' (1864); 'Banishment of the Jesuits from Louisiana' (1865); and similar studies.

Carbajal, **Francisco**, *frān-thēs'kō kā-r-bā-hāl'*, Spanish soldier: b. Alavaro, 1464; d. near Cuzco, 10 April 1548. He served in the army in Europe; went to Mexico in 1528; and when Pizarro appealed for help against the Inca uprising he was one of the force sent by Cortez to Peru. He was marshal under Vico de Castro, in the battle of Chuas. He later took office under Gonzalo Pizarro, in the war against Diego Centeno and De la Gasca. At first he was triumphant over Centeno in the Collao, but at the battle of Sacsahuana, 8 April 1528, he was taken prisoner with Pizarro and executed. He was extremely cruel in his treatment of his enemies, but was not less noted for his humor which never failed him, not even at his own execution.

CARBALLO — CARBOHYDRATE

Carballo, kār-bāl'yō, Spain, a town in the province of Corunna, situated 24 miles northwest of Santiago. It has warm mineral springs and baths. Pop. 13,500.

Carbazo'tic Acid. See PICRIC ACID.

Car'berry Hill, Scotland, a rising ground in Mid-Lothian, about seven miles southeast of Edinburgh, between Musselburgh and Ormiston, where Mary, Queen of Scots, surrendered herself to the confederate nobles of the kingdom, 15 June 1567, just before her confinement in Loch Leven Castle.

Car'bide, in chemistry, a binary compound of carbon with a metallic element, or with certain of the non-metallic elements. Of the known carbides those of iron and calcium are most important. Carbide of iron occurs in steel, and is undoubtedly concerned in some manner, with the hardening of that metal; although the authorities are not agreed as to the precise role that it plays. The best known carbide of iron is the one having the formula CFe_3 ; but Campbell has shown ('American Chemical Journal,' XVIII., 836) that a series of iron carbides probably exists, having the general formula C_nFe_{3n} , and corresponding in a certain sense to the hydrocarbon series C_nH_{2n} ; so that when any one of the carbides of iron is treated with an acid, the corresponding hydrocarbon is set free. Calcium carbide is formed by the action of carbon upon lime at the temperature of the electric furnace. It has the formula CaC_2 , and its commercial value depends mainly upon the fact that it is readily decomposed by water, with the copious liberation of acetylene gas (q.v.). Carbide of magnesium is not formed at the temperature of the electric furnace, probably because it is not stable at that temperature. It may be prepared, however, by the action of calcium carbide upon magnesium fluoride, in accordance with the equation $\text{CaC}_2 + \text{MgF}_2 = \text{CaF}_2 + \text{MgC}_2$. Like calcium carbide it is decomposed by water with evolution of acetylene gas, the yield being 50 per cent greater, per pound of the carbide, in the case of magnesium carbide. It is not unlikely that magnesium carbide will one day replace calcium carbide for the production of acetylene gas, on account of the larger yield; but this substitution cannot be made on a commercial scale until some cheaper mode of manufacture is found. The chemistry of the carbides is still in its infancy, but within the past few years, and largely owing to the splendid work of Moissan, many new bodies belonging to this class have been discovered. Gold, bismuth, lead, and tin do not form carbides at the temperature of the electric furnace, nor do they dissolve carbon at that temperature. Platinum and iridium dissolve carbon freely, but deposit it again, upon cooling, in the form of graphite. Aluminum absorbs carbon freely, with the formation of Al_4C_3 , and similar results are obtained with many other metals and metallic oxides. The carbides of chromium, molybdenum, titanium, tungsten, and zirconium do not decompose water. Those of calcium, strontium, barium, and lithium decompose it with liberation of pure acetylene; but the carbides of aluminum and beryllium yield pure methane, and carbide of manganese gives a mixture of equal parts of methane and hydrogen. Other carbides decompose water with more complex results. Thus the carbides of the rare metals of

the cerium group yield complicated mixtures of hydrogen, acetylene, methane, and ethylene, and the carbide of uranium gives all these products (except, perhaps, acetylene), and, in addition, copious quantities of various liquid and solid hydrocarbons. The carbides of sodium and potassium, which are best prepared by passing dry acetylene gas over the corresponding metals at a temperature of about 450°F ., decompose water with liberation and acetylene. The carbides of titanium and of silicon are characterized by extreme hardness, and it is said that they will even cut the diamond with facility. Carbide of silicon is an exceedingly stable substance, and is now largely used, under the trade name of "carborundum," as an abrasive material in the manufacture of grinding-wheels, whetstones, and polishing-cloth.

Moissan's researches with the electric furnace are reported chiefly in the 'Annales de Chimie et de Physique,' and useful reviews of them have been printed at frequent intervals in 'Nature.' Moissan claims to have been the discoverer of the crystalline carbide of calcium that is now commercially familiar; but in the United States this honor is usually accorded to Mr. Willson, whose labors were certainly quite independent of those of Moissan. See ACETYLENE; CALCIUM; CARBIDE; CARBORUNDUM.

Carbohy'drate, in chemistry, a compound consisting of carbon, hydrogen, and oxygen, and having the general formula $\text{C}_6\text{nH}_{12}\text{Op}$. As will be seen, the number of carbon atoms in a carbohydrate is always divisible by six, and the oxygen and hydrogen are present in the same proportion in which they occur in water. It is not implied, however, that the compound contains water as such, but only that the oxygen and hydrogen atoms are present in the proportion of two atoms of the latter to one of the former. It will also be observed that a carbohydrate and a hydrocarbon are two essentially different things, inasmuch as a carbohydrate contains oxygen, while a hydrocarbon is a compound containing no element but carbon and hydrogen.

The carbohydrates constitute a large and very important class of substances, embracing the starches, sugars, glucoses, and gums. Their chemical relations are intricate, and are far from being thoroughly understood. Several schemes have been proposed for their classification, but owing to the present imperfection of our knowledge none is entirely satisfactory. The classification proposed by O'Sullivan is convenient, however, and will be adopted here.

Class 1.—SACCHARANS: Amorphous substances, having the general formula $\text{nC}_6\text{H}_{10}\text{O}_5$, soluble in water but insoluble in alcohol, and further characterized by the fact that when they are treated with acids they yield substances of the type $\text{nC}_6\text{H}_{12}\text{O}_6$, directly, and without the formation of intermediate compounds. Dextran, lævulan, the amylans and the galactans are examples. (These bodies are gums.)

Class 2.—SACCHARENS: Substances possessing a certain amount of structure, having the general formula $\text{nC}_6\text{H}_{10}\text{O}_5$, insoluble in either water or alcohol, and transformed by the action of acids and certain ferments first into $\text{nC}_3\text{H}_5\text{O}_2$, and finally, by the action of acids, into $\text{nC}_6\text{H}_{12}\text{O}_6$. Cellulose, starch, inulin, and tunicin are examples; the first two

CARBOLIC ACID

falling under "amylose" in the less elaborate classification which divides the carbohydrates merely into amylose, saccharose, and glucose.

Class 3.—SACCHARINS: Amorphous substances, having the general formula $nC_6H_{10}O_6$, soluble in water, but insoluble in alcohol; converted by acids first into $nC_{12}H_{22}O_{11}$, and finally into $nC_6H_{12}O_6$; and by certain ferments into $nC_{12}H_{22}O_{11}$. Glycogen, dextrin, and malto-dextrin are examples.

Class 4.—SACCHAROSES (sugars).

Group (a).—SACCHARONS: Sweet, crystallizable bodies, soluble in water and in moderately strong alcohol, having the general formula $nC_{12}H_{22}O_{11}$, and convertible by acids and sometimes by ferments into $nC_6H_{12}O_6$. Sucrose (cane sugar), lactose (milk sugar), maltose, and raffinose are examples.

Group (b).—GLUCOSES: Substances crystallizing, though not so readily as the members of the preceding group; having the general formula $nC_6H_{12}O_6$; soluble in both water and alcohol; and converted by the prolonged action of acids into substances that are no longer carbohydrates. Some of these, such as dextrose, lævulose, and galactose, are fermentable by yeast; while others, such as sorbinose, are not fermentable.

Group (c).—Certain substances, such as inosite and scyllit, which probably belong in the aromatic series and bear no special resemblance to the other members of the carbohydrate family.

O'Sullivan has also a fifth class, including those substances which, though they may not be carbohydrates in the strict sense, are nevertheless closely allied to the carbohydrates and are easily converted into them. In this class he places the glucosides and certain of the gums, mucilages, and pectins.

The carbohydrates are exceedingly important elements in the world's food supply, and may indeed be said to be essential to the maintenance of life. They are practically all of vegetable origin, and are derived ultimately from certain simple fundamental substances that are formed in the green leaves of plants. Under the influence of sunlight the chlorophyll contained in the leaves is competent to split up the carbon dioxide of the air, retaining the carbon and setting the oxygen free. The carbon that is abstracted in this way is caused to combine with the water that the leaves contain, with the production of carbohydrates; but the identity of the carbohydrate that is first formed in this way, and which serves as the starting-point for the others, is not yet established. According to the views of Sachs the "first obvious product" is starch, the formation of which he explained by the equation

It appears more likely, however, that formic aldehyde, CH_2O , is the first product, as is indicated by the equation

and that the subsequent products are built up by polymerization.

Carbohydrate metabolism is one of the most important physiological processes of the animal body. The carbohydrates are the chief source of energy and heat in the body. Most of the carbohydrates are converted into maltose by the digestive processes. This, by the action of absorption and assimilation, becomes dextrose, which sugar is the only normal sugar of the circulating fluids and the tissues. The dextrose is taken up by the blood, conveyed to the liver by the portal vein and stored up in the liver cells. Some of the dextrose is also stored in muscle, and certain portions of it are utilized by the nucleoproteids of the body. The fate of the glycogen of the body is to be oxidized into carbon-dioxide and water. The steps of this process of oxidation are very much involved, but it seems certain that an oxidizing ferment, perhaps from the adrenal glands, acting in conjunction with the pancreas, is largely influential in the process. A failure to bring about sufficient oxidation of the sugar in the body causes the well-known symptom of glycosuria, one of the features of diabetes (q.v.).

Carbolic Acid, a substance having a formula $C_6H_5.OH$, possessing feebly acid properties, and occurring chiefly in that part of the distillate from coal-tar which passes over at temperatures between $330^\circ F.$ and $375^\circ F.$ Chemically, carbolic acid has the structure of an alcohol (q.v.), and is an aromatic compound derived from benzene by the substitution of the hydroxyl group, OH , for one of the typical hydrogen atoms. It is also known as phenol, phenyl hydrate, or phenyl alcohol.

Carbolic acid, in the pure state, crystallizes in white, deliquescent needles, having a strong characteristic smell slightly suggestive of tar. It melts at $106^\circ F.$, and boils, under ordinary atmospheric pressure, at about $360^\circ F.$ Its specific gravity is about 1.07. It dissolves in alcohol, ether, and many other organic liquids, but is only moderately soluble in water under ordinary atmospheric conditions. It readily absorbs a small quantity of water from the air, forming a hydrate which is fluid at temperatures above $63^\circ F.$ If the liquid so formed is shaken with water, the greater part of the carbolic acid separates out upon standing, and the vessel is found to contain an upper layer consisting of water in which a small amount of carbolic acid is dissolved, and a lower layer of carbolic acid in which a little water is dissolved. It does not exhibit very marked acid properties, but dissolves in the alkalis with the formation of salts called phenates. It does not have a strong affinity for the alkaline bases, however, and from a strong solution of sodium phenate (for example) it may be again separated in the form of an oily liquid by the addition of another acid; the new acid appropriating the base to itself, and setting the carbolic acid free. A solution of carbolic acid, even when very weak, develops a red color when boiled with a solution of mercurous nitrate and nitrous acid. This reaction, which serves for the detection of carbolic acid, is said to be delicate enough to indicate one part of the acid in more than 100,000 parts of water.

In medicine, carbolic acid has many uses. It is highly poisonous to living matter, and is used extensively to kill bacteria. In surgery it is used as an antiseptic dressing in proportions

CARBON — CARBON COMPOUNDS

of from $\frac{1}{2}$ -2 parts of acid to 100 of water. It, or some of its derivatives or allies, is used to sterilize instruments and to disinfect wounds, rooms, and dejecta. Internally, carbolic acid is used as a bactericide, limiting excessive intestinal putrefaction. It is also an anæsthetic, and is at times of service in irritability of the stomach. When used in too concentrated a solution it is an active caustic, causing a white, painless burn. Alcohol is an excellent antidote. Taken internally in pure form in doses over two to three drops it causes poisoning with a characteristic series of symptoms. There is burning in the mouth, fauces, œsophagus, and stomach. The whitish scars of the lips and mouth are characteristic. There is great pain, with vomiting of large quantities of mucus. There is usually ringing in the ears, headache, vertigo; the urine may be suppressed, reddish or greenish; and death results with small, rapid pulse, collapse, and, may be, convulsions. Similar symptoms may develop slowly in sub-acute forms of poisoning. The urinary symptoms usually lead to the diagnosis. The treatment of the acute form of poisoning is the free use of gastric lavage, ingestion of alcohol, and the use of lime water. Symptomatic treatment and careful nursing are necessary for other symptoms.

Carbon, a non-metallic element, existing in nature in large quantities, both in the free and combined states. It exhibits marked allotropy, at least three distinctly different forms of it being known. These are (1) amorphous carbon; (2) graphite; and (3) diamond. Amorphous carbon is formed when wood or coal or almost any vegetable matter is heated strongly, out of contact with the air, and is familiar to everybody as charcoal, coke, and lampblack. Graphite (q.v.) occurs native, and may also be artificially prepared in various ways. Diamond (q.v.), which is crystallized carbon, also occurs native in certain regions, and pure specimens that are devoid of color, or which have certain special tints, are highly esteemed as gems.

Carbon has the chemical symbol C, and an atomic weight of 12.0 if $O=16$, and 11.91 if $H=1$. The specific gravity of diamond is 3.51, that of graphite is from 2.11 to 2.26, and that of hard gas-coke is about 2.35. The linear coefficient of expansion of diamond (Fahrenheit scale) is 0.0000066 at ordinary temperatures, and that of graphite is 0.000044. Graphite has an electrical conductivity of about one twelfth, and hard gas-coke about one one-hundredth, when the corresponding conductivity of mercury is taken as the unit. Diamond is practically a non-conductor. The specific heats of diamond and graphite are quite different at ordinary temperatures. Thus at 50° F. diamond has a specific heat of 0.113, graphite 0.160, and wood charcoal about 0.165. These values increase as the temperature rises, and at about 1,100° F. all three varieties have a common specific heat of about 0.44. Diamond occurs in regular octahedra and in forms derived therefrom, the faces of the crystals usually being more or less curved, and often marked with little pits. Graphite forms crystals that are commonly hexagonal or rhombohedral. Graphite was long believed to be a kind of lead, and is still popularly known as "black-lead."

Carbon is infusible, and insoluble in any known liquid at ordinary temperatures. It dissolves to a limited extent in melted cast iron, and in melted platinum it dissolves freely, separating out again in the form of graphite upon cooling. It is unaltered by the action of acids, except when some powerful oxidizing agent like chlorate of potassium or bichromate of potassium is also present. Chemically it is tetravalent in nearly all of its compounds. It combines with oxygen in two different proportions, with the formation of a monoxide CO, and a dioxide CO₂. It also forms, with hydrogen, a great number of compounds known as hydrocarbons (q.v.); and it combines with many of the metals to form carbides (q.v.). With hydrogen, oxygen, nitrogen, and small quantities of other elements, it constitutes the entire substance of animals and plants; and the coal beds that make our modern civilization possible are composed of vegetable remains from which the elements other than carbon have been mostly expelled by the combined action of heat and pressure.

For further information concerning carbon, see AROMATIC COMPOUNDS; CARBON COMPOUNDS; CHARCOAL; COAL; DIAMOND; FATTY COMPOUNDS; GRAPHITE.

Carbon Compounds, in chemistry those compounds which contain the element carbon; and since carbon is an essential constituent of nearly all organic substances, the chemistry of its compounds is practically synonymous with "organic chemistry." Until within the past half-century it was thought by many authorities that the compounds that occur in animals and plants are essentially different in nature from those that are produced in the laboratory, and that they cannot be obtained without the action of the "vital principle." This idea received its first blow in 1828, when Wohler prepared urea from substances that had been previously considered to be inorganic; yet as late as 1849 the great chemist, Berzelius, defined organic chemistry as "the chemistry of compounds formed under the influence of life." A vast number of substances that were formerly classed as organic have now been prepared in the laboratory, and the old classification of chemistry into organic and inorganic branches has broken down, the organic division being now more commonly and correctly called the "chemistry of carbon compounds."

The carbon compounds form a group of great complexity, and are apparently unlimited in number. The reasons for this are that carbon is quadrivalent; that it forms multitudes of compounds with hydrogen alone, in many of which more or less of the hydrogen can be replaced by other elements, with the formation of new and altogether different substances; that its chemical bonds are apparently powerful; and that it unites with elements of the most widely different nature.

In a general way, the better-known carbon compounds are mostly divided into two great classes, according to the type of the "graphical" or "structural" formula that must be used in order adequately to represent their chemical relations. The first class includes all those bodies whose structural formulæ are distinguished by the fact that the atoms (or radicals) that are present form "open" chains, which do not any-

CARBON DIOXIDE — CARBON DISULPHIDE

where return into one another. The hydrocarbon "propane," which has the structural formula

is an illustration of this class. The "open chain" compounds are called fatty compounds, and are treated under that heading. The name was originally given because many of the substances that are included in the class have long been known in connection with fats and allied bodies; but it would be more logical to call them "methane derivatives," since they may be considered to be obtainable from the hydrocarbon methane, CH_4 , by a process of substitution.

The second great class of carbon compounds is distinguished by the fact that the structural formulae that are required in order to exhibit the chemical properties of its members return into themselves, so as to form "closed" chains or rings, which (at least in the fundamental forms) contain six carbon atoms. Benzene is a familiar example. From the fact that many of the first known representatives were balsams, oils, and resins, these substances are known collectively as aromatic compounds, and are described under that heading. A better name would be "benzene derivatives," since all the members of the class are derivable from benzene by substitution.

In addition to the aromatic and fatty compounds, others are known which do not properly come under either heading. Thus the structural formula of furfuran contains a closed ring, formed by the union of four atoms of carbon and one of oxygen. Closed rings, consisting of three, four, and five atoms of carbon, are also known. The pronounced analogies and affinities that exist among the members of the aromatic and fatty groups, respectively, have forced those two groups upon the attention of chemists. Those compounds of carbon which are not strictly included within either have not yet been classified upon a similarly broad basis.

The principal phenomena of the carbon compounds are given under special headings. In addition to those already given, see, particularly, ISOMERISM; and RADICAL.

For an excellent presentation of the whole subject, see Hjelt, 'Principles of General Organic Chemistry.'

Carbon Dioxide, Carbonic Acid Gas, or Carbonic Anhydride, CO_2 , is formed whenever carbon is burned in the presence of excess of oxygen or air. It is a colorless, odorless gas, soluble to a considerable extent in cold water, especially when subjected to pressure. Its solution possesses feebly acid properties, and has a peculiarly pungent taste, on account of which the aqueous solution of the acid is greatly used as a constituent of various beverages. The ef-

fervescence accompanying the opening of a bottle of beer, soda-water, or champagne, is due to the escape of the carbon dioxide that was previously held in solution. Carbon dioxide occurs in great abundance in nature, both free and in combination with various elements, in the form of carbonates. Carbonate of lime, CaCO_3 , is one of the most common carbonates. It is formed when the gas is allowed to bubble up through a solution of lime water, and exists in nature in vast masses, as limestone and marble. (Other carbonates are described under the metals that constitute their bases.) Carbon dioxide is a constant constituent of the atmosphere (see AIR), occurring even at the tops of mountains and in the air collected from balloons. It is generated by the combustion of fuel, by respiration, by fermentation, and by the decay of animal and vegetable matter. In some localities, too, immense quantities of the gas are emitted from the ground, or from mineral springs and wells, as in the Grotto del Cane, the Cave of Montjoly in Auvergne, in the valley of Wehr, in the Eifel, and at many other places. It is being simultaneously abstracted from the air by plants, which in the sunlight decompose the gas, fixing the carbon that it contains, and setting the oxygen free. Carbon dioxide has but feeble affinity for the bases with which it combines, and is readily replaced by almost any other acid. In preparing the gas for experimental purposes the usual method is to add a dilute mineral acid to pulverized marble or other carbonate, the carbon dioxide then being liberated continuously and in large quantities. The gas is about 1.53 times as heavy as an equal bulk of air. Its critical temperature is about 90°F. , and at any temperature lower than this it can be reduced to a liquid by the application of pressure.

Poisoning by this gas frequently results in closed rooms crowded with people. The symptoms may be very slight, consisting of a mild indisposition, or they may be severe—headache, nausea, vomiting, etc. In poisoning in the severer grades there is cyanosis, coma, and unconsciousness. Carbon dioxide alone is not a fatal poison; it is rendered so usually by the diminution of oxygen supply.

Carbon Disulphide, CS_2 , a liquid formed when the vapor of sulphur is passed over red-hot charcoal. Under normal conditions it is a very volatile, inflammable liquid, having a specific gravity of 1.29, and boiling at 115°F. The commercial disulphide has an exceedingly disagreeable smell, but this is due to the presence of impurities. The pure liquid has a pleasant, ethereal smell. Carbon disulphide (or bisulphide) does not mix with water, but it dissolves sulphur, phosphorus, caoutchouc, and many other organic bodies that are difficultly soluble in other menstrua, and it is to this property that it owes its commercial value.

Poisoning by carbon disulphide is becoming very prevalent since the use of rubber goods has become so extensive. The symptoms of acute poisoning are due to a poisoning of the blood and a central paralytic action on the nervous system. The blood action is that of a breaking up of the red blood cells, hemolysis. This results in cyanosis, pains, headache, coma, vertigo, nausea, vomiting, weakness, unconsciousness, coma, and death. Such symptoms

CARBON MONOXIDE — CARBONIFEROUS PERIOD

are rare, the poisoning developing as a rule much less rapidly. In workers in rubber factories, in which there is much vapor of CS_2 , there develop disturbances of temper, pressure feelings on the head, heat, and the feeling as if the blood would burst through the skull, with headache. There may also be symptoms of irritation of the bronchi, coughing, and roughness of the voice, etc. Treatment is fresh air and symptomatic.

Carbon Monoxide, or Carbonic Oxide, CO , is produced, in addition to the dioxide, when carbon is burned with a limited supply of air or oxygen. It is also generated by passing carbon dioxide through a red-hot bed of carbon, in accordance with the equation $CO_2 + C = 2CO$. For experimental purposes the gas may be generated by decomposing oxalic acid by heating it with strong sulphuric acid, and passing the gases that are evolved through a solution of caustic soda to absorb the carbon dioxide that is present. Carbon monoxide is colorless, and has a density about 0.97 times that of air. It burns with a lambent, blue flame that is often seen in coal fires that have been freshly supplied with fuel.

Carbon Oxychloride. See PHOSGENE.

Carbonado, or Carbon, a massive, black or dark-gray variety of diamond, also called "black diamond." Though possessing the adamantane or resinous luster of the crystallized variety, it is opaque and, therefore, of no value as a gem. It is the hardest substance known and this fact makes it the most desirable for use in diamond drills; it therefore sells for as high a price per carat as one carat rough gem diamonds (q.v.). Being without cleavage it is less brittle than the crystals, and owing to its somewhat porous structure, its specific gravity is less, 3.15 to 3.29. The commercial supply comes exclusively from the province of Bahia, Brazil, where it occurs in angular fragments which occasionally show a rough cubic outline.

Carbonari, kār-bō-nā'rē (colliers, or more strictly, charcoal-burners), the name of a large political secret society in Italy. According to Botta's 'Storia d'Italia' the Republicans fled, under the reign of Joachim (Murat), to the recesses of the Abruzzi, inspired with an equal hatred of the French and of Ferdinand. They formed a secret confederacy, and called themselves carbonari. Their chief, Capobianco, possessed great talents as an orator. Their war-cry was "Revenge for the lamb mangled by the wolf!" When Murat ascended the throne of Naples he employed Maghella, a Genoese, in the department of police, and afterward as minister. All his efforts were directed to the union and independence of Italy, and for this purpose he made use of the society of the Carbonari. The ritual of the Carbonari was taken from the trade of the charcoal burner. Clearing the wood of wolves (opposition to tyranny) was the symbolic expression of their aim. By this they are said to have meant at first only deliverance from foreign dominion; but in later times democratic and anti-monarchical principles sprang up. They called one another good cousins. No general union of the order under a common head seems to have been effected. The separate societies in the small towns entered into a connection with each other, but this union extended

no farther than the province. The place of assembly was called the hut (*barraca*); the surrounding neighborhood was called the wood; the meeting itself was distinguished as the sale (*vendita*). The confederation of all the huts of the province was called the republic, generally bearing the ancient name of the province. The chief huts (*alta vendita*) at Naples and at Salerno endeavored to effect a general union of the order, at least for the kingdom; but the attempt appears to have been unsuccessful. The order, soon after its foundation, contained from 24,000 to 30,000 members, and increased so rapidly, that it spread through all Italy. In 1820, in the month of March alone, about 650,000 new members are said to have been admitted; whole cities joined it. The clergy and the military, in particular, seem to have thronged for admission. The religious character of the order appears from its statutes: "Every Carbonaro has the natural and inalienable right to worship the Almighty according to the dictates of his conscience." After the suppression of the Neapolitan and Piedmontese revolution in 1821, the Carbonari throughout Italy were declared guilty of high treason, and punished by the laws. Meantime societies of a similar kind had been formed in France, with which the Italian Carbonari amalgamated, and Paris became the headquarters of Carbonarism. The organization took on more of a French character, and gradually alienated the sympathies of the Italian members, a number of whom dissolved connection with it, in order to form the party of Young Italy.

Car'bonates. See CARBON DIOXIDE.

Car'bondale, Pa., a city of Lackawanna County, situated on the Lackawanna River, 110 miles north-northwest of Philadelphia; and on the Erie, the Delaware & H., and the New York, O. & W. R.R.'s. It is the centre of an important anthracite coal-field, and the principal industry is mining. There are also machine-shops, foundries, etc. As it is in a mountain region with fine scenery, it is also a summer resort. Pop. (1900) 13,536.

Carbonear, kār'bōn-ēr, Newfoundland, a port of entry on the eastern side of the peninsula separating Trinity Bay from Conception Bay 25 miles in a northwesterly direction from St. John's. Pop. (1901) 3,703.

Carbonic Acid, or Carbonic Acid Gas. See CARBON DIOXIDE.

Carbonic Anhydrid. See CARBONIC DIOXIDE.

Carbonic Oxide. See CARBON MONOXIDE.

Carboniferous Limestone, or Mountain Limestone, certain limestones of Lower Carboniferous age, as named by Murchison and other English geologists. In the United States the silver-lead ores of Leadville and other Rocky Mountain camps, and the zinc and lead ores of southwestern Missouri, are in limestones of Carboniferous age. See CARBONIFEROUS SYSTEM.

Carboniferous Period, the last of the great time divisions of the Palæozoic Epoch. During it were laid down vast beds of plant-remains now turned to coal, whence the name. It is true that coal fields of later age than Carboniferous are known, particularly in North America, but the important coal fields of Europe and of eastern North America are of Carboniferous age. In North America, when the

CARBONIFEROUS SYSTEM

Carboniferous Period began, most of New England, eastern Canada, and Newfoundland was land, though two long, narrow arms of the Gulf of St. Lawrence extended to Narragansett Bay. West of the Blue Ridge Mountains, or Appalachian uplift, was a great interior sea, in places quite deep and extending to the Rocky Mountains. During Carboniferous time, by a gradual uplift, the northeastern part of this sea was divided into two bays, one covering nearly all of Pennsylvania, West Virginia, eastern Ohio, and Kentucky, the other covering southern Michigan. In the west the old land surfaces sank, and great areas along the whole Rocky Mountain region and beyond were covered by the sea. In general, the Carboniferous in North America was a period of slow changes of land surface with no volcanic outbursts. In the eastern part of the continent the land sank, then gently rose, over great areas, forming vast swamps, with numerous oscillations following. The sea covered most of the land west of the Mississippi. In Europe a clear sea stretched from inland to central Germany at the beginning of Carboniferous time, but later this area was a series of swamps. In Russia the land, after several changes of level, sank, and a great area, comprising southern Europe and Asia and part of northern Africa, was covered by the sea.

The plant-life of the Carboniferous Period — entirely gymnosperms and angiosperms — showed some advances from the Devonian. The ferns were most abundant, some being like tall trees, others as small as the maiden-hair fern of to-day. The most conspicuous growths in the Carboniferous forests were the Lycopods or club-mosses, now represented by insignificant forms, but then growing sometimes 75 feet or more high, with trunks three feet in diameter, and spreading branches (*Lepidodendron*). Other Lycopods (*Sigillaria*) had short, thick trunks with few if any branches. Still another group of cryptogams, the *Equiseta* or horse-tail rushes, were of far greater importance in Carboniferous time than now. Of these the *calamites*, with their tall, slender stems, must have been one of the commonest plant forms of the Carboniferous forest. No plants with conspicuous flowers existed, the flowering plants being gymnosperms of which one of the commonest was *Cordaites*. The Carboniferous forests were probably gloomy and featureless. The singularity of the flora over the whole world from Siam to Spitzbergen indicates a uniform climate without temperature zones.

Of animal life, corals, especially the genus *Lithostrotion*, were abundant; and the *Foraminifera*, especially the genus *Fusulina*, became of importance. Of the echinoderms the extinct blastoids, particularly the genus *Pentremites*, were abundant, and the Carboniferous is the period in which the crinoids, or sea-lilies, reached their highest development. Sea-urchins (echinoids) were more plentiful than in the Devonian, but the trilobites were slowly dying out. Of the land arthropods, scorpions were fairly abundant, and the first true spiders appeared. The brachiopods were less abundant than in the Devonian, the genus *Productus* being of most importance. Bivalve mollusks were numerous, among them being the first land shell. Of the fishes, the sharks, notably the orders *Pleuracanthus* and *Acanthodes*, were remarkably developed. Amphibians, which probably existed in

Devonian, increased greatly in Carboniferous time, but belonged to an order now extinct, *Stegocephala*, and were of small or moderate size, no species being over eight feet long.

Carboniferous System. As the rocks laid down in Carboniferous time furnish by far the greater part of the world's supply of coal, they have been very carefully studied in many different places and accurately mapped, so that more is known of the Carboniferous rocks than those of any other Palæozoic system. By American geologists the rocks are divided into two series, an upper and a lower, which differ greatly in Nova Scotia, the Appalachian States, the Mississippi valley, and the Rocky Mountain States.

The Lower Carboniferous series, in what is called the Acadian province, Nova Scotia, and New Brunswick, is made up of thick beds of sandstone and limestone overlaid by limestones containing masses of gypsum. The total thickness of the series is 6,000 feet. In Pennsylvania the Lower Carboniferous series is divided into the Pocono sandstone and the Mauch Chunk shales, with a total maximum thickness of 4,000 feet. Westward there are in Ohio the Waverly beds, shales with some limestone, and in Michigan the marshall beds, sandstone and gritty shales, with limestone and gypsum above. Farther west the Lower Carboniferous is represented by the Mississippian series, including the Kinderhook, Osage, St. Louis, and Chester stages, all limestones, with a maximum thickness of over 1,200 feet in southern Illinois. These limestones underlie the eastern and western interior coal fields (see COAL). In southwestern Virginia are limestones, sandstones, and shales of Lower Carboniferous age, 2,000 feet thick, and containing a few workable beds of coal. In the Rocky Mountains the Lower Carboniferous rocks are, with few exceptions, limestones.

The rocks of the Upper Carboniferous include the great coal fields of eastern North America. (For the origin of coal fields, see COAL.) The rocks of the coal measures are sandstones or conglomerates, grits, shales, clays, limestones, and seams of coal. A coal seam is usually underlain by a bed of fire-clay, representing an old soil, and overlaid by shale. The total thickness of the Nova Scotia coal measures is 7,000 feet, and 76 distinct seams of coal are known. In Pennsylvania the coal measures have been separated into the millstone grit, lower productive, lower barren, and upper productive stages, and have a total thickness of 4,000 feet. In Michigan the coal measures are about 300 feet thick; in the eastern interior (Illinois-Indiana) field 600 to 1,000 feet, and in the western interior field the thickness varies widely, reaching a maximum in Arkansas.

The Upper Carboniferous rocks cover wide areas in Utah, Colorado, and Arizona; they also occur in the Black Hills in South Dakota, and in California, and British Columbia. They are generally limestones or sandstones, and contain no coal beds. The distinction between Upper and Lower Carboniferous is not as sharp as in the Mississippi valley. The total thickness of the whole Carboniferous series in Nevada and Utah is about 13,000 feet.

In western Europe the Lower Carboniferous limestones reach from Ireland to central Germany, with a maximum thickness in England of 6,000 feet. In southeastern Germany the Lower

CARBORUNDUM — CAR BUILDING INDUSTRY

Carboniferous rocks are sandstones and slates, while in Russia the coal measures of Lower Carboniferous age are overlaid by a great thickness of Upper Carboniferous limestone. In Asia the Chinese coal measures are of Upper Carboniferous age, and are underlaid by Lower Carboniferous limestone. In South America the Lower Carboniferous is mostly made up of sandstones, and the Upper of limestones, with very few coal seams.

See Dana, 'Manual of Geology'; Giekie, 'Text Book of Geology'; 'Report of the United States Geological Survey' (1900-01, Part III.).

Carborundum, a trade name for carbide of silicon, SiC . This compound is produced by melting sand and carbon together in the electric furnace. It is characterized by extreme hardness, and is used for abrasive purposes, as a substitute for corundum and emery. It was discovered by E. S. Acheson in 1890, and is now manufactured in large quantities at Niagara Falls. The production is probably about 1,500 tons per annum.

A new and valuable use for carborundum is covering firebrick with a highly refractory coating. Since carborundum can only be melted at extremely high temperatures, the electric furnace being required for the purpose, it follows that the temperatures ordinarily generated for smelting of ores and metals are much below its fusing point. Finely powdered carborundum is made up into a paste with sodium silicate, or some similar binding substance; and the paste is applied by means of a brush, or otherwise, to the bricks which are intended to be used for building a furnace, or those bricks are actually immersed in the viscid liquid for a certain time. If the furnace has already been built, the paste can be painted on the exposed surfaces. It is stated that a layer one twelfth inch thick will protect the bricks from the attack of the highest temperature which is ever produced by combustion methods in ordinary work.

Carboy, a large and somewhat globular glass bottle protected by an outside covering of wickerwork or other material, for carrying vitriol or other corrosive liquids.

Car Building Industry. The memory of men still living is sufficiently elastic to stretch back to the beginnings of steam railroads in this country, and to comprehend the various changes by which the modern railway has become a highly organized and elaborately equipped mechanism. We borrowed the railway from England, but developed it on our own lines. The invention of the locomotive at first simply furnished a mechanical power to transport freight in cars that had formerly been hauled by horses. Tramways were in use in the Hungarian mines during the 16th century; and Ralph Allen's English stone-car of 1734, with its flanged wheels and its hand-brake, is clearly the forerunner of the freight-cars of to-day.

The term "railway" was invented in 1775, when it was first used in Smeaton's reports on English transportation, a quarter of a century before steam was applied to locomotion. Thanks to the recent researches of Mr. Clement E. Stretton, we now know that the first persons ever conveyed by a locomotive on rails traveled, on 24 Feb. 1804, behind Trevethick's locomotive on the Pennydarran cast-iron plateway or tram-road to Merthyr-Tydvil, in Wales, a distance of

nine miles. In order to transport long bars of iron and timber, the cars were made in pairs, coupled together by an iron drawbar having a joint at either end. The cars had no sides, but in the middle of each was fixed a centre-pin upon which worked a cross-beam or bolster, and upon this cross-beam the timber or bars of iron were placed. On the occasion referred to the trucks were loaded with 10 tons of iron bars, and 70 persons stood on the iron. Here we have the origin of the bogie or truck, the invention of which has been claimed for this country, as we shall see hereafter. Also the capacity of the freight-car, fixed at the beginning at 10 tons, remained at that figure for half a century or more.

In 1812 John Blenkinsop of Leeds had a private car built to carry himself and his managers to his Middleton colliery, while the workmen rode on the coal-cars. On 27 July 1814, George Stephenson's first locomotive, Blucher, drew over the Kenilworth colliery line a passenger-car made by placing the body of Lord Ravensworth's four-in-hand coach on a wooden frame fitted with flanged wheels. This car was used for 20 years. On 27 Sept. 1825, the Stockton & Darlington Railway was opened, and trains of coal-cars were run, with one passenger-coach named the Experiment. This was the first passenger-car to be run regularly for the use of the public. It was placed on four wheels, and had a door at each end, with a row of seats along either side and a long deal table in the centre. This car was operated 10 days, until the novelty was worn off; and then the faster stage-coaches carried the passengers. It was not until 15 Sept. 1830 that the Liverpool & Manchester Railway opened its line with a train carrying 600 passengers, and immediately thereafter began to run the first regular passenger-trains.

It is a striking fact in the history of car construction that the English invented both the truck and the long passenger-car with the door at each end; and that these forms, once invented, were almost immediately discarded in England, so that it was left for this country to reinvent them and to make them the distinguishing features of American car building as contrasted with English construction. Indeed, it has been with great reluctance that we have ceased to claim them as original discoveries.

The fact that passenger-trains, by displacing stages, threw out of use many of those vehicles, coupled with the other fact that the stage owners, submitting to the inevitable, often became railroad promoters, furnishes a reason why the early masters of transportation both used the stage-coach body as a matter of economy, and also built their new cars on the model in which the conveniences of travel had been most highly developed. The first passenger-coach used in Pennsylvania in 1832 was a stage-coach slightly enlarged. To be sure, the early prints show that in 1830 Peter Cooper's first locomotive hauled an open boat-shaped car from Baltimore to Ellicott's Mills, on the Baltimore & Ohio Railroad; but this model must have been adopted for economy's sake, because in 1833 that railroad placed in service the Ohio, a car, stage-coach in shape, with seats on top as well as inside.

As President Mendes Cohen well observed in his address before the American Society of

CAR BUILDING INDUSTRY

Civil Engineers in 1892, the first important modifications in car building were called forth by the speed developed in the locomotive. Naturally the wheels first demanded attention. The names of four men are connected with early wheel improvement. Mr. Knight improved the shape of the tread and flange; John Edgar and Ross Winans developed the chilled features; and Phineas Davis further improved and perfected the wheel by altering the disposition of the metal in the tread and the angle of the flange, and by introducing within the cast-iron wheel a wrought-iron ring of five eighths or three quarters of an inch round iron, both perfected the chill and added strength to the wheel. Mr. Winans' shops turned out thousands of these wheels for use not only in this country, but also in Germany and Switzerland. From 30,000 to 50,000 miles represented the capabilities of a Winans wheel.

With increased speed came the need for increased steadiness, and it occurred to Ross Winans that by adopting the device of the bogie, or swiveling truck used in the transportation of freight, he could build an easy-riding passenger-car. In 1833 Mr. Winans constructed three long houses on wheels, each capable of seating 60 passengers. Having patented his invention, he was confronted by the fact that the principle he had used was one that had been utilized frequently on tramways, and particularly on the famous Quincy granite railroad, built to transport stone for the Bunker Hill Monument. At the end of protracted litigation the courts annulled the patent.

We now know that prior to 1830 England had three bogie-engines at work; that in 1831 Stephenson's John Bull, built for the Camden & Amboy road, was made into a bogie after it reached this country—a fact made patent by the famous run of that engine from New York to Chicago in 1893; that Horatio Allen used a bogie-engine on the South Carolina Railroad in 1832, the same year in which the bogie-locomotive Experiment was built for the Mohawk & Hudson Railroad. Moreover, the bogie principle was patented in England in 1812. Yet, whatever may be the legal aspects of the case, it is certain that the American passenger-car of to-day originated with the three passenger-coaches built in Ross Winans' shops in 1833. England discarded the bogie principle for engines in 1830, and did not return to it until 1876; and that country to this day has not adopted the bogie for passenger- or freight-cars. In 1880, the Paris, Lyons & Mediterranean Railway adopted the bogie for certain passenger-cars; and in 1895 the Great Western Railway of England began to experiment with the bogie-truck. In America the Winans passenger-coach almost immediately supplanted everywhere the stage-coach form, which England still retains in a modified shape, excepting only on the Pullman cars, introduced into that country in 1874. With us not only the passenger-cars, but the baggage, mail, and freight-cars, all were placed on swiveling trucks.

That the early railroads of this country were designed to carry passengers rather than freight is to be seen by their reports. The Baltimore & Ohio road, from 1 Jan. 1831, to 1 October carried over its 13 miles of track 5,931 tons of freight and 81,905 passengers; and so late as 1839 the Camden & Amboy carried only 13,520

tons of merchandise as against 181,479 passengers. In fact, the railways as freight carriers could not compete with the canals, which in those days were the traffic routes. In 1831 the Tuscarora & Port Carbon Railroad could not meet canal rates by 39¼ cents per ton, the railway charges being 40 cents, plus a toll of 15 cents per ton, while the canal rates were 10¼ cents, plus 5 cents toll.

Mr. John Kirby, describing from memory the freight-car of 1848, says that it was the same square box it is to-day; its capacity was from six to ten tons; the roof was covered with cotton duck painted and sanded. The hot sun cracked this covering and let the water in on the freight, an annoyance common also to passenger-coaches of that day. Few freight-cars were used in New York State at that date, the Erie Canal being sufficient for summer freight. Wood was the universal fuel, so there was no coal transportation. Wooden brake-heads were used, and it required three men to turn the screw that pressed the wheels on and off the axles. The ripping of planks was done by hand, as was also the dressing up; and when one man had tools to grind, a fellow-workman turned the stone. Carpenters and car builders of six years' experience commanded \$1.12½ a day wages.

Viewed from the standpoint of to-day, the passenger-car of the early 'fifties, built at a cost of about \$2,000, was a combination of inconveniences. The cast-iron stove in the centre of the car broiled those who sat immediately around it, while the unfortunates one seat removed from its satanic glare shivered and froze. In summer the dust was intolerable, and, notwithstanding elaborate devices for ventilation, the dust problem did not begin to be solved before the appearance of the monitor roof in 1860. Hot-water heating and the abolition of the deadly car-stove came with the Pullmans.

In 1856 Captain (now Sir) Douglas Galton, of the Royal Engineers, was sent to America to investigate our railways. His report to the lords of the Privy Council for Trade gives a straightforward and unbiased account of his investigations. Perhaps there is extant no other report which so comprehensively discusses the railway situation in the United States about that date.

"The practice of constructing railways [in America] in a hasty and imperfect manner," says Capt. Galton, "has led to the adoption of a form of rolling stock capable of adapting itself to the inequalities of the road; it is also constructed on the principle of diminishing the useless weight carried in a train. The principle is that the body of the car is carried on two four-wheeled trucks, to which the body is attached by means of a pintle in the centre, the weight resting on small rollers at each side. The framing of the truck is supported on springs resting on the axles, and the pintle and rollers are fixed to a cross-beam, which is attached by springs to the main framing; so that between the body of the car and the axles are a double set of springs. India-rubber springs are in general use, but they often become hard; consequently sometimes steel springs are used, with great advantage. Any side movement which might result from the slight play allowed to the cross-beam is counteracted by springs placed between its ends and the framing. An iron hoop attached to the framing passes under

CAR BUILDING INDUSTRY

the axle on each side, so as to support the axle in case it should break."

The bearings Capt. Galton found not unlike those used in England, but the use of oil as a lubricator was novel. He was told that under favorable circumstances the oil in an axle-box needed to be renewed but once a month; but that it was difficult to obtain good oil. The wheels were of cast-iron, with chilled tires; they were from 30 to 36 inches in diameter, weighed rather more than 500 pounds, and were without spokes. When made by the best makers they would run from 60,000 to 80,000 miles before the tires were worn, and they cost from \$14.50 to \$17.00 each. The iron used in making wheels was of very superior quality; and so great was the practical skill required that but three firms in the United States could be relied on to furnish wheels of the first grade.

The most approved form of draw-bar was continuous under the car, and was attached to the elliptic springs, acting in both directions. The iron shackle was in general use, but some railways preferred an oak shackle 18 inches long, two inches thick, and six inches broad. This block was bound with an iron band divided on each side at the centre, so that a car on leaving the rails would break the shackle transversely.

Already the automatic coupler for freight-cars was prefigured in a device by which the pin in the bumper of one of the cars was supported by means of a ball, so that the shackle of the on-coming car pushed back this ball and let the pin fall into its place. All passenger-cars and most freight-cars were supplied with brakes; and the Philadelphia & Reading Railroad was endeavoring to anticipate the day of train-brakes by an invention whereby a sudden check in the speed of the engine applied the brakes to the wheels of all the cars. The saloon, the car-stove, and the ice-water tank all had established themselves in the best cars, and were novelties to the visiting Englishman.

On the Illinois Central, between Cairo and Dubuque, some of the cars were filled with compartments in which the backs of seats turned up and so formed two tiers of berths or sofas, for the accommodation of persons who might wish to lie down and were willing to pay for the privilege. The passenger-car had attained a length of 60 feet, though the 30- and 45-foot cars were more common; the baggage-cars, with their compartments for mail and express, were 30 feet long, and the freight-cars from 28 to 30 feet. In those days the freight-cars were constructed more strongly than were the passenger-coaches; a Baltimore & Ohio freight-car 28 feet long, and with a capacity of nine tons, itself weighed six tons.

In summing up the result of his observations as to the rolling stock in this country, Capt. Galton notes that the Americans appear to have taken their ideas more from a ship than from an ordinary carriage, and to have adopted the form best calculated to accommodate large masses, with a minimum of outlay for first cost; and that while the cars had been designed with a view to avoid every appearance of privilege or exclusiveness, or of superiority of one traveler over another, they had been constructed so as to secure to every traveler substantial comfort and even privacy.

"There is but one class," he said; "but as the cars are designed with more regard to comfort than English railway carriages, this class is much superior to our second and third classes, and is inferior only to the best first-class English carriages. Notwithstanding the superior comfort of the American railways, the rates of fare averaged lower than the second- and sometimes even the third-class fares in England."

Of necessity progress in car-building had to wait for the development of the railroads. The original roads were not constructed as through lines between the larger cities, but as the connecting-links between natural waterways, answering to the portages or carrying places of the old days when commerce was conducted in canoes. Often built as the result of local or State enterprise, a short line was sufficient to use up the scanty capital available, or to exhaust the willingness of the people to be taxed for public improvements. The great systems of to-day represent survivals of the fittest early ventures, and development according to environment. Thus the various small roads which traversed the present main line of the New York Central were not consolidated until 1853, and the same year the roads between Philadelphia and Pittsburg came under one control. So late as 1862 there were five separate companies operating the lines between Lake Erie and Lake Michigan; and as each road had a gauge of its own, it was regarded as a triumph in car construction when freight-cars of compromise gauge were built to run over all five roads. In 1860, however, the Lake Shore & Michigan Southern lines came under a single head.

When, in October 1865, a combination was formed among eight railroads to establish a fast freight line between New York and Boston and Chicago, the maximum difference in the gauges of the several lines was one inch; and this was compensated for by a broad tread wheel. Each company contributed a number of cars proportionate to its mileage, one car for every three (afterward increased to one for every two) miles. In 1865 the quota of the Lake Shore & Northern Indiana was 179 cars; while in 1894 that road's quota of Red Line cars was 2,200.

In 1862 the United States government conducted the greatest railroad business known up to that time. With headquarters at Nashville, the government operated 1,500 miles of road with 18,000 men, whose monthly wages amounted to \$2,200,000. The rolling stock consisted of 271 engines and 3,000 cars. No entirely new locomotives were built, but the 3,000 men employed in the locomotive repair shops pieced out fully equipped engines founded on a serviceable boiler or a pair of sound driving-wheels. Among the triumphs of the national car-shops were, first, a headquarters car for Gen. Thomas, the car being 50 feet long, iron-plated, and provided with a kitchen, a dining-room, a sleeping apartment, and an office; and, secondly, the hospital-trains, in which the jars and jolts were reduced to a minimum. It was during the year 1864 that Gen. McCallum and Col. Wyman came to Detroit and summoned the managers of the Michigan Car Company to stop all building then in progress and to work solely for the government. They gave a contract for a number of box- and flat-cars to be operated

CAR BUILDING INDUSTRY

on southern roads; and inasmuch as the gauge differed from that of the northern roads, the new cars were loaded on flat-cars and sent to Cincinnati. The government officials fixed the price of the cars and made payment in certificates, some of which the company exchanged for materials, and the remainder were held until money could be obtained for them.

The enormous transportation business developed by the war, together with the labor conditions and the paper-money issues, combined to raise the price of cars; so that the standard freight-car of 1864, a car 28 feet long and with a capacity of 10 tons, cost \$1,000 or more. About 30 years later a car 34 feet long, with a capacity of 30 tons, and provided with automatic couplers, air-brakes, and other improvements, could be purchased for about \$500.

When the war ended the managers of railways were called on to face a heavy decline in both freight and passenger traffic, due to the disbanding of the armies. Money was not plentiful, cars were very expensive, and the mania for extending lines into new territory had begun. Under these conditions the roads began a system of borrowing cars from the builders or from car-trust companies. The Michigan Car Company was probably the first to make contracts on a car-loaning basis; he that as it may, this company had at one time loaned to railroads between 6,000 and 7,000 cars, payment being made according to the car's mileage. With better times and better credit the roads began to buy cars for cash or on long time, as was most convenient; and loaning freight-cars to railroads on a mileage basis was practically discontinued. A majority of the refrigerator-cars, however, continued to be owned by private parties and run on a mileage basis. The reduction in the mileage rate practically killed the business of private ownership, since the new rate did not much more than pay for the repairs.

The sleeping-car had its beginnings as early as 1838. The *Baltimore Chronicle* for 31 October of that year described one such car that had been put on the line between Baltimore and Philadelphia. The enthusiastic reporter related that the car had berths for 24 persons, and that for a small consideration the weary passenger might spend the six hours of travel between those cities as pleasantly as if he were asleep in his own bed. Nothing then seemed to be wanting except dining-cars, and those were promised for the near future—a promise, alas! not fulfilled for many a long year.

Twenty years later, in 1858, George B. Gates invested \$5,000 in two sleeping-cars to run between Cleveland and Buffalo; but passengers could not be persuaded to use them. The same year the line between Toledo and Chicago was equipped with two sleeping-cars built by the Wason Company, of Springfield, Mass., and owned by Mr. Bates, of Utica, N. Y. These cars were 50 feet long, with 16 sections in summer and 14 in winter. When not in use the bedding and curtains were stored in an end section; and a single wash-basin and one saloon furnished the toilet conveniences for the 48 persons the car was expected to carry. A sofa along the side of the car formed the lower berth, the middle one was hinged to the window-casing, and the upper berth rested on cleats fastened to permanent cross-partitions. It was

while traveling in one of these cars, in 1858, that Mr. George M. Pullman began to plan the sleeping-cars that have revolutionized railway travel in this country, and are making their way in Europe, where comfort is less an essential to the traveler than it is in America.

In 1859 Mr. Pullman transformed two Chicago & Alton coaches into better sleeping-cars than any others; but it was not until 1863 that the Pioneer, the first Pullman, was placed on the road. The car cost \$18,000—an astounding price in those days. It was higher and wider than most roads could admit, and it was not until President Lincoln's funeral that the roads between Chicago and Springfield narrowed their platforms and adapted their bridges so as to allow the Pioneer, carrying the funeral party, to pass over their lines. Shortly afterward Gen. Grant's trip from Detroit to Galena, Ill., in the same car, opened those lines to the Pioneer. After that time progress was rapid. The Pullman Company was organized in 1867, and its success is too well known to need comment here. From the palace sleeping-car to the parlor- and the dining-room car is a short step. But a long jump was taken in the vestibule, invented by Mr. Pullman in 1887, by which trains are made solid and the platform is robbed of the last of its terrors.

In the winter of 1868-9 the first Westinghouse air-brake was used on the Steubenville accommodation train running on the Pittsburgh, Cincinnati & St. Louis Railroad. The Pennsylvania road adopted it, and since the automatic feature was added, in 1873, it has come into almost universal use on passenger-trains, while by far the larger proportion of new freight-cars built are equipped with it. In 1887 a train of 50 freight-cars made a triumphal tour of the great lines, and by repeated tests, under varying conditions, proved that the Westinghouse brake can stop a train in one tenth the space required by the hand-brake. In 1867 Col. Miller placed his patent platform, buffer, and coupler on three cars building in the shops at Adrian, Mich.; and with great rapidity the dangerous old platform, with its loose link coupling, disappeared. In 1860 the Post-Office Department began to demand more room from the railroad companies, and year by year the mail-cars were increased from 17 to 20 feet in length, then to 35, and finally to 60 feet.

The interchange of cars among the various roads made it necessary to adopt standards in car construction, in order to facilitate repairs to cars when away from the home road. Some authority, too, was needed to settle disputes between roads, arising from charges for repairs; to investigate new brakes and couplers; and, in general, to keep the work of construction fully abreast of the times. The Master Car Builders' Association, organized in 1867, amply fills this need; and the reports of its annual meetings contain the latest word on all subjects relating to car-building. Its arbitration committee also acts as a court of conciliation for the various roads.

Prior to the panic of 1873 all the car-works were busy. That panic caused the failure of a large number of new railroads, which, in turn, forced into bankruptcy and eventual reorganization many car companies. From 1873 to 1879 the car-shops throughout the country were practically idle; but with the revival of business in

CAR BUILDING INDUSTRY

1878-9 the car-works again became busy, and with the exception of a slight dullness in 1883-4, did a large and profitable business until 1893. The effect of business depression on car-building may easily be seen from the fact that in 1890, 103,000 freight-cars were built by 50 companies; in 1893 the output of 43 companies was only 51,216 cars; and in 1894 the 27 companies operating their plants turned out 17,029 cars. Fifteen companies that built 3,000 freight- and 300 passenger-cars in 1893 built not a single car in 1894. The increase in the total number of cars during the fiscal year 1894 was but 4,132, as against 58,854 in 1893. The rapid increase since that date may be judged from the fact that the capacity of car-building factories in the United States on 1 June 1903 was estimated as follows: Freight-cars, 270,200 per annum; passenger-cars, 2,700; street-cars (including electric and interurban), 17,850.

The average life of a freight-car being from 12 to 15 years, at least 125,000 cars must be built each year to repair the ravages of time; besides the cars required to make good the losses by accidents and for the increase in mileage and business. The transportation of various kinds

of products, such as live-stock, dressed meat, oil, timber, etc., has called into being cars especially adapted to each class of freight, so that scores of different kinds are now constructed to answer the demands of the shippers. Among the different makes may be named: flat or platform cars; the ordinary box-car, the gondola or coal-car, the hopper gondola coal-car, which has a gate in the bottom of the car for emptying the car without handling the contents; the hopper-car, which has a number of gates in the bottom for emptying the car rapidly; side dumping-cars, coke-cars, stock-cars especially prepared for different kinds of stock; horse express-cars, for transporting fine horses; furniture or vehicle-cars; refrigerator-cars; ventilated fruit-cars; special construction or repair-cars, and caboose-cars for trainmen. Steel-cars are used for the transportation of heavy material such as coal and ore. See STEEL CAR INDUSTRY.

Passenger-cars are divided into the ordinary passenger-car, the combination cars for baggage, mail, express and passengers, each style being of different construction; chair-cars, parlor-cars, dining-cars, combination parlor and café-cars; library- and buffet-cars; private cars containing business office, sleeping apartments, dining-room, kitchen, and observation room; and sleeping-cars. Street-cars are divided into electric, cable, horse, and parlor-cars.

According to the census of 1900 there were 65 establishments turning out steam-cars (some of which also constructed street railway cars); and 1,296 car-shops belonging to the various steam railways, and engaged in the building as well as the repairing of cars, making a total of 1,361 establishments, with a capital of \$207,904,125, employing 215,567 wage-earners and salaried officials, with wages and salaries aggregating \$120,798,002. The materials used cost \$171,281,760 and the value of products aggregated \$308,748,457.

The 1,296 establishments operated by railroad companies, reported an invested capital of \$119,580,273, or 57.5 per cent of the capital of the combined industry.

The 10 states leading in the construction and repair of steam railway cars in 1900 were: Pennsylvania, with a product of \$62,326,081; Illinois, with \$41,426,030; New York, with \$21,423,201; Indiana, \$19,248,999; Ohio, \$16,917,554; Michigan, \$14,253,707; Missouri, \$14,246,889; Texas, \$8,314,691; California, \$7,553,626; and Kansas, \$6,816,816. The aggregate value of the products for these States \$212,527,594, or 68.8 per cent of the total value for the United States. The products for the first five States aggregated \$161,341,865, or 52.3 per cent of the total value.

The constantly increasing traffic in this country rapidly absorbs the product of the car-shops, but there is also a foreign demand of considerable magnitude for American-built cars. This demand changes with the varying industrial conditions and commercial activity of the countries importing these products, as well as with the economic conditions existing in this country.

In 1890 and 1891 the value of exported cars exceeded the value in 1900. During the business depression which followed there was a marked decrease in the number of cars constructed, both for foreign and domestic use. The construction of freight-cars was the first to be affected. The number of passenger-cars constructed in this

country did not decrease materially until after the Columbian Exposition in 1893. The foreign demand and the exposition were potent factors in keeping many of the shops running during 1893. A year or two later the demand for freight-cars began to increase, and since 1897 the demand for both passenger- and freight-cars for foreign and domestic use has shown a constant growth. The exports for 1900, aggregating \$2,558,323, exceeded the average yearly exports from 1880 to 1890 by \$1,581,872; those from 1890 to 1900 by \$756,484; and the average for 20 years by \$1,169,178.

Among foreign countries importing American cars for steam railroads in 1900, Mexico led, purchasing to the amount of \$714,329. Egypt followed with imports aggregating \$401,151. The next six countries in the order of amounts expended are: France, \$280,939; Brazil, \$133,378; Great Britain and Ireland, \$124,585; Argentina, \$105,147; British Australasia, \$50,754; Cuba, \$79,723. No cars or parts of cars were exported to Asia or Africa in 1890, but in 1900 these exports to Asia were valued at \$33,492 and to Africa at \$405,895.

W. J. McBRIDE.

Vice-President American Car & Foundry Co.

Car'buncle, a very severe form of boil (q.v.). Also the lesion of malignant pustule, or anthrax (q.v.).

Carbuncle, a general term used to describe any red garnet when cut *en cabochon*. Pliny and other early writers apparently applied the name "carbunculus" indiscriminately to ruby, ruby spinel and garnet. The best usage at the present time confines it to the almandine garnet when cut *en cabochon*, that is, with a rounded convex surface. Usually such stones are hollowed out at the back and a piece of metal foil is inserted in order to lighten the otherwise too dense red color.

Carburet. See CARBIDE.

Carcagente, kār-kā-hān'tā, or **Carcaxente**, Spain, a town in the province Valencia, and 28 miles south by west of the town of that name, in a fertile and beautiful plain, on the right bank of the Jucar. The houses are well built and spacious, forming wide and clean streets. The principal square is large, lined with handsome dwellings and shops, and contains a spacious and elegant modern townhouse and prison. There are likewise a parish church, several chapels, two convents, a hospital, almshouse, cemetery, some primary schools, and an extensive palace of the Marquis of Calzada. In the environs are delightful promenades and gardens. It has a trade in grain, fruits, silk, woolen goods, and linen. Pop. 12,000.

Carcajou, kār'ka-joo, a French-Canadian name for the wolverine (q.v.), frequently misapplied to the wildcat and puma.

Carcanet, kār'ka nēt, a jeweled necklace or chain, an ornament referred to by Shakespeare, and by Tennyson in 'The Last Tournament.'

Carcano, Giulio, joo'lē ō kār-kā'nō, Italian poet: b. Milan, 1812; d. 1884. He wrote a narrative poem, 'Ida Della Torre,' while a student at Pavia (1834). His next work, 'Angiola Maria' (1839), had extraordinary success; it is a deeply sympathetic story of Italian family

life, and is regarded as the highest type of that class in Italian. In the same vein is the volume 'Simple Narratives' (1843). He wrote also 'Damiano, the Story of a Poor Family,' and other works. See Prina, 'Giulio Carcano' (1884).

Carcar, kār'kār, Philippines, a city on the northern coast of the island of Cebu, situated on the Bay of Carcar, 23 miles from the city of Cebu. It is near the head of the bay and on the road running along the eastern coast of the island. Pop. about 30,000.

Car'cass, in military language, an iron spherical case filled with combustible materials, which is discharged from a mortar, howitzer, or gun. It does not burst, but has three fuse-holes through which the flame rushes, firing everything within its influence. Carcasses are of considerable use in bombardments for setting fire to buildings, vessels lying in harbors, etc. They will continue to burn for 8 or 10 minutes, and are not even extinguished by water.

Carcassonne, kār-ka-sōn', France, capital of the department of Aude, on both sides of the river Aude and on a branch of the Canal du Midi, 53 miles south of Toulouse. It consists of an old and a new town, which communicate by a bridge of 12 arches spanning the river. The old town is surrounded by a double wall, part of it so ancient as to be attributed to the Visigoths, and is defended by a castle. Its streets are narrow, dirty, and desolate, forming a striking contrast to those of the new town, which is regularly built, and has many handsome modern houses. The boulevards are finely planted. The chief manufacture is that of woolen cloth, which is exported chiefly to the Levant, the Barbary states, and South America. There is also trade in wine, grain, brandy, fruit, and leather. Pop. 31,000.

Carchar'odon, an extinct genus of sharks of the Tertiary Period, nearly related to the modern white "man-eater" shark, but of gigantic size. The flat, triangular, sharp-edged teeth found commonly in the marl-beds of the Atlantic coast, are sometimes six inches wide, indicating that the animal was not less than 60 feet in length.

Carchemish, kār'kēm-īsh, an ancient city on the Euphrates, formerly thought to be the same as the Roman Circesium, but now is more generally located near Jerabis, a village on the west bank of the Euphrates. It was the northern capital of the Hittites; was once captured by Tiglath-Pileser I., and made to pay tribute by Asurnazirpal; but was not finally subdued by the Assyrians until taken in 717 B.C. by Sargon II., who deported the inhabitants and settled Assyrians in the city. In 608 B.C. it was captured by the Egyptian Pharaoh Necho. At this time Josiah, king of Judah, was killed (mentioned in 2 Chron. xxxv.); but the city was retaken by Nebuchadnezzar in 605.

Carcinoma. See TUMOR.

Card, Henry, English miscellaneous writer: b. Egham, Surrey, 1779; d. Great Malvern, 4 Aug. 1844. He was educated at Westminster School and Pembroke College, Oxford. In 1815 he was presented to the vicarage of Great Malvern, Worcestershire, and in 1832 to that of Darmington, Herefordshire. He was

CARD INDEX — CARDENAS

elected a Fellow of the Royal Society, 2 March 1820, and also a Fellow of the Royal Society of Antiquaries and of the Royal Historical Society. He was a prolific writer and some of his published works are: 'The History of the Revolutions of Russia' (2d ed. 1804); 'Historical Outline of the Rise and Establishment of the Papal Power' (1804); 'Thoughts on Domestic or Private Education' (1807); 'The Reign of Charlemagne, Considered Chiefly with Reference to Religion, Laws, Literature, and Manners' (1807); 'Literary Recreations' (2d ed. 1811); 'Beauford, or a Picture of High Life,' a novel (2 vols. 1811), etc.

Card Index. See **LIBRARY LABOR-SAVERS.**

Cardamine, kār'dā-mīn, a genus of plants of the natural order *Cruciferae*, containing about 60 species with a very wide distribution. They are herbaceous plants with usually pinnate leaves, white or lilac flowers of the usual cruciferous type, and the silique fruit which characterizes a section of the order. One of the best-known American species is the cuckoo-flower (*C. pratensis*), growing in wet places from Vermont to New Jersey, westward to Wisconsin, and northward. *C. hirsuta* is a common weed everywhere, varying in size, according to soil, from 6 to 18 inches in height. The leaves and flowers of this species form an agreeable salad. This species produces young plants from the leaves, all that is necessary being to place them on a moist grassy or mossy surface. These species were imported to this country from Europe. The indigenous American species are *C. rhomboides*, spring cress, and *C. rotundifolia*, mountain water-cress, common throughout the eastern part of the United States. *C. amara*, the bitter-cress, is not unlike the water-cress, but may be readily distinguished by its dark-colored anthers.

Cardamom, the capsule and seed of several species of plants of the order *Zingiberaceae*, perennial plants, growing in the East. The fruit is used as a stimulant and aromatic. Triangular capsules, from four to five lines in length, contain the seeds, which are of a brown color, a pleasant, aromatic smell, and a warm, pepper-like taste. The cardamoms known in the shops are produced by *Amomum angustifolium*, a Madagascar plant, *A. cardamomum*, a native of Sumatra, and other eastern islands. Those recognized in the United States pharmacopœia, called true or officinal cardamoms, and known in commerce as Malabar cardamoms, are the produce of *Elettaria (Alpinia) cardamomum*, a native of the mountains of Malabar and Canara.

The seeds of cardamom are widely employed in medicine as the basis of vehicles for carrying disagreeable drugs, and also as carminatives and digestants. The volatile oils of cardamom act like other volatile oils in stimulating peristalsis, thus expelling excess of intestinal gases, and they also increase the gastric and intestinal secretions.

Cardan, or **Cardano**, **Girolamo**, jē-rō'lā-mō kār dān or kār-dā'nō, Italian philosopher, physician, and mathematician: b. Pavia, 24 Sept. 1501; d. Rome, 21 Sept. 1576. He was educated from his fourth year in the house of his father. At 20 he went to Pavia to complete his studies, and after two years began to explain Euclid. He was subsequently professor of mathematics

and medicine in Milan (1534). His biographers differ with regard to his religious opinions, but he was lost in cabalistic dreams and paradoxes, and pretended to have a familiar demon from whom he received warnings, etc. All this excited the theologians against him, who even accused him of atheism, though the charge was without foundation. He believed so implicitly in astrology that he drew his own horoscope several times, and ascribed the falsehood of his predictions, not to the uncertainty of the art, but to his own ignorance. His two works, 'De Subtilitate Rerum,' and 'De Varietate Rerum,' contain the whole of his natural philosophy and metaphysics. Cardan wrote also on medicine, and his fame as a physician was very great. His highest claims to the gratitude of the learned rest on his mathematical discoveries. Cardan, it is said, was told that Tartaglia had discovered the solution of cubic equations, and obtained the secret from him by stratagem and under promise of silence, but published the method in 1545, in his 'Ars Magna.' The honor of giving his name to the invention has remained to him who first made it known, and it is still called the formula of Cardan. It is universally believed that Cardan discovered some new cases, which were not comprehended in the rule of Tartaglia; that he discovered the multiplicity of the roots of the higher equations, and finally the existence of negative roots, the use of which he did not, however, understand. All his works, to the number of more than 50, are contained in the standard edition of Sponius. (Lyons 1663).

Cardboard, a thick paper, or aggregation of paper or paper-stock, made by pasting several sheets of paper together and compressing the product between rollers. The finest cardboard, or Bristol board, such as is used for visiting-cards and in the arts, is so made of white paper only. It is known as three-, four-, six-, or eight-sheet board, according to the number of layers of paper. A cheaper grade of white cardboard is composed of coarse white paper for the inner layers, and a finer facing paper on the outside. Another variety of cardboard is that used by boxmakers, and is made from coarse brown paper glued and rolled, and faced with white or colored paper, or unfaced, according to the use to which it is to be put. A coarser grade yet is known as millboard. This is used by bookbinders for the covers of books, by boxmakers, and for other work in which strength is of more value than appearance. Fine qualities of millboard are also made to some extent. See **PAPER AND PAPER-MAKING.**

Cardenas, **Bernardino**, bër-nar-dē'nō kār'-dā-nās, Peruvian ecclesiastic: b. Chuquisæa, about 1595; d. Santa Cruz de las Sierra, about 1667. Entering the order of Franciscans he became a missionary among the Indians, being made bishop of Paraguay in 1640. On account of differences with the Jesuits he was twice expelled from his diocese. When Osorio, the governor, died in 1649, Cardenas was elected to fill the vacant position and immediately expelled the Jesuits from Asuncion. He was then deposed, imprisoned and excommunicated, but restored in 1662, and in 1666 made bishop of Santa Cruz de la Sierra. He wrote a defense of his career entitled 'Manuel y relacion de las Cosas del Reyno del Peru.'

CARDENAS — CARDIGAN

Cardenas, kār'dā nās, Cuba, a seaport in the northern part of the province of Matanzas, situated on Cardenas Bay. It is connected with Havana by rail, and has a large trade in sugar and molasses. On 11 May 1898 the Spanish shore batteries and gunboats at Cardenas attacked the United States vessels blockading the port, and in the engagement the United States torpedo-boat Winslow was disabled, and Ensign Worth Bagley (q.v.) and four sailors were killed.

Cárdenas y Rodriguez, José (hō-sā') **M. de**, Cuban poet and prose-writer: b. Matanzas, 1812; d. 1882. Many of his humorous sketches of Cuban life have been translated into French and published in the 'Revue des Deux Mondes.' Besides a good comedy, 'A Deaf Uncle,' he has written a collection of fables, some of which have been translated into English; and numerous poems.

Cárdenas y Rodriguez, ã rō drē'gāth, Nicolas de, nē'kō-lā dā, Cuban poet and novelist: b. Havana, 1814; d. 1868. His works comprise: 'Poetical Essays' (1836); 'Scenes from Life in Cuba' (1841); 'The Two Weddings,' a novel (1844); 'Diego de Velazquez,' a drama. He was also a regular contributor to periodicals.

Cardi, Lodovico, lō-dō-vē'kō kār'dē, sur-named CIVOLI, or CIGOLI, Italian painter and architect: b. 1559; d. 1613. He studied painting under Allori and S. di Titi, and afterward formed his style on the works of Andrea del Sarto and Correggio, but more especially on the noble and spirited productions of Baroccio at Florence. His architectural works, in which he followed Michael Angelo, possess considerable merit. His most celebrated picture is 'The Lame Man Cured,' which is in St. Peter's at Rome. Sacchi considers it entitled to hold the first place among the pictures in Rome, after 'The Transfiguration' of Raphael, and the 'St. Jerome' of Domenichino. His 'Martyrdom of St. Stephen,' executed for the convent of Monte Domini, and his 'Tobias Entertaining the Angel,' now in the Hermitage at St. Petersburg, are also noble paintings.

Cardia, the upper or cardiac orifice of the stomach, as distinguished from the intestinal opening or the pylorus.

Cardiac Medicines, medicines which act upon the heart. They may be roughly classified into those which stimulate the heart; heart tonics, which brace or tone the heart; and heart sedatives or depressants, which quiet or soothe the heart. To the first group belong ammonia, ether, camphor, and alcohol; to the second, digitalis, squills, lily of the valley, and strophanthus; and to the last, aconite. Several of these must be administered with great care.

Cardial'gia, an intense pain over the general heart region. It is usually due to stomach disturbance, heartburn, and is often accompanied by pains in the œsophagus. Heartburn is nearly always due to the presence of large amounts of gas, causing pressure. These gases usually accompany and cause an indigestion.

Cardiff, Wales (Welsh, *Caerdydd*, *Caerdyd*, the fortress or city on the Taff), a municipal and parliamentary borough and seaport, the capital of Glamorgan, and largest town of

Wales, is situated on the Taff, 1½ miles from its mouth in the estuary of the Severn, 170 miles west of London. The castle, situated on the north side of the town, was begun by Iestyn ap Gwrgan, the last Welsh prince, in the year 1080, and finished by Robert Fitzhamon, a kinsman of William the Conqueror, in 1110. In 1648 Cardiff Castle was besieged by Cromwell, who bombarded it for three successive days. It is at present a residence of the Marquis of Bute. The town of Cardiff, as the outlet for the mineral fields of South Wales, has grown up with great rapidity. In tonnage entered and cleared it is the third port in the United Kingdom, and in coal exported is the first. Among the public buildings, besides the parish churches, are included several places of worship belonging to the Baptists, Methodists, Independents, Roman Catholics, etc., a university college (for South Wales and Monmouthshire), established 1883, town hall, market hall, custom-house, law courts, militia barracks, theatre, county jail, literary and scientific institution, free library, and museum; a number of national, British, parochial, and other schools; an infirmary, almshouses, dispensary, etc. In recent years the streets have been improved by the corporation, and a water-supply brought from the Brecknockshire Beacons. The docks are extensive and well constructed, and further improvements to the port, including a new dock, tidal harbor, and a low-water pier, have been carried out. The docks, which were constructed by the Marquis of Bute at a cost of nearly \$20,000,000, cover an area of about 200 acres. Iron ship-building is carried on, and there are iron and other works on a large scale. In 1900 the number of ships cleared was 14,437, of 9,331,344 tons. The town (with Cowbridge and Llantrissant) returns one member to the House of Commons. Pop. (1850) 18,000; (1901) 164,420.

Cardiff Giant, the name given to a roughly carved statue of a man exhibited in various parts of the United States in 1870 as a "petrified man." It was originally carved in California from a block of gypsum and subsequently buried in Onondaga County, N. Y., near the village of Cardiff, and hence its name. It was alleged to have been accidentally discovered there in October 1869, and the general public, as well as some scientists, were at first deceived by its appearance. In very recent years the authors of the fraud confessed their share in the hoax.

Cardigan, James Thomas Brudenell, EARL OF, English general: b. Hambleton, 16 Oct. 1797; d. 28 May 1868. He was educated at Christ Church, Oxford, and was gazetted 6 May 1824, as cornet in the 8th Royal Irish Hussars, under the courtesy title of Lord Brudenell. His family influence and wealth in England procured for him a rapid promotion, and in a few years he had attained the rank of major. Lord Brudenell was next, 3 Dec. 1830, made lieutenant-colonel of the 15th Hussars. He was a member of the House of Commons from the period of his coming of age in 1818, until 14 Aug. 1837, when on the death of his father, he became Earl of Cardigan. After his regiment returned from India Lord Cardigan got himself into difficulties with the officers, who, one by one, had to sell out until the feeling of the regiment broke into mutiny

CARDIGAN — CARDINAL GROSBEEK

in what was known as the "black bottle quarrel." This quarrel arose in 1840, while Lord Cardigan's regiment was stationed at Canterbury. One of his officers, Capt. Reynolds, having caused wine to be placed on the table in a "black bottle," Lord Cardigan accused him of degrading the mess to the level of a pot-house. This led to angry words: Capt. Reynolds was placed under arrest, demanded a court-martial, but this privilege was withheld from him, and, as the public thought, unjustly. The excitement created by this affair and by his subsequent misunderstanding with another officer also of the name of Reynolds, had hardly subsided, when he fought a duel with Capt. Harvey Tuckett because this officer had censured his conduct in the *Morning Chronicle*. Capt. Tuckett was wounded, and Lord Cardigan tried before the House of Lords, but, although acquitted, public opinion was against him. His reputation, however, as an accomplished cavalry officer, and the satisfaction which the Duke of Wellington expressed in 1848, with the efficiency of the 11th Hussars' Regiment, which was under Lord Cardigan's charge, led to his promotion. On the outbreak of the Crimean war Lord Cardigan was raised to the rank of major-general, and appointed brigadier in command of the light cavalry brigade. This brigade constituted the celebrated "Six Hundred," whose charge at Balaklava will long be remembered as one of the bravest yet wildest feats, perhaps, ever told of in the history of war. On that occasion (25 Oct. 1854), Lord Cardigan is said to have received from Lord Lucan, his brother-in-law, an order to capture certain guns from the Russians. A mile and a half had to be traversed, under fire, before the enemy could be met, and the Russian forces stood in formidable array in every direction. The enterprise seemed hopeless. Cardigan, however, led on the charge, and actually took the guns, his men cutting their way through the infantry support and through the cavalry, and then back again, under the play of the Russian batteries, but with fearfully diminished numbers, the survivors not exceeding 150. As the hero of this daring exploit, Lord Cardigan was received with great enthusiasm on his return to England, and appointed inspector-general of the cavalry. The charges, however, subsequently alleged by the Crimean commissioners, tended to reduce the high estimate placed upon his services.

Car'digan, Wales, a seaport town, municipal and formerly a parliamentary borough, capital of Cardiganshire, on both banks of the Teifi, about five miles from its mouth, and 200 miles west-northwest of London. The most noteworthy buildings are St. Mary's Church, upward of 200 years old; several dissenting chapels, all fine edifices; the shire hall, Cardigan county school, the national and board schools, etc. Cardigan Castle, famous in Welsh history, stands at the foot of an eminence near the bridge, two circular bastions only now remaining of it. Brick, tile, and pottery works are here, and two iron-foundries are employed chiefly in the manufacture of agricultural implements. The salmon fishery is extensively carried on in the neighborhood, and many of the male population are engaged in the mercantile navy. Pop. (1901) 3,511.

Car'diganshire, Wales, a maritime county, having Cardigan Bay on the west, and on the land side chiefly Carmarthen, Brecknock, Radnor, and Montgomery; area, 443,387 acres. The northern and eastern parts are mountainous, the southern and western districts more level. The soil in the vales is chiefly peat, capable of growing either grain or grass, by the application of lime; the higher grounds consist of a light sandy loam, and the mountains are composed chiefly of clay-slate. The agricultural produce is comparatively small. Cattle, sheep, and wool are the staple commodities. The chief crops are barley and oats, very little wheat being grown. The lead-mines still yield largely, and zinc is obtained in several places. The coast-line is long, and many of the male population are sailors and fishermen. The principal towns are Cardigan, the county capital, Aberystwith, Lampeter, Tregaron, and Aberaeron. There are few manufactures. Pop. (1901) 60,237.

Cardinal von Widdern, Georg, gä örg kär'dē nal fön vid'dērn, German military historian: b. Wollstein, 12 April 1841. He entered the army in 1859: was engaged in the war of 1866 and the Franco-Prussian war; and was professor at the military school at Neisse. He retired in 1890 and has since lived in Berlin. He wrote 'Der Rhein und die Rheinfeldzüge' (1869); 'Belgien, Nordfrankreich, der Niederhein und Holland als Kriegsfeld'; 'Die Russischen Kavallerie-divisionen und die Armeeoperationen in Balkanfeldzüge' (1878); 'Das 76 Armee-korps und die 7 Kavallerie-division während ihrer selbständigen Operationen in Moselfeldzug bli Metz' (1886); and a number of works on military tactics.

Cardinal-fish, a fish of the family *Cheilodipteridae*, characterized by two dorsal fins, the anterior of which consists of from six to nine spines. The anal fin is short and has only two spines. The scales are large, and the color is often bright red, whence the name. They are especially abundant in the East Indian seas; but several species are found in America, one of which is known as "king of the mullets."

Cardinal Flower, the name commonly given to *Lobelia cardinalis*, because of its large, very showy, and intensely red flowers. It is a native of America, growing on the muddy banks of streams. Stems two to three feet high, the flowers in racemes. It admits of cultivation, and is much prized abroad, particularly in England.

Cardinal Grosbeak, or **Red-bird**, a large song-bird (*Cardinalis cardinalis*) of the finch family, very numerous in the southern United States. It is particularly distinguished for its loud, clear, sweet song, whose quality makes it popular as a cage-bird. It is a brilliantly red bird, with a vermilion head, its bill surrounded with a small band of glossy black, and having the long feathers of the crown erected into a conical crest. The female builds her nest, which is made of twigs, grasses, roots, etc., in bushes, and frequently breeds twice in a season, her bluish, brown-spotted eggs numbering about four. This bird is migratory only to a small degree, moving southward only along the northern limits of its range, and occasionally passing the winter in village gardens even in New England.

CARDINAL POINTS—CARDINALS

Cardinal Points, the four intersections of the horizon with the meridian and the prime vertical circle. They coincide with the four cardinal regions of the heavens, and are, of course, 90° distant from each other. The intermediate points are called collateral points. See COMPASS.

Cardinal Virtues, in morals, a name applied to those virtues to which all the rest are subordinate, or which comprehend all the others. The distribution of the virtues, which lies at the foundation of this notion, had its origin in the old Grecian philosophy, and the same number is found here as in the elements of nature. These principal virtues, as enumerated by Plato, are prudence, temperance, fortitude, and justice. The first three seem to relate to the duties of man toward himself, and to correspond with the triple division of the soul into the intellectual, the irrational (the seat of the sensual desires), and the seat of the affections. Justice either relates to our duties to others (God and men), or is the union of the three first virtues. This division appears to be peculiar to the old Pythagoreans. Aristotle divided them still farther. The Stoics, too, made the same division in their system of morals, and Cicero introduced it into his 'De Officiis.' Plotinus and many New Platonists divide the virtues into four classes—civil or political, philosophical or purifying, religious, and lastly, divine or pattern virtues: a division coinciding with the rest of his philosophical views. The influence of the ancient philosophers has made these cardinal virtues also a part of the Christian code. Some add to them the three "Christian virtues," faith, hope, and charity, and call the former philosophical. The imagination of artists has represented the cardinal virtues under sensible images. In modern times this division is regarded as useless in treating of ethics.

Cardinals, College of, an ecclesiastical body consisting of the highest dignitaries in the Roman Catholic Church. The name cardinal is applied to one of the principal advisers of the supreme pontiff as it is to the principal virtues or to the four points of the compass; etymologically cardinal is from *cardo*, linage, pivot, tenon, point around which anything turns. In the 11th century the term cardinal appears to have come into use to designate the "bishops collateral to the Pope," those whose sees are in the neighborhood of Rome, and to the clergy of the principal churches, parishes or *tituli* of the city; but probably *cardinalis* was at first said of a principal church rather than of its ministers. Nor was the term cardinal at first restricted to designation of churches and their clergy in Rome and its vicinity; for a long time, even down to 1585, date of the bull *Postquam* of Sixtus V., which forbade the application of the term to any but members of the sacred college, it was customary to call the ecclesiastics attached to mother-churches or to all cathedrals even, *cardinales*. The use of the word *cardo*, or its equivalent to express the relation of a bishop to his clergy and people, is very ancient: Saint Ignatius, bishop of Antioch (d. about 202), speaks of the bishop of a church as the pivot on which it turned. Till the issuance of the bull *Postquam* the title of cardinals was currently bestowed, but not by authority from the centre, upon the clergy of cathedral chapters in

countries beyond the Alps, as those of the sees of Bourges, Metz, Cologne, Compostella, and other cities in Germany, Spain, and France; even in Italy the same usage was common; for it was with the name *Cardinalis* as with the name *Papa*: they both were originally applied to church dignitaries, to pastors, and church officers generally; later their application was restricted.

Ever since the reign of Nicolas II. the cardinals have possessed the privilege of electing the Pope. The decree of Pope Nicolas (1059) provides that on the death of the Pope the cardinal-bishops shall assemble in council and then the rest of the sacred college shall join them. In naming the Pope the college must take into account the choice of the clergy and people; only in case no Roman priest is found eligible in every way, shall the choice fall upon one that is not a Roman. In the 12th century the sacred college comprised seven cardinal-bishops of the "suburbicarian" churches, Ostia, Rufina, Porto, Albano, Tusculum, Sabina, and Palestrina; the cardinal-priests were 28, and were the rectors of as many churches in the city; there were 18 cardinal-deacons, of whom 14 belonged to the clerical staff of churches in the city, and 4 to the papal court or household. The members of the sacred college are yet styled by the titles of churches in the city, but are no longer in any sense ministers of those churches or parishes. And, like other church offices and church dignities the cardinalate became an object of ambition or of cupidity; popes bestowed the honor, princes and popes bestowed the dignity and the emoluments of episcopal and primatial sees, with the cardinalate annexed, upon minors and infants; thus, John de Medici was raised to the cardinalate at the age of 14 years, being already vested with a number of highest church dignities; and as late as 1740 a prince of the house of Bourbon was archbishop of Toledo and cardinal at the age of eight years.

According to the present constitution of the sacred college that body consists of 70 members—though very rarely indeed, if ever, are all the places filled. Of the 70 six are cardinal-bishops, and they are the ordinaries of sees in the neighborhood of Rome; 50 cardinal-priests, and 14 cardinal-deacons. In the year 1903, the cardinal-bishops numbered five, all Italians; the cardinal-priests 52, and of these four were Spaniards, seven were Frenchmen, one German, one Belgian, one Pole, one American, three British and Irish, two Austrians, two Hungarians, one Bohemian; the rest were Italians. There were eight cardinal-deacons, among them one German and one Spaniard; the rest were Italians.

The scarlet hat is distinctive of the cardinalitial dignity, and above the double cross in the arms of an archbishop who is a cardinal is the figure of the scarlet hat with its tasseled pendants. The gown of the cardinal is scarlet (*purpura*, commonly rendered purple, but our "purple" in the language of the ritual is violet *violaceus*). Hence "to receive the hat" means to be made a cardinal; and to aspire to the purple is to aim at the cardinalitial dignity. Etiquette requires that a cardinal be addressed as Eminence; in English usually "your eminence," and every cardinal is *eminentissimus*. A bishop or archbishop who is a cardinal, uses such a formula as the following in official instruments

CARDING — CARDS

(the example is taken from the approbation of a book by an archbishop of Mechlin or Malines in Belgium) :

"Engelbert, by the divine mercy, cardinal-priest of the holy Roman Church, of the title of Saint Bartholomew in the Island, archbishop of Mechlin, primate of Belgium," etc.

Carding, the process which wool, cotton, flax, etc., are made to undergo previous to spinning, to lay the fibres all in one direction, and remove all foreign substances. The card formerly consisted of a number of iron teeth arranged in a piece of leather of various lengths, and the material was combed by hand. For many years this work has been done by machinery, the cards being fine, long teeth fixed on leather strips called card-clothing, which are arranged on a series of cylinders so placed that the material is carried from one to another, until removed by still another and much smaller cylinder called the doffer, from which it is stripped by a moving comb, and then by a series of rolls is delivered in the form of a ribbon into a can, when it is ready for the drawing-frame, on which it is prepared for spinning.

Cardioid, a heart-shaped curve. It is produced by drawing a great number of chords from a single point of the circumference of a circle, prolonging each beyond the further crossing of the circumference to a distance equal to the diameter of the circle, and joining the free ends by a smooth curve. It is a special case of the limaçon, in which the extension of the chords is of any uniform length. The limaçon was invented by Pascal.

Carditis, kâr-dî'tis, an inflammation of the heart. The word is not now used, since more definite terms are accessible to designate particular types of inflammation. Thus myocarditis is an inflammation of the heart muscle, endocarditis, of the lining membrane, the endocardium; pericarditis, of the external membrane, the pericardium.

Cardona, kâr-dô'nâ, Spain, a town in the province of Barcelona, on the right bank of the Cardoner, 50 miles north-northwest of Barcelona. It has a castle. In its vicinity is a hill of rock salt 500 feet high, which affords inexhaustible supplies of salt. Pop. (1887) 3,708.

Cardoon', a garden vegetable (*Cynara cardunculus*), of the natural order *Compositæ*. It so closely resembles the artichoke (*Cynara scolymus*) that some botanists consider the two species merely as horticultural varieties. The plant, which is a native of southern Europe, is a thistle-like, tender perennial which is cultivated as an annual. Seed is usually sown in spring in a hotbed; the young plants are transplanted to the rich soil of the garden about four feet apart each way, and kept cleanly cultivated until the leaves are nearly full grown, when the plant is tied up, covered with straw and earth, to blanch for two or more weeks. The thick leaf-stalks and the mid-ribs are the parts desired. In America the plant is not very popular except with the foreign population.

Cards, pieces of cardboard, oblong in shape, bearing certain figures and spots; specifically, playing-cards used in various games of chance and skill. Playing-cards are probably an invention of the East, and some assert that

the Arabs or Saracens learned the use of cards from the gypsies and spread them in Europe. The course that card-playing took in its diffusion through Europe shows that it must have come from the East, for it was found in the eastern and southern countries before it was in the western. The historical traces of the use of cards are found earliest in Italy, then in Germany, France, and Spain. The first cards were painted, and the Italian cards of 1299 are found to have been so. The art of printing cards was discovered by the Germans between 1350 and 1360. The Germans have, moreover, made many changes in cards, both in the figures and the names. The lanzknechtsspiel, which is regarded as the first German game with cards, is a German invention. Of this game we find an imitation in France, in 1392, under the name of lansquenet, which continued to be played there till the time of Molière and Regnard, and perhaps still longer. The first certain trace of card-playing in France occurs in the year 1361, and Charles VI. is said to have amused himself with it during his sickness at the end of the 14th century. The modern figures are said to have been invented in France between 1430 and 1461. It has been said that cards were known in Spain as early as 1332; but what is certain is that card-playing must have become prevalent in the course of the century, seeing it was prohibited by the king of Castile, John I., in 1387. Mr. De la Rue, the most extensive manufacturer of cards in England, obtained in 1832 a patent for various improvements in manufacture. The figures on cards had been generally produced by the outlines first being printed from copper plates, and the colors then filled in by stencilling. Mr. De la Rue's process was to print them from colored types or blocks exactly in the same way as calico-printing, but all the colors being in oil.

As early as the 15th century an active trade in cards sprung up in German, and was chiefly carried on at Nuremberg, Augsburg, and Ulm, the demand from France, England, Italy, Spain, and other countries producing great prosperity among the manufacturers. In England the manufacture of cards flourished especially under Elizabeth. But no sooner had cards come to be generally used in Europe, than they were prohibited by several governments, partly from moral considerations, the first games being games of chance; partly from considerations of political economy, as in England, where the importation of foreign cards was considered injurious to the prosperity of home manufacturers. The prohibition, however, only tended to increase the taste for cards. In England, under Richard III. and Henry VII., card-playing grew in favor. The latter monarch was very fond of the game, and his daughter Margaret was found playing cards by James IV. of Scotland, when he came to woo her. The popularity which cards gradually obtained in England may be inferred from the fact that political pamphlets under the name of "Bloody Games of Cards," and kindred titles, appeared at the commencement of the civil war against Charles I. One of the most striking publications of this kind was one in 1660 on the royal game of ombre. Pepys, in his "Diary," under the date of 17 Feb. 1667, states that on Sabbath evenings he found "the Queene, the Duchesse of York,

and another or two, at cards, with the rooms full of ladies and great men."

The modern pack of cards, used in most of the familiar games, is 52 in number, containing four suits; clubs and spades (black), and hearts and diamonds (red). Thirteen cards compose a suit, consisting of king, queen, knave or jack, and ten pip-cards ranging in number of spots from one (ace) to ten. The figures of the four suits are supposed to have been originally intended for symbolical representations of the four great classes of men, and the names attached to these figures in England arose from a misapprehension of the names originally assigned to them. Thus, by the hearts are meant the gens de cœur (cœur), the choir-men or ecclesiastics, and hence these are called copas, or chalices, by the Spaniards; whose word espada, sword, indicating the nobility and warriors of the state, has been corrupted into the English spade. The clubs were originally trèfles (trefoil leaves), and denoted the peasantry; while the citizens and merchants were marked by the diamonds (carreaux, square tiles). The word knave (German, knab, boy), was used, of course, in its older sense of servant, or attendant on the knights. The natural rank of the cards in each suit is, king highest, and so on down to ace lowest; but in many games this rank is varied, as in whist, where the ace is put highest of all, above the king; in écarté, where it is put between the knave and the ten; and in bézique, where it is made the highest, but where the ten is put between it and the king; in quadrille, the rank of some of the cards is variable in every hand. Sometimes the pack of cards is reduced to 32, by excluding the six, five, four, three, and two of each suit; it is then called a "piquet pack." An immense variety of games may be placed with cards, some involving chance only, others combining chance and skill, the best furnishing intellectual amusement. There are round games, in which any number of persons may join, as poker, hearts, loo, etc.; games for four persons, as whist, in its different forms, and euchre; for two, as piquet, écarté, bézique, cribbage, and penceuche, closely resembling bézique, and at present much played in the United States; and there is one game, solitaire, played in many ways, at which a single person often finds both restful diversion and pleasant occupation for the mind.

Carducci, or **Carducho**, **Bartolommeo**, hār-tō-lōm-mā'ō kār-doo'chē or kar-doo'chō, Italian artist: b. Florence, 1560; d. Madrid, 1608. He studied in Rome as a pupil of Zuo-chero, and later went to Spain, where he was a favorite of Philip III. Among his best works are 'Descent from the Cross,' and the 'Adoration of the Magi.'

Carducci, kār-dō'chi, **Giosuè**, Italian poet and philologist: b. Valdicastello, Tuscany, 27 July 1836. He was made professor of Italian literature in the University of Bologna in 1861. He had previously written essays on the history of literature; and a small volume of lyrics, 'Rimes' (1857). But his poetical genius is better shown in 'Inno a Satana' (1863); and 'Odi Barbare'; 'Nuove odi Barbare'; and 'Terze odi Barbare.' His employment of original poetic forms in the 'Odi Barbare' series has aroused much literary discussion. In criticism Carducci has published 'Studii letterarii'

(1875); 'Bozetti critici e discorsi letterarii' (1875). See Chiarini, 'I critici italiani e la metrica delle Odi Barbare' (1878).

Carducci, or **Carducho**, **Vincenzo**, vīn-chēnt'sō, Italian artist: b. Florence, 1568; d. Madrid, Spain, about 1638. He was a brother of the preceding and was patronized by both Philip III. and Philip IV. of Spain, where his most important works are to be found. He was the author of 'Dialogos de las excelencias de las pintura' (1633).

Carduus, kār'dū-ūs, a genus of plants belonging to the natural order *Compositae*, resembling the thistles, common along the Mediterranean. They are almost all troublesome weeds, though some of them are said to possess medical properties which make them useful in fevers. Among the more common of them are the arvensis (corn-thistle, way-thistle, or creeping-thistle), which has strong fleshy roots extending underground, and difficult of extirpation; and *C. lanceolatus* (spear-thistle), which, both from its size and rough feeding, is a great robber of the soil, but from being only a biennial is more easily managed.

Cardwell, **John Henry**, English clergyman: b. Sheffield, England, 20 June 1842. He was educated at Caius College, Cambridge, was ordained in the Established Church 1865, and was incumbent of St. Andrew's, Fulham, 1868-91. Since 1891 he has been rector of St. Anne's, Soho, London, and has been prominent in municipal politics and civic reforms. He has published 'The Story of a Charity School'; 'Two Centuries of Soho'; 'Men and Women of Soho, Famous and Infamous.'

Care Sunday, sometimes taken to be the Sunday immediately preceding Good Friday; but generally used to signify the fifth Sunday in Lent. Same as Passion Sunday.

Careening, the process of heaving a vessel down on one side by applying a strong purchase to the masts, so that the bottom may be cleansed by breaching, that is removing by means of fire any growth which adheres to it, or any other necessary work effected. A half careen may take place when it is not possible to come at the bottom of the whole ship. Very few ships are now careened, more especially since the introduction of copper sheathing.

Carême, **Marie Antoine**, mā-rē ān-twān kà rām, French cook: b. Paris, 8 June 1784; d. there, 12 Jan 1833. He wrote 'Le pâtissier pittoresque' (2d ed. 1842); 'Le maître d'hôtel française' (2d ed. 1842); 'Le pâtissier royal parisien' (1828); 'L'art de la Cuisine française aux XIX. siècle' (1833).

Caret, kārā', a turtle. See **HAWKSBILL**.

Carew, ka-roo', **Richard**, English antiquarian and poet: b. East Antony, Cornwall, 17 July 1555; d. there, 6 Nov. 1620. He was a member of the House of Commons, high sheriff of Cornwall in 1586, and the author of a much valued 'Survey of Cornwall' (1602), and an English translation of a portion of Tasso's 'Jerusalem Delivered.'

Carew, **Thomas**, English poet; b. 1598; d. 1639. He was educated at Corpus Christi College, Oxford. Cultivating polite literature in the midst of a life of affluence and gaiety, he was the subject of much eulogy by Ben Jonson,

Davenant, and other writers of the period. In him was exhibited the not unusual transformation of the courtly and libertine fine gentleman into the repentant devotee. Carew is coupled with Waller as one of the improvers of English versification. The first collection of his poems was printed in 1640, and the last in 1824. His elegant masque of 'Cœlum Britannicum' was printed both in the early edition and separately in 1651, and the whole were included in Chalmers' 'British Poets.' Carew was much studied by Pope, and Dr. Percy also assisted to restore him to a portion of the favor with which he has come to be regarded. Specimens both of the sublime and the pathetic may be found in his works; the former in his admirable masque, and the latter in his epitaph on Lady Mary Villiers.

Carex, kār'čks, a genus of plants, belonging to the natural order *Cyperaceæ*, or sedges, and containing numerous species, which are found in all parts of the world where vegetation can exist, on the driest upland as well as the wettest marsh. The plants are perennial, often creeping, with sharp-keeled leaves and solid triangular stems. The flowers are without perianth and unisexual, being grouped in spikelets. The male flowers have usually three stamens, the female having a single style with three stigmas. The number of known species is above 2,500, and of these the United States has nearly 300. Hardly any of them have any agricultural value, but *C. arenaria*, the sand-sedge, is of use in binding the sand on many sea-shores. In parts of the United States a poor quality of hay is made from some of the sedges. *C. japonica variegata* is an elegant variety cultivated by florists.

Ca'rey, Henry, English composer and poet: b. London, 1666; d. there, 1743. He is supposed to have been a natural son of George Saville, Marquis of Halifax. His first instructor in music was a German, named Linnert, but he was afterward more thoroughly trained under Rosengrave and Geminiani. He was inexhaustible in the invention of new, pleasing, and often deeply pathetic melodies, to which he not unfrequently furnished the words. His 'Sally in Our Alley' is still a well-known song. He has also been said to be the author of 'God Save the King,' but this appears to be doubtful. He supported himself by public and private teaching, but his whole life was a continued struggle with poverty, and it has been said that at last, in a fit of despair, he committed suicide (1743). His collected songs were published in 1740. Among other works are: 'Teraminta' (1732) and other operas; 'Chrononhotonthologos,' "the most tragical tragedy ever yet tragedized" (1734), a burlesque; 'The Wonder, or An Honest Yorkshireman' (1735); and 'The Dragon of Wantley' (1737). His dramatic works were published together in 1743.

Carey, Henry Charles, American political economist: b. Philadelphia, 15 Dec. 1793; d. there, 13 Oct. 1879. He was the eldest son of Mathew Carey, and in 1814 became a partner in his father's bookselling and publishing firm, where he continued until 1835. In that year he published an essay on 'The Rate of Wages,' which he afterward expanded into 'The Principles of Political Economy' (1837-40). His other important works are: 'The Credit Sys-

tem in France, Great Britain, and the United States' (1838); 'The Past, the Present, and the Future' (1848); 'The Principles of Social Science' (1858-9); 'Letters on Political Economy' (1860 and 1865); 'The Unity of Law' (1872). Originally a free-trader, he became an advocate of protection on the ground of temporary expediency; held that the growth of population was self-regulating; and was opposed to the theories of Ricardo and others on the law of diminished returns from the soil and on rent. He was also opposed to any arrangement on the subject of international copyright. Some of his works have been translated into other languages, and his writings have had considerable influence on economical speculation.

Carey, James F., American socialist leader: b. Haverhill, Mass., 19 Aug. 1867. He received a common school education and learned the shoemaking trade. In 1895 he was chairman of a convention at Boston, which amalgamated three national organizations of shoemakers into one union. In 1894 he was one of the leaders in the agitation of the unemployed on Boston Common, and the governor appointed him a commissioner of the unemployed, but he was not confirmed. He was later elected president of the Haverhill common council. In 1898, 1899, and 1900 he was elected to the Massachusetts House of Representatives, twice defeating a combination of the Democratic and Republican parties. He was the first Socialist ever elected to political office in New England.

Carey, Mathew, Irish writer and bookseller: b. Dublin, 28 Jan. 1760; d. Philadelphia, 16 Sept. 1839. After a varied experience, including imprisonment for offending publications, he came to the United States in 1784, and in Philadelphia began to publish the *Pennsylvania Herald*. A few years later he became a bookseller, and an extensive publisher. The best known of his political writings was his 'Olive Branch' (1814). It was an effort to promote harmony among political parties during the War of 1812. It passed through 10 editions. In 1819 he published his 'Irish Vindications,' and in 1822, 'Essays on Political Economy.'

Ca'rey, Rosa Nouchette, English novelist: b. London. She began writing novels in 1868, and her fictions, in which the literary element is not a very strong feature, have been very popular with the average, uncritical reader who demands only to be entertained and cares little or nothing for literary style. They include 'Wee Wife' (1869); 'Nellie's Memories' (1868); 'Barbara Heathcote's Trial' (1871); 'Robert Ord's Atonement' (1873); 'Wooded and Married' (1875); 'Heriot's Choice' (1879); 'Queenie's Whim' (1881); 'Mary St. John' (1882); 'Not Like Other Girls' (1884); 'For Lillias' (1885); 'Uncle Max' (1887); 'Only the Governess' (1888); 'Basil Lyndhurst' (1889); 'Lover or Friend' (1890); 'Sir Godfrey's Grand-daughters' (1892); 'Men Must Work' (1892); 'The Old, Old Story' (1894); 'Mrs. Romney' (1894); 'The Mistress of Brae Farm' (1896); 'Other People's Lives' (1897); 'Mollie's Prince' (1898); 'Twelve Notable Good Women'; 'My Lady Frivol' (1899); 'Rue with a Difference'; 'Life's Trivial Round' (1900); 'Herb of Grace' (1901); 'The Highway of Fate' (1902).

CAREY — CARIB

Carey, William, English Orientalist and missionary: b. Paulerspury, Northamptonshire, 17 Aug. 1761; d. Serampore, India, 9 June 1834. He was early apprenticed to a shoemaker, and continued to work at his trade till he was 24. With what assistance he could procure he acquired Latin, Greek, and Hebrew, and studied theology. In 1786 he became pastor of a Baptist congregation at Moulton, and in 1787 was appointed to a similar situation in Leicester. In 1793 he sailed for the East Indies as a Baptist missionary, but became overseer of an indigo factory. He studied languages and natural history, and collected a rich store of Oriental knowledge. In 1800, in conjunction with Marshman, Ward, and others, he founded the missionary college at Serampore; the year following he became professor of Sanskrit, Bengali, and Mahratta at the newly erected Fort William College, Calcutta. In Serampore he had a printing-press for more than 40 different Indian languages, and issued various translations of the Scriptures. His first work was a Mahratta Grammar. It was followed by other works, including a Bengali 'Lexicon,' in which he was assisted by Felix Carey, his son. Under his direction the whole Bible was translated into 6, and the New Testament into 21 languages or dialects of Hindustan; and considerable progress was made with the translation of the whole Scriptures into Chinese. He also edited Shroeder's Lexicon of the Thibetan language, and Roxburgh's 'Flora Indica,' in which a genus of plants which he discovered is named after him, *Caryya*. He established an agricultural society at Calcutta, and a botanical garden, at his own expense, at Serampore. See his 'Life' by Dr. G. Smith (1885).

Cargill, kār'gīl, Donald, Scotch covenanting preacher: b. Rattray, Perthshire, about 1619; d. Edinburgh, 27 July 1681. He was educated at Aberdeen and St. Andrews, and became minister of the Barony Church in Glasgow in 1655. At the Restoration he refused to accept collation from the archbishop, and was exiled beyond the Tay. In 1679 he took part in the battle of Bothwell Bridge, where he was wounded, but succeeded in escaping to Holland. In 1680 he published, along with Richard Cameron, the 'Sanquhar Declaration.' In September of the same year he formally excommunicated King Charles II., Duke of York, and other great personages. After avoiding pursuit for several months, in May 1681, he was captured, and at Edinburgh tried and sentenced, and 27 July was beheaded.

Carhart, Henry Smith, American scientist: b. Coeymans, N. Y., 27 March 1844. He was graduated at Wesleyan University in 1869, and since then has taught physics and chemistry. Since 1886 he has been professor of physics at the University of Michigan. He has written 'Primary Batteries'; 'University Physics'; 'Electrical Measurements'; and other books.

Carheil, Étienne de, ā-tē-ēn dē kā-rā-ē, French Jesuit missionary in North America: d. after 1721. He labored for more than half a century among the Canadian Hurons and Iroquois, and was long stationed at Michilimachinac.

Ca'ria, in ancient geography, the country forming the southwest corner of Asia Minor,

bounded on the north by Lydia or Mæonia, from which it was separated by the Mæander; on the east by Phrygia, on the southeast by Lycia, and on the south and west by the Mediterranean. Some confusion, however, exists in regard to its boundaries. Part of it was settled by Greek colonies of Ionians and Dorians, who dispossessed the original inhabitants. It was included in the dominions of Cræsus, king of Lydia, and on his overthrow by Cyrus was transferred to the Persian monarchy, under whose protection a dynasty of Carian princes was established. Halicarnassus was the residence of these sovereigns, among whom were the two celebrated queens, the first and second Artemisia. The progress of the Roman conquests ultimately extinguished the independence of Caria, and about 129 B.C. it was incorporated in the Roman province of Asia.

Cariaco, kā-rē-ā'kō, Venezuela, a seaport in the state of Bermudez, situated to the east of the Gulf of Cariaco, near the mouth of a river of the same name, adjoining a large plain, covered with plantations. Its trade is chiefly in cotton and sugar. The Gulf of Cariaco is 38 miles long, from 5 to 10 broad, from 80 to 100 fathoms deep, surrounded by lofty mountains. Pop. 7,000.

Cariacou, kār'ī ā koo, the name given to American deer of the genus *Cariacus*, found in all parts of North America up to lat. 43° N. It is smaller than the common stag, and its color varies with the seasons from reddish-brown to slaty-blue.

Cariama, sā-rē-ā'mā, a bird (*Cariama cristata*), a native of Brazil and Paraguay, where its loud scream is a familiar sound on the campos, and where it is domesticated and trained to guard fowls. With an allied Argentine bird (*Chunga burmeisteri*) it constitutes a family (*Cariamidae*) of great zoological interest, combining as it does characters of the bustards, caracara eagles, and cranes, with each of which it has been at times associated.

Carib, kār'īb, a native American race which attained its highest development in the West Indies. Originating in the valley of the Orinoco, this race spread along the coasts, northward and southward, to a great distance, and especially from island to island of the Lesser and Greater Antilles and the Bahamas. At the time of the discovery of America its language was spoken, with dialectic variations, from the coast of Florida to lower Brazil,—wherever large canoes could carry the swarming, warlike tribes. The Caribs were the Vikings of South America. The race name survives in "Caribbean" Sea, "Caribbee" Islands, the word "cannibal," etc.; the race itself is still well represented at various points in South America. In the West Indies, however, the large native population disappeared rapidly after the Spanish conquest. Caribs and other tribes of the same stock (Arawaks, Lucayos, Boriqueños, etc.) either succumbing under the new conditions or losing their distinctive characteristics by blending with Europeans and Africans. Surviving groups of West Indian Caribs may be studied to-day in the island of Dominica. A few remained in Martinique and St. Vincent up to the time of the volcanic eruptions in 1902. Great Britain deported 3,000

CARIBBEAN SEA

Caribs from St. Vincent to the island of Ruatan in the Gulf of Honduras in 1796; thence they migrated to the Central American coast, where their numerous descendants have become a not inconsiderable element in the population of the mainland. In the 'Proceedings of the American Association for the Advancement of Science' (1902, Vol. LI.), Mr. J. Walter Fewkes of the Bureau of American Ethnology calls attention to the different characteristics which the Caribs displayed in different circumstances and localities. Thus the natives in the Bahamas, Cuba, Haiti, and Porto Rico were mild, agricultural people who had lost in vigor, while gaining a rudimentary knowledge of the arts of peace, by their sedentary life. On the other hand, constant incursions from the home of the race (the Orinoco region in Venezuela) kept alive the savage customs and ferocious spirit of the Caribs of the Lesser Antilles. Such incursions took place even after the date of the Spanish settlements. The houses of the more peaceful Carib communities did not differ greatly from those of the peasantry in the same regions at the present time. In lieu of clothing, Carib men and girls covered their bodies, as well as their faces, with paint, to protect them from the bites of insects and the heat of the sun. A woven cloth of palm fibre, called *nagua*,—a breech-cloth with long ends,—was worn by the chiefs and the married women. For purposes of decoration, and to distinguish members of one family or community from those of another, designs of animals and plants were painted on the body. Their social organization closely resembled that of the North American Indians, the unit of organization being the clan, ruled by a *cacique* (chief). Combinations were sometimes formed by a number of *caciques* for mutual defense, and extensive territories were subjected to the control of the more ambitious leaders. Among the insignia of the *cacique's* rank were the gold disk called *guarim*, worn on his breast, and a stone amulet tied to his forehead. His numerous wives were practically slaves. *Ex officio*, he was a member of the priesthood. Columbus at first received the impression that the Caribs lacked spiritual insight; longer sojourn among them, however, convinced him that they worshipped many supernatural beings whom they represented by idols, called *zemis*; they had temples for this purpose, in which rude idols were set up to be consulted as oracles by the priests. It is probable that belief in a future life, although not universally held, as some authorities assert, was generally taught by the priests; and it is quite certain that the latter possessed great influence, being physicians to the people as well as ministers to the *zemis*.

Like other savage races of the region from which they came, the Caribs were anthropophagi; yet the evil prominence given to them through the coining of the word *cannibal* (a Latinized form of *Carib*) is not wholly merited. The discoverers, finding a great number of human skulls in the Carib houses, jumped to the conclusion that each skull was the trophy of some revolting feast. In point of fact, the Caribs, being ancestor-worshippers, preserved these relics in honor of defunct members of their family.

MARRION WILCOX,
Authority on Latin-America.

Caribbean (kă-rĭ-bĕ'an) **Sea**, a part of the Atlantic Ocean occupying a basin 750,000 square miles in area, bounded by South and Central America, and the Greater and Lesser Antilles. Its perimeter is wholly mountainous. Mountain folds (continued in submarine ridges from the Greater Antilles to Honduras) mark its limits on the north and south; but the volcanic chain of the Lesser Antilles rises on the east, and the volcanoes of Central America in the remote past formed a wall separating it from the Pacific on the west. Separating it from the Atlantic are steep submarine ridges, of which the Lesser Antilles are the summits. A portion of the broad equatorial stream, which flows from east to west, from the coast of Africa to that of Brazil, enters the Caribbean between the islands at the southern end of the Antillean chain: the waters of this sea, therefore, move from east to west and northwest, and seek an exit through the Yucatan Channel. But the latter is too small to allow an outflow equal to the inflow into the Caribbean; so that, after the trades have forced the equatorial water into the Caribbean basin, it must remain there a considerable length of time, thus becoming superheated, before it passes into the Gulf of Mexico, where, owing to similar differences between the rate of inflow and outflow, the water becomes still more superheated before passing through the Florida Straits as the Gulf Stream. The main westerly current in the Caribbean, after passing through the Banks Strait, between the Mosquito Reef and Jamaica, is joined by the current of the Windward Channel. The trade-winds, blowing with a steady velocity across the Caribbean region, from east to west, make the surface of this sea much rougher than that of the Gulf of Mexico; they mitigate the tropical heat at all points where their influence is felt; and the moisture they bring from the Atlantic is precipitated in the form of abundant rains against the eastern slopes of the mountains, both on the islands and the mainland. Hence the distinction between "windward" and "leeward" regions, insisted upon especially in the West Indies. The Gulf of Mexico, sheltered behind the Antilles and Yucatan, is practically a "leeward" expanse; but the summer climate of Texas and the great plains is somewhat modified by Caribbean trade-winds.

Recent studies of the Caribbean basin have disclosed its interesting submarine topography—"a configuration which, if it could be seen, would be as picturesque in relief as the Alps or Himalayas. Nowhere can such contrasts of relief be found within short distances. Some deeps vie in profundity with the altitudes of the near-by Andes. . . . Some of the depressions, like the Bartlett Deep, are narrow troughs, only a few miles in width, but hundreds of miles in length, three miles in depth, and bordered by steep precipices. . . . There are long ridges beneath the waters, which, if elevated, would stand up like islands of to-day. . . . Again, vast areas are underlain by shallow banks . . . often approaching the surface of the water, like that extending from Jamaica to Honduras. . . . The greater islands and the mainlands are bordered in places by submerged shelves." (From 'Cuba and Porto Rico': see authorities below.) All the islands are, then, to be regarded, from a physiographic point of view, as the "tops of a varied configura-

CARIBBEE — CARICATURE

tion which has its greatest relief beneath the sea"; and some of these submarine valleys and mountains have yielded a surprising number of animal forms previously unknown. Dredgings in depths of over 2,000 fathoms have brought to light new species of crustacea, and forms resembling the fossils of past geological epochs are taken alive in those profound marine valleys. Many phosphorescent creatures are found; in certain places "dense forests of pentacrinis undulate on the bottom like aquatic plants"; on the submerged banks and in the shallows, coral polyps and mollusks are employed as actively now as ever, in extracting the lime carried in solution by the sea-water, to build its shells and corals which are so large a part of the rock-making material in all this region, from Yucatan to Porto Rico. The most important marine highways for Caribbean commerce are those on the north: the Windward, Anegada, and Mona passages, and the Yucatan Channel. (For the origin of the name, see *CARIBS*) Consult: Agassiz, 'The Gulf Stream' (in annual report Smithsonian Inst to July 1891, Washington 1893); Hill, of United States Geological Survey, 'Cuba and Porto Rico' (1898).

MARRION WILCOX.

Authority on Latin-America.

Caribbee, *kä-rī-bē'*, or **St. Lucia Bark**, a bark sometimes substituted for cinchona (q.v.), though not containing its characteristic alkaloid. It is procured from the *Exostemma Caribæum*, a tree growing in the West Indies. This bark is in convex fragments, covered with a yellow epidermis, and has a very bitter taste and very faint smell.

Caribbee (*kär'ī bē*) **Islands**, a name commonly given to that portion of the chain of Lesser Antilles between the Virgin and South American groups. See *ANTILLES*.

Caribe, any of a group of small, robust, voracious fishes, often of singular form, and allied in structure to salmon, which abound in South American tropical rivers. They have numerous teeth, well fitted to biting out pieces of flesh, and instantly seize upon any disabled or soft-bodied creature in the water, and devour it or worry it. Hook-and-line fishing is almost useless where these little bandits are numerous, as they rob the hooks of bait, or tear to pieces anything caught before it can be lifted out of their reach. They will even attack and badly wound human bathers. One of the best known and most dreaded is the piraya of the Amazon, which is said to come in crowds wherever blood is shed in the water. These fishes constitute the subfamily *Scrrasalmoninae*, of the family *Characinidae*, and are intermediate between the cyprinoids and the salmonoids. A distinguishing characteristic is the fact that the abdomen is serrated with sharp spines.

Caribou, *kä-rī-boo'*, the name of two species of reindeer found in Canada. One of these, *Rangifer granlandicus*, known as the barren ground caribou, inhabits the barren country in the north of British North America, extending also into Greenland. In color it is reddish-brown above and white below in summer, but the winter coat is whiter and denser. It migrates northward in summer, but on the approach of winter it travels south to the forest country. The other species, the woodland caribou (*R. caribou*), is larger, but has smaller and less

branched horns. It inhabits the wooded country to the south of the places frequented by the above species. It is of a general dun-gray color, and the height at the shoulder is about three and a half feet. It is rather shy, and its fleetness enables it readily to distance those in pursuit. Its food consists mainly of lichens, but other vegetable products are also eaten.

Caribou, Maine, town in Aroostook County, 200 miles north of Bangor, on the Canadian P. R.R. It has two banks, a State fish hatchery, court-house, numerous churches and public schools. Its principal products are lumber, starch and potatoes. About 40 per cent of the population is French. Pop. (1900) 4,758.

Carica (from *Caria*, a district of Asia Minor, whence it was supposed to have come), a genus of plants, the typical one of the order of Papayads (*Papayaceae*). It contains about 10 species, all natives of tropical America. They are small trees without branches, and with large, variously lobed leaves, resembling those of some kinds of palm. They exude an acrid, milky juice when wounded. The most remarkable species is the *C. papaya*, the Papaw-tree, a small tree, seldom above 20 feet high, with a stem about a foot in diameter, tapering gradually to the top, where it is about four or five inches. The fruit is of a dingy orange-yellow color, oblong, about 10 inches long by three or four broad. The ripe fruit is made into sauce or preserved in sugar, and the juice of the unripe fruit is used to remove freckles. The leaves are employed as a substitute for soap. *C. digitata*, a tree which grows in Brazil, where it is called *chamburu*, is regarded almost with superstitious awe as a deadly poison. For the North American species, see *PAPAW*.

Caricature and **Caricaturists**. The two great modern cartoonists have been Sir John Tenniel and Thomas Nast, the former being to all Europe what the latter was to all America, and in connection with these two can be said all that need be said of caricaturists of our time. True, Nast was practically alone in his field, and he did not work as long as did Tenniel, still, to judge him at his best, though the period was comparatively short, he stood high as a picture-maker of that class. Nast was as brave as his subject, Tweed, was crooked, and the two furnished the best series of caricatures by far that have ever been seen in this, or, it might be said, in any other country. Nast, however, was not the draughtsman that Tenniel was, but what he lacked in artistic finish, he made up in power and force of expression.

Since the day of Tenniel and Nast, caricaturing seems to have fallen into less virile hands. Tenniel and Nast each drew a caricature once a week, while now caricaturists draw seven or eight in that time. Formerly the best caricaturists were employed on the weekly papers, while now the better class are employed on the great dailies. But the times have brought this about, not necessarily the caricaturists. Workingmen have no time to read, and a picture which may tell all at a glance means more to them than the ablest editorial that the combined editors of the country could write. A picture can be understood by all, whereas we have many languages and we speak but few, and read fewer. Words we forget, but pictures stay, filed away in our minds, and we refer to them

CARIES

on a moment's notice. Every day, as the pace quickens, and the press for time increases, we find our time for reading diminishes, thus the biograph excels the finest description ever written of the same thing.

We sometimes see so-called comic art, which is not comic, and called caricatures which are not true caricatures. A man who draws a picture of a man with a broad grin and winking with one eye, or cross-eyed, or perhaps a man standing with one foot on his other toe, is not necessarily a caricaturist any more than is the man who puts big feet and big noses on every person he draws. A young caricaturist who had submitted a picture to a critic for his judgment and had received a severe lecture on the bad drawing it displayed, made an attempt to hide behind the fact that it was a caricature, and therefore shouldn't be considered as the critic was considering it. Whereupon he replied: "No, never try to hide behind that. Remember one thing: that poor drawing is not caricature, and another, that all the bad artists in the country are not caricaturists. On the contrary, those who exaggerate the salient features must draw them even better, as more attention is called to a big nose or large ears if they are made conspicuously large, than would be the case otherwise."

But there is something else that a successful caricaturist must possess. That one thing, whatever it may be called, is of more importance than the art of drawing properly, and is a certain force of character, or of individuality which at once suggests strength of purpose and power. It can convey the feeling of sadness, of brute force, or excruciating mirth, yet many very fine draughtsmen who are styled caricaturists, never draw with that spirit predominant, and without it their productions are not true caricatures.

Thus, in trying to be caricaturists, such men are robbed of the chance of being serious illustrators, in which work they might succeed; and they never succeed as caricaturists.

There are three kinds of good caricatures: First, the strong, powerful, almost brutal; second, the humorous, the one instantly compelling laughter; and last, but not the least in effect, the pathetic; a picture capable of causing men to weep. The most effective are the powerful and the pathetic. The humorous is indeed attractive, if not overdone, but you soon forget its meaning. It can attack any and all things, from the weather to the President, without offense. But the most effective caricature is one that the subject of which would rather you would not print. Probably none can be made more powerful than the pathetic when it is timed and tempered just right, as its appeal to the sympathy is the surest way to the emotions. No caricaturist ever drew a caricature that would cause people to shed tears on seeing it, unless the artist shed tears when he drew it, any more than one could draw an angry political boss unless at the time of drawing one wore the same angry and hateful expression on one's own face. So with the humorist. One must wear a broad smile when he draws a man laughing, unless one is drawing him from life; and unless one is smiling when drawing smiling people, the subjects will seem to look and laugh only in mechanical fashion.

If the caricaturist is strong enough in his line to be called one, the first person he wins is himself. Once he has settled in his own mind that he is working for a just cause, it will be noticed at once that his work improves, and if he continues to study and put his heart and soul into it, others will be converted and he will acquire a following. If a cartoonist in his politics keeps side by side with his pictures he will be much more of a caricaturist than one who will work on a Democratic paper one day and the next on the Republican side. A young man in starting out should study and choose for himself and in that way he will find that he can lend more power and force to his work. It would be hard to imagine Thomas Nast being in private life a sympathizer with Tweed. The difficulty with caricaturists is that they are sometimes like the politician after the election, when he says: "No wonder the other side won; 'they bought us.'" What interest could one take outside of the mechanical reproduction if one knew that the caricaturist who had one year drawn powerful caricatures for one party would turn around the next year and work for the opposition. The power of a caricature becomes power only when the reader of the picture is convinced that that which is represented in the picture really did happen, and that cannot be done by a caricaturist if one day he is with the poor, and the next day with the rich; or in the same relation with any case that comes up.

The late John J. Ingalls said that the caricature did harm that good might follow. Caricatures, to be effective, should be founded on fragments of truth, though you are permitted to dig below the frost line. Without truth at the bottom they are powerless, and with truth at the bottom they are powerful and everlasting. Though Tweed, the man, is dead, Tweed, in the caricature, still lives, a prisoner in stripes, with ball and chain to his leg. A good caricature may be called an exaggeration of the truth. In these times there are great opportunities for the cartoonist. The billionaire will have to deal kindly and justly with his fellow-men, or else he will be more of a target than ever before, but the honest man need never fear a caricature; on the contrary, he can laugh and go about his business, and if he is attacked, the attacks will react in his favor. But they cannot be recommended as the steady diet for a dishonest person, since whether he has conscience or not, if they don't bring him to justice they will give him many a sleepless night.

HOMER DAVENPORT,
New York World.

Caries, kār'ī-ēz, a form of local death in bone, due to a variety of agents. Caries is usually distinguished from necrosis, another type of local death in bone, by the slower disintegration of the bone affected by the carious process. Necrosis usually results in the death of large pieces of bone, with the formation of sequestra.

CARIGARA — CARISSIMI

Caries is a gradual disintegration without sequestration. Caries is the result of inflammation of the softer tissues in the bone spaces, and is due usually to some definite form of irritant. It may be that of a gas, such as chlorine, or phosphorus, the latter causing in match-workers a form of caries of the jaw; but bacteria of tuberculosis and syphilis are the most frequent causes. Tuberculous caries is the most frequent form of the disease. See **HIP JOINT DISEASE**; **TUBERCULOSIS OF BONE**.

For caries of the teeth, see **TEETH**.

Carigara, *kā-rē-gā'ra*, Philippines, a town of the province of Leyte, situated on the north coast of the island, 22 miles west of Tacloban. It has a harbor formed by a bight extending 11 miles inland, carries on a considerable coast trade, and is an important hemp port. Pop. 14,000.

Carignano, *kā-rēn-yā'nō*, Italy, a city in the province of Turin, 11 miles south of the latter on the left bank of the Po. It is surrounded by old walls, and has a handsome square ornamented with arcades, some fine churches, some silk-spinning mills, and sugar-refineries. From this town is named a branch of the house of Savoy. Pop. 7,000.

Carillon, *kā-rē-yō'n*, a kind of chime, played either by hand or clockwork on a number of bells, forming a complete series or scale of tones or semi-tones, like those of the organ or harpsichord.

Carimata, *kā-rē-mā'ta*, or **Karimata**, a name applied to the strait between Borneo and Billiton; also to a cluster of a hundred islets and reefs (area, 57 square miles; pop. 500) in that strait; and lastly, to the principal member of the group, whose highest point reaches 2,600 feet.

Carina'ae, the name given by Merrem to one of the primary divisions of birds, variously ranked as an order (Huxley), a subclass (most modern ornithologists) an intermediate division (Gadow), or split up and distributed (Stejneger). The sternum is provided with a median keel or carina for the attachment of the chief muscles of flight. In a few flightless members, as the dodo, the keel has become abortive, and a few birds not generally recognized as belonging to the *Carinata* have keeled sterna, but are distinguished by other characters, such as the possession of a lizard-like tail, or a dromæognathous palate. The vast majority of living birds are carinate.

Carini, *kā-rē-nē*, Italy, a city in the island of Sicily, 11 miles northwest of Palermo. It is beautifully situated four miles from the sea, in a fertile region. It has a Gothic castle of the 14th century. Fishing is the chief occupation. The district produces much corn and wine. Pop. about 14,000.

Carin'thia (Ger. **KÄRNTHEN**), a duchy or province of Austria, between lat. 46° 24' and 47° 7' N., and lon. 12° 35' and 15° 10' E., bounded on the north by Salzburg and Styria, on the east by Styria, on the south by Carniola, and on the west by Italy and Tyrol; area, 3,986 square miles. It is extremely mountainous, generally sterile, and one of the most thinly populated provinces of Austria. The arable land does not exceed 200,000 acres, but there are some fertile valleys, and a considerable extent

of rich pasture land. It has several rivers and lakes. Of the former the principal is the Drave. All of them abound with fish. The country does not yield corn enough for the consumption of the inhabitants, who import the deficiency from Hungary. The cereals most extensively cultivated are rye and oats. Some wine is produced in Lower Carinthia, but it is of inferior quality. Cattle, sheep, and horses are raised in considerable numbers, but the mines of Carinthia are the main sources of its wealth. The chief of these are lead, iron, and calamine. Various kinds of gems are met with. Its operative industry is chiefly confined to the working of its metallic ores, though there are also manufactories of woollens, cottons, silk stuffs, etc., most of which are in Klagenfurt, the capital. The principal towns are Klagenfurt and Villach. Carinthia formed part of the empire of Charlemagne, and afterward belonged to the dukes of Friuli. It subsequently passed through various hands, and finally became an appendage of the Austrian crown in 1321. In 1809 it was annexed to the empire of Napoleon, but was restored to Austria in 1814. Nearly all the inhabitants are Roman Catholics. Pop. (1900) 367,344.

Cari'nus, Marcus Aurelius, Roman emperor: d. 285 A.D. He was the elder of the two sons of the Roman emperor Carus, who conjointly succeeded to the throne on the death of their father, 284 A.D. His brother was supposed to have been murdered on his return from the East, and Carinus, ruling alone, became one of the most profligate and cruel of the Roman emperors. The soldiers having rebelled, and proclaimed Diocletian, Carinus collected the troops that were in Italy and marched into Mœsia to meet Diocletian, and quell the revolt. A decisive battle was fought near Margus, in which Carinus gained the victory, but in the moment of triumph he was slain by one of his own officers, whom the vices of the emperor had outraged.

Caripe, *ka-rē'pā*, Venezuela, a town situated in a valley on the northern part of the province of Bermudez. It was formerly the headquarters of the Capuchins, and contains the ruins of their church cloister. In the vicinity are the large caves, described by Humboldt, in which lives the bird known as guacharo, a kind of nighthawk. Pop. about 4,000.

Carisbrooke, *kār'is-brūk*, England, a village in Hampshire, pleasantly situated at the foot of a hill, near the centre of the Isle of Wight, and overlooked by the ruins of its ancient castle, where Charles I. was imprisoned 13 months, previous to his trial and execution. The castle and grounds cover 20 acres. The parish church of St. Mary is a venerable structure, with a fine tower containing a chime of bells. It was formerly attached to a Benedictine priory founded under William the Conqueror, but the priory no longer exists. In 1859 a Roman villa was discovered at Carisbrooke, and the place seems to have been a fortress at the time of the Roman occupation. Pop. about 9,000.

Carissimi, *jā'kō-mō kā-rēs'sē-mē*, Italian composer: b. Marino, 1604; d. Rome, 12 Jan. 1674. He became musical director of the church of St. Apollinaris in Rome in 1628, and continued in that position until his death. He wrote many oratorios, cantatas, and

CARITA — CARLETON

motets, and has been praised for his characteristic expression of feeling, and his easy, flowing style. He deserves most honor for the improvement of the recitative, having given it a more expressive and natural language, and he greatly developed the sacred cantata. His oratorio 'Jonah' has been revived in recent times. It anticipates in the descriptive passages some of the effects since elaborated by the modern classical composers, and it is altogether distinguished by freedom, boldness, and striking antiphonal imitations.

Carita, *kä-rē-ta'* (Italian from the Latin *caritas*, love), a name, in the fine arts, applied to the representation of Christian love. It is exhibited under the figure of a tender mother, in the midst of her children, manifesting her kindness and affection for them.

Carl, William C., American organist: b. Bloomfield, N. J., 2 March 1865. He is a member of the American Guild of Organists, a director of the Guilman Organ School, New York, and organist of the First Presbyterian Church there. He has published 'Several Songs and Organ Arrangements' (1892); 'Masterpieces for the Organ' (1898); 'Thirty Postludes for the Organ' (1900).

Carlen, kär-län', Emilia Smith Flygare, Swedish novelist: b. Stromstad, 8 Aug. 1807; d. Stockholm, 5 Feb. 1892. In 1838 she published her first novel, 'Waldemar Klein,' and among the best of her subsequent works are the 'Professor' (1840); 'A Year' (1846); 'The Brother's Bet'; and 'The Guardian' (1851). Several of her novels have been translated into English. In 1827 she married a physician named Flygare, and in 1841, after the death of her first husband, she married J. G. Carlen (q.v.), a lawyer and poet. In 1878 she published a volume of 'Reminiscences of Swedish Literary Life.' She had clear insight into the conditions of human life, especially of life in the middle class, and she describes it with admirable fidelity.

Carlén, Johan Gabriel, *yō'hàn gä'brē* *ül*, Swedish poet and romancer: b. Westgotland, Sweden, 9 July 1814; d. Stockholm, 6 July 1875. He was the second husband of Emilia Carlen (q.v.), and was the author of 'Romanser Svenska Volkliet' ('Romances of Swedish Life') (1840); etc.

Carlén, Rosa, Swedish novelist: b. 1836; d. 1883. Her first story, 'Agnes Tell' (1861), had a very favorable reception. Then followed 'Tuva' (1862); 'Helena, a Woman's History' (1863); 'Three Years and Three Days' (1864); 'The Gypsy's Son' (1866), which is regarded as her most perfect work.

Carles, kär'lās, Philippines, a town of the province of Iloilo, situated on the northeastern point of the island of Panay, in what was formerly the district of Concepcion. Pop. about 10,000.

Carleton, kär'l'ton, Sir Guy, Lord DORCHESTER, British general: b. Ireland, 3 Sept. 1724; d. Maidenhead, England, 10 Nov. 1808. He distinguished himself at the sieges of Louisbourg, Quebec, and Belle Isle, and was wounded in 1762 at the siege of Havana. In 1772 he was made governor of Quebec. On the nomination of Burgoyne to the command, he threw up

his commission, but was appointed the same year lieutenant-general, and succeeded Sir Henry Clinton as commander-in-chief in the American colonies.

Carleton, Henry Guy, American journalist and dramatist: b. Fort Union, New Mexico, 21 June 1855. He pursued journalism in New Orleans and New York, and has written several plays, including 'Memnon, a Tragedy'; 'Victor Durand' (presented 1884); and 'The Pember-ton's' (presented 1890).

Carleton, James Henry, American soldier: b. Maine, 1814; d. San Antonio, Texas, 7 Jan. 1873. In February 1839 he took part in the "Aroostook war," relative to the northeast boundary of the United States, and later was commissioned second lieutenant in the 1st United States Dragoons. In 1846 he took part in Kearny's expedition to the Rocky Mountains, served on Gen. Wool's staff in the Mexican war, receiving the brevet rank of major for gallantry at Buena Vista; and later was chiefly employed in exploring expeditions and against hostile Indians. In 1861 he was ordered to southern California, raised the famous "California column," and marched across the Yuma and Gila deserts to Mesilla on the Rio Grande. As commander of the Department of New Mexico he was active in a number of severe engagements. For his services he was brevetted major-general, 13 March 1865; became lieutenant-colonel of the 4th Cavalry, 31 July 1866; and was promoted colonel of the 2d Cavalry, June 1868, and ordered with his regiment to Texas. He wrote 'The Battle of Buena Vista' (1848).

Carleton, Will, American poet: b. Hudson, Mich., 21 Oct. 1845. He is best known in literature by his ballads of home life, many of them having gained great popularity. His books include 'Poems' (1871); 'Farm Legends' (1875); 'City Ballads' (1888); 'City Legends' (1889); 'City Festivals'; 'Rhymes of Our Planet'; 'The Old Infant, and Similar Stories'; 'Young Folks' Centennial Rhymes.'

Carleton, William, Irish novelist: b. Prillisk, County of Tyrone, 1794; d. Dublin, 30 Jan. 1869. Son of a peasant, he had to endure all the miseries of a poor Irishman's lot. His education commenced at a hedge-school, and terminated with two years' training in an academy at Glasslough. Thence he went to Dublin, with about three shillings in his pocket, and after a little began to support himself by private teaching. He also began writing for the 'Christian Examiner,' and in 1830 published his 'Traits and Stories of the Irish Peasantry.' Popular tastes and critical judgment were both satisfied by the novelty of contents and freshness of style. A second series followed in 1833, and was as universally welcomed. Among later works of his are 'Fardorougha, the Miser' (1839); 'The Misfortunes of Barney Brangan' (1841); 'Valentine M'Clutchy' (1845); 'The Black Prophet' (1847); 'The Tithe Proctor' (1849); 'Willy Reilly' (1855); and 'The Evil Eye' (1860). Ireland has found in Carleton a faithful and fearless exponent of her thoughts and feelings; but outsiders cannot help thinking him somewhat too much of a partisan. He enjoyed a government allowance of £200 per annum several years before his death.

CARLETON COLLEGE — CARLISLE

Carleton College, a co-educational institution in Northfield, Minn.; organized in 1866 under the auspices of the Congregational Church. In 1903 it had 14 instructors, 218 students, 17,000 volumes in its library and its property, including endowment, was estimated at \$683,777.

Carli, Giovanni Rinaldo, jō-vān'nē rē-nāl'-dō kār lē, COUNT, Italian writer: b. Capo d'Istria, 11 April 1720; d. 22 Feb. 1795. He was of an ancient, noble family, and early manifested an inclination for the study of the Middle Ages, with which he connected the study of belles-lettres and of poetry. In his 24th year the senate of Venice made him professor of astronomy and naval science. The care which his large estates required compelled Carli to resign his professorship and retire to Istria, where he spent his time in the study of antiquities, on which he wrote some valuable treatises. He was afterward appointed by the emperor president of the highest commercial court at Milan, and subsequently president of the College of Finance in the same city. He published his works (1784-94) in 15 volumes, under the title 'Opere del Sig. Commendatore D. Gian Rinaldo, Conte Carli, Presidente,' etc., but this edition does not include his 'Delle Monete' (1754-60); and 'Delle Antichità Italiane' (1788-91).

Carlin, Thomas, American politician: b. Kentucky, 1790; d. 2 Feb. 1852. He removed to Illinois in 1813, and gradually accumulated wealth, and became known and respected among the scattered population about him. He was elected governor in 1838, and retained that office for four years, during a period of unusual and violent political excitement. Illinois, having engaged largely in internal improvements, suffered severely from the commercial revolution which was then paralyzing the whole country. She was much in debt, and had within her borders no specie, and no available means of payment. The discussion of the slavery question, too, was then furious, and had just led to the tragic death of E. P. Lovejoy. At the same time the Mormons took up their position at Nauvoo, and politicians were beginning those movements for partisan ends which seemed likely to throw the State into anarchy, and which ended ere long in the violent death of the Mormon leader. That Gov. Carlin, amid such a condition of affairs, was three times re-elected to the chief magistracy, affords a sure indication both of his popularity and his force of character.

Carline Thistle. See THISTLE.

Carlinville, Ill., a city and county-seat of Macoupin County, 60 miles southwest of Springfield; on the Chicago & Alton, and other railroads. It has a prosperous local trade and manufactures of bricks and tiles, agricultural implements, etc. There are coal-mines in the vicinity. It is the seat of Blackburn University, a Presbyterian institution. Its court-house is considered one of the finest public buildings in the State. Pop. (1900) 3,502.

Carlisle, kār lil', George William Frederic Howard, 7th earl, b. 18 April 1802; d. 4 Dec. 1864. He became earl 7 Oct. 1848, previous to which, as Lord Morpeth, he had traveled extensively in the United States. He was a long

time attaché to the British embassy at St. Petersburg. In the reformed House of Commons he represented the West Riding of Yorkshire, and under the Melbourne ministry was secretary of state for Ireland. In 1841 he was defeated in the West Riding by his Conservative opponents. In 1846, under the administration of Lord John Russell, he was appointed commissioner of woods and forests, and chancellor of the duchy of Lancaster. He was the first of the Whig noblemen of the official class to give in his adhesion to the views of the Anti-Corn Law League. In 1856 he delivered before the Mechanics' Institute at Leeds two lectures, since published, on the life and writings of Pope, and on the United States. Previous to the Crimean war, he made a tour in the east of Europe, and published his 'Diary in Turkish and Greek Waters.' On the accession of Lord Palmerston in 1855, he was nominated lord lieutenant of Ireland, which office he held till the resignation of the Palmerston ministry in 1858. A work by him entitled 'The Second Vision of Daniel' was published in 1858.

Carlisle, John Griffin, American statesman: b. Kenton County, Ky., 5 Sept. 1835. He received a common-school education, studied law, and was admitted to the bar in 1858. He served several terms in the lower house of the State legislature. During the Civil War he actively opposed secession, and in 1866 and 1869 was a member of the State senate. He was lieutenant-governor of Kentucky, 1871-5; was elected to Congress, 1876, and five times re-elected. His ability soon made him one of the Democratic leaders. In the 48th, 49th, and 50th congresses he was chosen speaker. In 1890 he was elected United States senator, but resigned in March 1893, to accept the portfolio of secretary of the treasury in President Cleveland's Cabinet. At the close of his term he settled in New York to practise law.

Carlisle, England, city and capital of Cumberlandshire; at the confluence of the Caldew and Eden rivers. It has steamboat and railroad communications with Liverpool, Belfast, etc. Gingham, cotton checks, etc., are its chief manufactures. Its most noted building is a cathedral founded by William Rufus. It lost its nave, with the exception of the two eastern bays, during the civil war, but the choir, 138 feet long, is very beautiful and contains an east window, by many judges esteemed the finest in England. There is also a castle, founded in 1092. Carlisle was the ancient capital of the kings of Cumbria, and was sacked by the Danes in 900. During the English and Scotch border wars it was frequently besieged. It was here that Buccleuch rescued Kinmont Willie. During the civil war the town twice surrendered to the Parliamentarians (1645 and 1648). Pop. (1901) 45,000. See Creighton, 'Carlisle' in 'Historic Towns' series (1889).

Carlisle, Pa., borough and county-seat of Cumberland County, on the Cumberland V., and the Gettysburg & H. R.R.'s; 18 miles west of Harrisburg. It is the farming and manufacturing trade centre of Cumberland County, and is the site of Dickinson College, founded 1783, Metzger Female College, and the United States Indian Training School. It has a national bank, large manufacturing establishments, Hamilton Library, Todd Hospital, and an assessed

CARLISLE INDIAN SCHOOL — CARLOS

property valuation of \$3,000,000. It was the headquarters of Washington during the Whisky Rebellion in 1794, and was bombarded by the Confederates in 1863. Pop. (1900) 9,626.

Carlisle Indian School. See UNITED STATES INDIAN TRAINING AND INDUSTRIAL SCHOOL.

Carl'ists, a Spanish political faction which advocates the claims of Carlos of Bourbon and his descendants to the Spanish throne. In 1833 the Carlists, whose chief strength lay in the Basque provinces, and who, because of their Catholic traditions and tendencies, were secretly favored by the Pope and the eastern powers, raised the standard of revolt. They had the advantage until 1836, when Espartero inflicted on them a terrific defeat at Luchana. In August 1839 their commander, Maroto, treacherously made peace, and the remaining Carlists soon fled to France. In 1873 the grandson of the first pretender raised another revolt in the Basque provinces of Navarre and Biscay, but after several sharp conflicts the rebels were hemmed in along the north coast, and in 1876 the pretender and his chief supporters fled into France.

Carll, John Franklin, American geologist: b. Long Island, N. Y., 7 May 1828. He became identified with coal oil development early in life, and has perfected many oil-pumping devices. Since 1874 he has been connected with the Pennsylvania Geological Survey.

Carlone, kār-lō'nā, the name of an Italian family of distinguished artists, who flourished chiefly in the 17th and 18th centuries. The most celebrated of them are: 1. TADDEO, a native of Lombardy, who excelled in sculpture, and was employed, along with his brother Joseph, by the courts of England, Spain, and Mantua; d. 1613. 2. GIOVANNI, eldest son of Taddeo: b. Genoa, 1590; d. 1630. He made great progress in painting under the tuition of his father and Peter Sorri, and, having afterward studied under Passignano, distinguished himself particularly by his frescoes, in which the freedom and spirit of his design, the depth of his expression, grandeur of his conception, and the richness of his coloring are particularly admired. 3. GIOVANNI BATTISTA, brother of the former: b. Genoa, 1598; d. 1659 or 1680. He was also a scholar of Passignano, and painted with his brother, whose style he followed so exactly that it is difficult to distinguish their pictures. He ultimately entered the service of the Duke of Savoy. He excelled particularly in frescoes, which are so soft, fresh, and uniform that they resemble oil paintings. 4. ANDREA, son of Giovanni Battista: b. 1627; d. 1697. He rose to great eminence as a painter. He took chiefly for his models Titian, Veronese, and Tintoretto, and founded a school of painting in Perugia.

Carlos de Bourbon, DON MARIA ISIDOR, mā-rē'a ēs'ē-dōr, second son of Charles IV. of Spain and brother of Ferdinand VII.: b. 29 March 1788; d. Trieste, 10 March 1855. In 1808 he was compelled by Napoleon along with his brother, who had now succeeded to the throne, to renounce all claims to the succession, and was detained with Ferdinand in captivity at Valençay in France till 1814. In 1816 he married Maria Francisca d'Assis, daughter of John VI. of Portugal, his brother the king of Spain having at the same time espoused another daughter of

John as his second wife. This last marriage, like Ferdinand's first, having turned out unproductive of issue, a prospect opened to Don Carlos of succeeding to the crown, which almost assumed the shape of absolute certainty when a third marriage contracted by Ferdinand proved equally unsuccessful with the two former in producing an heir to the Spanish monarchy. On the death of Ferdinand's third wife in 1829 he again married, and, by a pragmatic sanction, the contingency of a female heir was provided for by the repeal of the Salic law, which excluded such from the throne. On 10 Oct. 1830, Maria Isabella, afterward queen of Spain, was born. In 1832 Don Carlos' party succeeded by taking advantage of the king's imbecile condition to obtain a repeal of the pragmatic sanction; but this advantage was only temporary, as Ferdinand disowned his act on recovering the use of his reason. The following year Don Carlos was exiled with his wife to Portugal; and having refused to return from thence to be present at the taking of the oath of allegiance to the young queen, he was commanded by Ferdinand to retire to the Papal States. On 29 Sept. 1833 Ferdinand VII. died, and a few days afterward his consort the queen-regent repeated the order to his brother to quit the country. The latter, however, now announced himself as legitimate king of Spain, and was recognized as such by a considerable party who excited a civil war in his favor, and thenceforward were designated by the title of Carlists. After a course of hostilities extending over several years with varying success, he found himself obliged in 1839 to take shelter in France. In the meantime he and his descendants had been formally excluded from the succession by a vote of the Cortes in 1836. On arriving in France the castle of Bourges was assigned him as a residence, and he was also detained a prisoner there for a considerable time owing to his refusal to make the renunciations demanded of him. In 1845 he resigned his claims in favor of his eldest son, and in 1847 was permitted to take up his abode in Trieste, where he died.

Carlos, Don, dōn kār'lōs, Infant of Spain, son of Philip II. and Maria of Portugal: b. Valladolid, 8 July 1545; d. 1568. He was sickly, and one of his legs was shorter than the other. The extreme indulgence with which he was educated by Joan, sister of the king, confirmed his violent, obstinate, and vindictive disposition. In 1560 Philip caused him to be acknowledged heir of the throne by the estates assembled at Toledo, and in 1562 he sent him to the University of Alcalá de Henares in hopes that the study of the sciences would soften his turbulent character. Contemporary historians differ in the description of the prince. According to some he had a thirst for glory, an elevated courage, pride, and a love of power. According to others he was fond of whatever was strange and uncommon; an accident or opposition irritated him to frenzy; address and submission softened him. He is also represented as a favorer of the insurgents in the Netherlands, and in particular as an enemy of the Inquisition; yet he possessed neither knowledge nor principles, nor even sufficient understanding to be capable of liberal views. With him all was passionate excitement, which resistance converted into fury. Llorente has corrected the

CARLOS — CARLOTTA

accounts of the character and fate of this prince from authentic sources in his work on the Spanish Inquisition (q.v.). According to him Don Carlos was arrogant, brutal, ignorant, and ill-educated. This much is certain, that at the Congress of Cateau Cambrésis (1559) the marriage of Don Carlos with Elizabeth, daughter of Henry II. of France, was proposed; but Philip, being left a widower by the death of Mary of England, took the place of his son. Don Carlos is said to have loved Elizabeth, and to have never forgiven his father for having deprived him of her. Llorente proves, however, that Don Carlos never had fallen in love with the queen, and that she was never too intimate with him. In 1563 Philip, who had no other heir than Don Carlos, considering him unfit for the throne, sent for his nephews, the archdukes Rodolph and Ernestus, to secure to them the succession to his dominions. Don Carlos, who lived in continual misunderstanding with his father, resolved in 1565 to leave Spain, and was on the point of embarking when Ruy Gomez de Silva, a confidant both of Philip and Carlos, dissuaded him from his resolution. In 1567, when the rebellion in the Low Countries disquieted Philip, Don Carlos wrote to several grandees of the kingdom that he had the intention of going to Germany. He disclosed his plan to his uncle, Don John of Austria, who told Philip what Don Carlos had confided to him. It is believed that he was touched by the sufferings of the people of the Netherlands. Philip himself seemed to believe that his son intended to go to the Netherlands. The infant had often shown a vehement desire to participate in the government. But Philip, jealous of his own authority, treated his son coolly and with reserve, while he gave his confidence to the Duke of Alva, to Ruy Gomez de Silva, Don Juan of Austria, and Spinola. Don Carlos conceived an invincible aversion to them. The architect of the Escorial, Louis de Foix, narrates the following story relating to Don Carlos, which has been preserved to us by De Thou. The prince had always under his pillow two naked swords, two loaded pistols, and at the side of his bed several guns, and a chest full of other firearms. He was often heard to complain that his father had deprived him of his bride. On Christmas evening he confessed to a priest that he had resolved to murder a man. The priest, therefore, refused him absolution. The prior of the monastery of Atocha artfully drew from him expressions from which it could be inferred that he meditated an attempt upon his own father. The story was then communicated to the king, who exclaimed, "I am the man whom my son intends to murder; but I shall take measures to prevent it." Thus Philip, impelled by hatred or fear, by policy or superstition, resolved on the destruction of his only son, in whom he saw only a criminal, unworthy of the crown. On the night of 18 Jan. 1568 while Don Carlos was buried in a deep sleep, Count Lerma entered his chamber and removed his arms. Then appeared the king, preceded by Ruy Gomez de Silva, the Duke of Feria, the grand prior of the order of St. John, brother of the Duke of Alva, and several officers of the guard, and state councilors. Don Carlos still slept. They awoke him: he beheld the king his father, and exclaimed, "I am a dead man." Then, addressing Philip, he said,

"Does your majesty wish to kill me? I am not mad, but reduced to despair by my sufferings." He conjured with tears those who were present to put him to death. "I am not come," answered the king, "to put you to death, but to punish you as a father, and to bring you back to your duty." He then commanded him to rise, deprived him of his domestics, ordered a box of papers under his bed to be seized, and committed him to the care of the Duke of Feria and six noblemen, enjoining them not to permit him to write nor to speak with any one. These guards clothed Don Carlos in a mourning dress, took from his chamber the tapestry, the furniture, and even his bed. Don Carlos, full of rage and despair, caused a large fire to be kindled, under pretext of the extreme cold of the winter, and threw himself suddenly into the flames. It was with difficulty that he was rescued. He attempted by turns to finish his life by thirst, by hunger, by eating to excess. After Philip had endeavored to justify his measures to the Pope and the principal sovereigns of Europe, and had also given notice to the superior clergy, the courts of justice, and the cities of his empire, of what had passed, he referred the case of the prince, not to the Inquisition, but to the council of state, under the direction of Cardinal Espinosa, who was state councilor, grand inquisitor, and president of the junta of Castile. This court is said, after a minute examination and hearing many witnesses, to have condemned him to death. Other accounts, however, state that he died of a malignant fever before any judgment was passed, after having taken the sacrament with much devotion, and having asked his father's pardon, 24 July 1568. The melancholy fate of Don Carlos has served as a subject for several tragedies—those of Schiller, Alfieri, Otway, and Campistron.

Carlos, Don, COUNT DE MONTEMOLIN, son of Carlos de Bourbon (q.v.): b. 31 Jan. 1818: d. Trieste, 1861. He was long resident in London, and in 1850 married Maria Carolina Ferdinanda, a sister of Ferdinand II., king of Naples. On more than one occasion he endeavored to excite an insurrection in his favor in his native country, but these attempts were always frustrated. In 1860, when he made his last venture, he and his army were taken prisoners by the troops of Isabella. The rebel general was shot, and Don Carlos liberated only on condition of solemnly renouncing all claims to the crown—an act which he repudiated when he got out of the hands of his enemies.

Carlota, kâr-lô'ta, Philippines, (1) a town of Negros Occidental, situated in the western part of the island of Negros, 20 miles south of Bacolod. Pop. 12,004. (2) A town in the eastern part of the island of Negros (Negros Oriental), where the insular government owns a plantation of 2,000 acres. Pop. 6,386.

Carlot'ta (MARIE CARLOTTA AMELIE), empress of Mexico: b. near Brussels, 7 June 1840. She was the daughter of Leopold I., king of Belgium, and married Maximilian, Archduke of Austria, 27 June 1857. In 1864 she went with her husband to Mexico and remained there till 1866, when the dissatisfaction against the empire forced her husband to send her to ask help from France. She could obtain no assistance from Napoleon III. and went to Rome

CARLOVINGIANS — CARLSHAMN

to appeal to the Pope. Before negotiations there were completed, her health gave way under the strain, and after the end of the empire and the execution of her husband she became totally insane. She was taken to the Château de Bouchoute, near Brussels, Belgium, where she lives, an incurable invalid.

Carlovin'gians, the second dynasty of the French or Frankish kings, which supplanted the Merovingians, deriving the name from Charles Martel or his grandson Charlemagne (that is, Karl or Charles the Great). Its origin is usually traced to Arnulph, a bishop of Metz, who died in 631. Charles Martel became mayor of the palace in 714 to the Merovingian *roi fainéant* Childeric, and in this office was succeeded by his son Pepin le Bref, who in 752 deposed the merely nominal king and himself assumed that title. He was succeeded by Charlemagne and his brother Carloman (768-771). Charlemagne became sole king in 771, and extended greatly the dominions of the family. In 800 Leo III. crowned him emperor of the west. On his death in 814 he was succeeded by his son Louis le Débonnaire. He divided his empire among his sons, and at his death, in 840, his son Charles the Bald became king of France. He died in 877, and was succeeded by a number of feeble princes. The dynasty came to an end with Louis V., who died in 987. The house of Capet followed it.

Carlovitz, or Carlowitz. See KARLOWITZ.

Carlow, kar-low, Ireland, an inland county in the province of Leinster, surrounded by Kildare, Wicklow, Wexford, Kilkenny, and Queen's County. It is generally level or undulating except in the southeastern parts. The chief rivers are the Slaney and Barrow. From the remarkable fertility of its soil it is altogether an agricultural county, producing a great deal of butter, corn, flour, and other agricultural produce for exportation. Agriculture is here carried on with as much skill and knowledge of recent improvements as anywhere in Ireland, and there is less poverty than in most parts. Area 353 square miles. Pop. (1901) 37,723.

Carlow, Ireland, a town of the county of Carlow, on the Barrow, 34 miles southwest of Dublin, with which it is connected by railway and canal. It has two principal streets intersecting at right angles. A bridge of five arches leads over the Barrow to the suburban village of Graigue, in Queen's County. The principal public buildings are the Roman Catholic cathedral and college, three convents, barracks, a lunatic asylum, a court-house, town-hall, union work-house, an infirmary, and a fever hospital. It is lighted by electricity, and has an excellent water-supply. Carlow is the principal mart for the agricultural produce of the surrounding country, and carries on an extensive trade in corn, malt, butter, etc. On rising ground to the south stand the ruins of the ancient castle of Carlow, still presenting a very imposing appearance. Pop. (1901) 7,200.

Carlsbad, kār's'bāt, Bohemia, a town on the Tepl, near its influx to the Eger, 116 miles west by north of Prague. It is widely celebrated for its hot mineral springs, and is frequented in summer by visitors of the most aristocratic character from all parts of Europe. In the season, April to October, the visitors number

from 25,000 to 30,000. Set in most lovely scenery, the town is well built, and offers good accommodation for its guests. The temperature of the hot springs varies from 117° to 167° F. The principal spring, the Sprudel, has a very large volume, and is forced up to a height of three feet from the ground. Altogether, the daily flow of the springs of Carlsbad is estimated at 2,000,000 gallons. The principal ingredient in the water is sulphate of soda. The whole town of Carlsbad appears to stand on a vast caldron of boiling water, which is kept from bursting only by the safety-valves the springs provide. Ascribing its foundation to the Emperor Charles IV. (1347), Carlsbad was made a free town by Joseph I. Pop. (1903) about 15,000.

Carlsbad, Congress of, a conference of ministers representing Austria, Prussia, and many small German states, which met at Carlsbad in August 1819 to discuss the democratic tendencies then manifesting themselves in Germany. Its members recommended to their governments and to the German Diet, the famous 'Carlsbad Decrees,' which were adopted by the Diet, 20 Sept. 1819. Among the most important of the decrees were those recommending severe press censorship, the establishment at Mainz of a central commission for the investigation of political intrigues, the suppression of the secret student organization, the Burschenschaft, and government inspection of the universities.

Carlsburg, kār's'boorg, or **Karlsburg**, Austro-Hungary, a town (ancient Apulum) on the right bank of the Maros, 33 miles northwest of Hermannstadt. It consists of an upper and a lower town, situated on opposite sides of the river, and communicating by a long bridge. It is defended by a citadel, and has a cathedral with a number of ancient monuments, a mint where the gold and silver obtained in Transylvania are purified and coined, an observatory with a good collection of instruments, an excellent library, a theological college, a gymnasium, normal school, arsenal, and barracks. Pop. 8,000.

Carlsrona, kār's'krō-na, or **Karlskrona** ('Charles' Crown'), Sweden, a seaport at the southern extremity of the peninsula, on the Baltic, capital of the län or province of Blekinge or Carlsrona. It stands on several rocky islets connected with one another and with the mainland by bridges, has broad, clean, but somewhat steep streets, with houses mostly built of wood. The harbor is safe and spacious, the entrance protected by forts. It was founded by Charles XII. in 1680. As the chief Swedish naval station the town largely depends on the trade thereby occasioned, but it has also a considerable export trade in timber, tar, potash, tallow, etc. Pop. (1900) 23,955.

Carlsen, Emil, American artist: b. Denmark, 1848. He came to the United States in 1872 and studied art in Boston. Since 1891 he has lived in New York and has exhibited frequently there. His especial field is still life painting, but he is also favorably known as a landscape artist.

Carlshamn, kār's'hām ('Charles' Haven'), Sweden, a seaport town, 27 miles west of Carlsrona, in a beautiful valley at the mouth of the Mie-A. It is regularly built, and its

CARLSON — CARLYLE

square market-place, planted on all sides with trees, has a fine appearance. It has an elegant town-house, a good harbor, and an active trade. Timber and articles of timber constitute the chief exports. The manufactures are sail-cloth, sacking, tobacco, leather, etc.; and there is also some ship-building. Pop. (1890) 7,191.

Carlson, kår'l'sõn, Fredrik Ferdinand, Swedish historian: b. Upland, 13 June 1811; d. Stockholm, 18 March 1887. He was prominent in public matters for many years, being minister of ecclesiastical affairs, 1863-70, and again, 1875-8. He wrote, among other works, a 'History of Sweden' (1855-87), which ranks high because of its exhaustive accuracy and literary merit.

Carlsruhe, kår'l's'roo-ü, or Karlsruhe ("Charles' Rest"), Germany, the capital of the grand-duchy of Baden. It was laid out in 1715, and is one of the most regularly built towns in Europe. The castle of the grand-duke stands in the centre of the city, and from this point a number of streets radiate fan fashion, at regular distances from each other. Other streets intersect these in parallel circles. The roads leading to the city correspond to this regular disposition, which, as is apt to be the case in strictly regular cities, often leaves upon the traveler the impression of monotony rather than that of agreeable order. The city is ornamented with several beautiful public buildings, including the palace, in front of which is a bronze statue of the founder of the city, the margrave, Charles William, the parliament house, town hall, etc. The court library contains 150,000 volumes; there are also here several valuable museums and cabinets, a botanic garden, several institutions for the promotion of literature and the fine arts, and sundry industrial establishments, such as a foundry and electro-plating work, an engine factory, carriage works, etc. Pop. (1900) 97,164.

Carlstad, kår'l städ, Sweden, a town and the capital of the lan of the same name, on an island in Lake Wener formed by the two mouths of the Klar, and connected with the mainland by a bridge across either stream. It is beautifully situated, regularly built, is the seat of a bishop, and has a cathedral, gymnasium, town-house, etc., and some trade in copper, timber, iron, and grain. Pop. (1900) 11,869.

Carlstadt, Andreas Rudolf, än'drâ äs roo dölf kår'l'stat, Bodenstein, German theologian: b. Carlstadt, Franconia, 1480; d. Basel, Switzerland, 25 Dec. 1541. He is celebrated in the history of the Reformation for his fanaticism as well as his misfortunes. He was appointed professor of theology at Wittenberg in 1513. His learning enabled him to render great support to Luther in his first steps for the introduction of a reformation. In 1520 he was included in the bull which condemned Luther; and his spirited appeal from the Pope to a general council, of which he gave the first example, as well as his opinion, openly expressed, in favor of the marriage of the priesthood, which soon gained ground, was among the many proofs which he gave of his zeal for the Reformation. While Luther was at Wartburg Carlstadt's zeal urged him to acts of violence. He even instigated the people and students to the destruction of the altars and the images of the saints, greatly to the displeasure of Luther, who lost

the friendship of Carlstadt by his opposition to his excesses. In 1524 he publicly declared himself the opponent of Luther, and the Elector Frederick banished him from the country in September 1524. Carlstadt upon this commenced the controversy respecting the sacrament, denying, in opposition to Luther, the bodily presence of Christ in the sacramental elements, and recognizing in the rite a token of remembrance simply. This controversy was carried on with the bitterest animosity; and Zwinglius having declared himself in favor of Carlstadt's doctrine, a dispute ensued between the Swiss and Wittenberg theologians, which ended in the separation of the Calvinists and Lutherans. Carlstadt in the meantime, being suspected, not without reason, of having taken part in the revolt of the peasants in Franconia, was obliged to wander through Germany, and being ultimately reduced to extreme distress, sought relief of Luther, who procured him an asylum at Kemberg, on condition that he should refrain from the expression of his opinions. Here he lived nearly three years. His restless mind, however, soon led him to break his promise, by the publication of some writings in 1528; and he even went so far as to plot against Luther's person. To escape from the consequences of his conduct he repaired to Switzerland at the end of the same year, where he was appointed vicar of Altstadt, in the valley of the Rhine; in 1530, deacon at Zurich; and in 1534, vicar and professor of theology at Basel.

Carlstadt, Austria, a town in Croatia, 34 miles southwest of Agram, agreeably situated in a perfectly level and richly cultivated plain near the junction of the Kulpa, Korana, and Dobra, which are here navigable. It consists of the town proper and the citadel, together with the suburb of Dubovacz. It is the seat of a Greek bishopric, is tolerably well built, and has an important trade. Pop. (1890) 5,559.

Carlton, Charles, Anglo-American educator: b. Eythorne, Kent, England, 21 Aug. 1821; d. Bonham, Texas, 13 Feb. 1902. He removed to Toronto, Ontario, spent several years as a seaman and subsequently while working on a farm at Fredonia, N. Y., studied for the ministry, and was graduated from Bethany College, W. Va., in 1849. He was successively pastor in Georgetown, Ky.; Lexington, Mo.; Little Rock and Van Buren, Ark. and in 1867 removed to Bonham which continued his home for the rest of his life. There he established a co-educational school called Bonham Seminary, which in 1882 changed its name to Carlton College and became an institution for women solely. He was a prominent leader in the Christian denomination in Texas.

Carlyle, kår'-lil', Alexander, Scottish clergyman: b. Prestonpans, 26 Jan. 1722; d. Inveresk, 25 Aug. 1805. He was educated at the universities of Edinburgh and Glasgow, and afterward studied at the University of Leyden. Having been licensed as a preacher, in 1747 he was presented to the parish of Inveresk, in Mid Lothian, where he continued to the end of his life. He was one of the leaders of the Moderate party in the Scottish Church, the party which, during the latter half of the 18th century, ruled with such predominating sway, and included the names of Robertson, Blair, and Home among its members. As an eloquent debater and skilful

CARLYLE

ecclesiastical leader in the General Assembly he had no rival. He strenuously resisted all attempts to give additional influence to the popular element in ecclesiastical matters. He left behind him a well-known autobiography, which, though commenced in his 79th year, is a singularly interesting production, both from the vigor and sprightliness of its style, and the pictures which it presents of Scottish society in the 18th century. After remaining long in manuscript it was published in 1860, under the editorship of John Hill Burton.

Carlyle, Jane Baillie Welsh, Scottish letter-writer: b. Haddington, Scotland, 14 July 1801; d. London, 21 April 1866. She was the daughter of John Welsh, a Haddington surgeon, and was married to Thomas Carlyle (q.v.) 17 Oct. 1826. Her letters, edited by her husband, were published in 1883.

Carlyle, Thomas, Scottish critic and historian: b. Ecclefechan, Dumfriesshire, 4 Dec. 1795; d. Chelsea, London, 5 Feb. 1881. He was the eldest son of James Carlyle, a mason and afterward a farmer. James Carlyle was a serious, God-fearing man of great intellectual power, while his wife, Margaret Aitken, is represented to have been affectionate, pious, and intelligent. The elder Carlyle was a member of the dissenting body known as the Relief Church, and intended his son Thomas for a minister of this church, with which object he was carefully educated at the parish school and afterward at the burgh school of Annan. When only in his 15th year he was sent to the University of Edinburgh, where he studied under such professors as Leslie, Playfair, and Dr. Thomas Brown. Here he developed a strong taste for mathematics, a study in which he attained great proficiency. Having renounced the idea of becoming a minister, after finishing his curriculum in 1814, he became a teacher for about four years, first at Annan, afterward at Kirkcaldy, where he conducted the burgh school, and left behind him the character of an over-stern disciplinarian. At the latter place the celebrated Edward Irving (q.v.), whom he had first met during his school-boy days at Annan, was then also acting as a teacher, and the two became intimate friends. In 1818 he removed to Edinburgh, where he supported himself by literary work, devoted much time to the study of German, and went through a varied and extensive course of reading in history, poetry, romance, and other fields. His first literary productions were short biographies and other articles for the Edinburgh 'Encyclopædia,' an extensive work edited by Brewster. After three years of hard work and poverty in Edinburgh his health broke down, and he retired for a time to his father's farm in Dumfriesshire. He was next engaged to act as tutor to the sons of Mr. Buller, one of whom was afterward honorably known in public life. This post he held for about two years.

During this period his career as an author may be said to have really begun, with the issue in monthly portions of his 'Life of Schiller' in the London 'Magazine,' in 1823, this work being enlarged and published separately in 1825. In 1824 he published a translation of Legendre's Geometry, with an essay on proportion, by himself, prefixed, which Prof. De Morgan characterized as "thoughtful and ingenious, as good

a substitute for the fifth book of Euclid as could have been given in the space." The same year appeared his translation of Goethe's 'Wilhelm Meister's Apprenticeship.' This work, which like the others mentioned, was anonymous, was on the whole favorably received, though some critics objected to the translator's too great fondness for German idioms. During his tutorship he stayed some time in London, where Irving then was. He was next engaged in translating specimens of the German romance writers, published 1827. In 1826 he married Miss Jane Welsh, daughter of a doctor at Haddington, and a lineal descendant of John Knox. After his marriage he resided for a time in Edinburgh, and then withdrew to a farm in Dumfriesshire belonging to his wife, about 15 miles from the town of Dumfries. This place, Craigenputtock, he describes in a letter to Goethe, in 1828, as "the loneliest nook in Britain, an oasis in a wilderness of heath and rock, among the granite hills and the black morasses which stretch westward through Galloway almost to the Irish Sea." Here he wrote a number of critical and biographical articles for various periodicals, such as the 'Edinburgh Review,' the 'Foreign Quarterly,' and 'Fraser's Magazine'; and here was written 'Sartor Resartus,' the most original of his works, the one which first brought him fame, and which has had perhaps a greater influence on the minds of readers than any single work that could be named. The writing of 'Sartor Resartus' occupied portions of several years. It seems to have been finished in 1831, but the publishers were shy of it, and it was not given to the public till 1833-4, through the medium of 'Fraser's Magazine.' The whimsical title of this work (literally 'The Tailor Repatched') is a translation of that of an old Scottish song ('The Tailor Done Over'). The book professes to be an exposition for English readers of a new philosophy, the philosophy of clothes, first thought out and expounded by Diogenes Teufelsdröckh (Devil's Dirt, Asafetida), professor of things in general in the German university town of Weissnichtwo (Know-not-where, Scotch Kennahair); with biographical particulars regarding the professor, and miscellaneous thoughts, reflections, and speculations of his not strictly connected with his philosophy. The professor of course is really Carlyle himself, and the work is to some extent autobiographical. It is inspired by a distinctly didactic purpose, preaching through its wonderful intermixture of the humorous, the grotesque, the sublime, the pathetic, the solemn, the profound, welded together by a poetic or even a prophetic spirit, the doctrines of truthfulness, obedience, duty, work, and, above all, hatred of sham.

The publication of 'Sartor' (to which no author's name was originally attached) soon made Carlyle famous, and on his removal to London early in 1834 he became a prominent member of a brilliant literary circle embracing John Stuart Mill, Leigh Hunt, John Sterling, Julius Charles, and Augustus William Hare, Maurice, and his old pupil Charles Buller. He fixed his abode at Cheyne Row, Chelsea, where his life henceforth was mainly spent. His next work of importance was on the French Revolution, published in 1837. This, though a work of immense research, is hardly a history in the ordinary sense of the term; it is rather a series

THOMAS CARLYLE.

of powerful pictures, in which we see taking place the chief events and are made intimately acquainted with the chief actors of that stormy period. Of it the 'Westminster Review' remarked, "No work of greater genius, either historical or poetical, has been produced in this country for many years." The first volume of the 'French Revolution,' while still only in MS., was unfortunately burned while in John S. Mill's possession, and the author had immediately to set to work and write it over again. About this time, and on one or two subsequent years, he delivered several series of lectures, the most important of these, 'On Heroes and Hero-worship,' being published in 1840. 'Chartism,' published in 1839, and 'Past and Present,' in 1843, were small works bearing more or less on the affairs of the time. In 1845 appeared his 'Oliver Cromwell's Letters and Speeches, with Elucidations,' a work of great research, and brilliantly successful in vindicating the character of the great Protector. In 1850 came out his 'Latter-day Pamphlets,' a series of tracts dealing with political subjects, and assailing with extraordinary vehemence, not to say virulence, the most prominent institutions and characteristics of modern England and its people. This work was very repulsive to many from the exaggeration of its language, and its advocacy of harsh and coercive measures. He next wrote a life of his friend John Sterling, published in 1851, and regarded as a finished and artistic performance.

The largest and most laborious work of his life, 'The History of Friedrich II. of Prussia, called Frederick the Great,' next appeared, the first two volumes in 1858, the second two in 1862, and the last two in 1865, and after this time little came from his pen. His choice of Frederick as a hero strikes most people as a little remarkable, a feeling that the author was himself prepared for. He gives as his reasons for selecting him for historical treatment that he was the man that did almost the only real and substantial work in his century; that there was nothing of the hypocrite or sham about him; and that "How this man, officially a king withal, comported himself in the eighteenth century, and managed *not* to be a liar and charlatan as his century was, deserves to be seen a little by men and kings, and may silently have didactic meanings in it." He is reported to have said in conversation that he had tried to put a little humanity into Frederick, but found it hard work. Of the immense labor and research shown in this work, of the descriptive and narrative power displayed on almost every page, of the vividness with which a portrait is drawn, or an event put before us, it is almost impossible to speak too highly. At the same time it can hardly be denied that too often the author's powers as a skilled advocate have been enlisted in favor of "Vater Fritz" and his doings. Frederick the Great was soon translated into German, and has naturally been popular in Germany.

In 1866, having been elected lord rector of Edinburgh University, he delivered an installation address to the students 'On the Choice of Books.' While still in Scotland the sad news reached him that his wife had died suddenly in London. This was a severe blow to Carlyle. Mrs. Carlyle, besides being a woman of exceptional intellect, was a most devoted and affectionate wife. On her tombstone beside the ab-

bey church of Haddington he has recorded her virtues and his sorrow for her loss, stating that at her death his light was as if gone out. From this time his productions were mostly articles or letters on topics of the day, including 'Shooting Niagara; and After?' in which he gave vent to his serious misgivings as to the results of the Reform Bill of 1867. An unimportant historical sketch, 'The Early Kings of Norway,' appeared in 1874, but was written long before. Carlyle died at Chelsea, and was buried at Ecclefechan. He left the estate of Craigenputtock to the University of Edinburgh, settling that the income from it should form ten bursaries to be annually competed for—five for proficiency in mathematics and five for classics (including English). In 1881 Carlyle's 'Reminiscences' connected with the earlier part of his life were published by J. A. Froude, who also published a biography of Carlyle (1882-4, 4 vols.), and edited the 'Letters and Memorials of Mrs. Carlyle' (1883). In the last-named year was published the 'Correspondence of Carlyle and Emerson' between 1834 and 1872.

Carlyle's command over the English language was greater than that of almost any other prose writer, and his style was unique. It has been called unnatural, a distortion of the English language, a mere literary device or affectation to attract notice; but this is but a superficial criticism. That it is often eccentric, often uncouth, often rugged, often extravagant, may be admitted; but one who studies it cannot but recognize that it was so only as being the natural vehicle of expressing his thoughts. It grew and developed as the writer grew and developed, and in his hands was an instrument of unsurpassable power. Lowell has said of him, "Though not the safest of guides in politics or practical philosophy, his value as an inspirer and awakener cannot be overestimated. It is a power which belongs only to the highest order of minds, for it is none but a divine fire that can so kindle and irradiate. The debt due him from those who listened to the teachings of his prime for revealing to them what sublime reserves of power even the humblest may find in manliness, sincerity, and self-reliance, can be paid with nothing short of reverential gratitude." See Wylie, 'Thomas Carlyle: the Man and His Books' (1881); Masson, 'Carlyle Personally and in His Writings' (1885); Lives by Garnett (1887); Nichol (1894).

Carmack, Edward Ward, American politician: b. near Castilian Springs, Summer County, Tenn., 5 Nov. 1858. He studied law and after admission to the bar practised his profession at Columbia, Tenn. He was member of the State legislature in 1884; was on the editorial staff of the 'Nashville American,' (1886-8), and in 1892 became editor of the 'Memphis Commercial.' He served two terms in Congress as Democratic representative from the 10th Tennessee district 1897-1901, and in the year last named was appointed to the United States Senate.

Carmagnola, Francesco, frän-chës'kō kār-män-yō'la, Italian *condottiere*: b. Carmagnola, about 1390: d. Venice, 3 May 1432. His real name was Bussone, but he adopted as his own the name of his birthplace. The son of a peasant, he was a herdsman in his youth; but enlisting in the service of the Duke of Milan (Filippo Maria

CARMAGNOLE — CARMELITES

Visconti), he rapidly rose in rank, and aided his master in regaining a great part of Lombardy, and in extending his possessions. The Duke, however, became suspicious of his loyalty, confiscated his property, cast his wife and children into prison, and banished him; upon which Carmagnola entered the service of the republic of Venice, from which he received the appointment of generalissimo. He wrested Brescia from the Duke of Milan, and entirely routed his army at the battle of Macalo in 1427. After the battle he released his prisoners, which was frequently done at that time by *condottieri*, but incurring the suspicions of the Venetian senate for doing so, and his subsequent military operations not proving successful, he was recalled to Venice, under the pretext that his advice was needed for affairs of state, placed under arrest, accused of treason, put to the torture and beheaded.

Carmagnole, kâr-mân-yôl, a name applied in the early times of the French republic (1792-3) to a song which was accompanied by a dance. The song contained 13 couplets and the following refrain:

"Dansons la carmagnole
Vive le son, vive le son
Dansons la carmagnole,
Vive le son du canon."

The appellation originated, probably, from the name given to a peculiar form of vest worn by the confederates of Marseilles, who came to Paris in August 1792, to co-operate with the revolutionaries of the capital. The author and composer of the song are unknown. It is notable simply for its historical associations; not for the intrinsic merits of words or music. The song and dance were first used at the time of the indignation of the people on account of the veto allowed to the king on the resolves of the National Assembly. The Carmagnole was commonly sung and danced at popular festivals, executions, and eruptions of popular discontent. Afterward the name was also applied to the national guards, who wore a dress of a peculiar cut, and to the enthusiastic supporters of the Revolution. Several members of the National Convention—Barère, for instance—by way of jest, gave this name to their communications to the assembly.

Car'man, Elbert S., American editor: b. Hempstead, N. Y., 1836; d. New York, 28 Feb. 1900. He was graduated at Brown University in 1858, began contributing to the 'Turf, Field, and Farm' and similar publications early in life, and became owner and editor of the 'Rural New Yorker' in 1876. In connection with the last publication he established a farm at River Edge, N. J., where he gave much of his time to testing new plants, vines, and seeds, and also to originating new varieties of vegetables, fruits, and grains.

Carman, Ezra Ayers, American military officer: b. Metuchen, N. J., 27 Feb. 1834. He was graduated at the Western Military Institute, Kentucky, in 1855, and was assistant professor of mathematics in the University of Nashville in 1855-6. He served through the Civil War in the Army of the Potomac and the Army of the Cumberland; and attained the rank of brigadier-general of volunteers. He was comptroller of Jersey City in 1871-5; clerk in the United States Department of Agriculture in 1877-85; and a member of the Antietam Battlefield Board.

Carman, William Bliss, Canadian poet and journalist: b. Fredericton, N. B., 15 April 1861. He was educated at the universities of New Brunswick, Edinburgh, and Harvard, and has since done much journalistic work for New York and Boston papers. His verse has been widely read and his successive volumes include: 'Low Tide on Grand Pré' (1893); 'A Sea Mark' (1895); 'Behind the Arras' (1895); 'Ballads of Lost Haven' (1897); 'By the Aurelian Wall' (1897); 'Songs from Vagabondia,' joint author with R. Hovey (1894); 'More Songs from Vagabondia' (with Hovey) (1896); 'Last Songs from Vagabondia' (with Hovey) (1900); 'A Winter Holiday.' In 1903 he became editor of 'The Literary World.'

Carmarthen, kar-mâr'thên, or **Caermarthen** (Welsh, *Caer Fyrddyn*), South Wales, a seaport town, capital of Carmarthenshire, 9 miles from Carmarthen Bay, Bristol Channel, and 14 miles northwest of Llanelly, on the right bank of the Towy. The principal buildings are the county hall, St. Peter's church, and St. David's church. Besides the established churches there are numerous places of worship belonging to other denominations. Of public and private schools the most prominent are the South Wales Training College, Sir Thomas Powell's Free Grammar School, Queen Elizabeth's Grammar School, etc. There are also two infirmaries and a literary and scientific institution. There are some tin and lead works, cloth manufactories, and iron foundries, and the salmon fishery is extensive. Pop. (1901) 9,935.

Carmarthenshire, or **Caermarthenshire**, South Wales, a maritime county, and the largest of all the Welsh counties; extreme length, 53 miles; breadth, 35 miles; area, 594,405 acres. It is mountainous generally, but not so rugged as some other Welsh counties. Some of the vales are beautiful, particularly that of Towy, which is 30 miles in length. The principal river, the Tywi or Towy, rises in Cardigan-shire. This river and the Tave are the only navigable streams in the county. The valleys are fertile, and numerous herds of small black cattle are raised on the hills. The mineral products of the county are iron, lead, coal, and limestone. There are few manufactures. Pop. (1901) 135,325.

Carmaux, kâr-mô, France, a city in the department of Tarn, nine miles northeast of Albi by rail. It is one of the great coal-mining centres of France, the annual output of coal sometimes reaching as much as 600,000 tons. Serious strikes and riots took place here in 1892.

Car'mel, a mountain ridge in Palestine, constituting part of Lebanon, on the southern frontier of Galilee, in the pashalic of Acca. It consists of several rich, woody heights, separated by fertile and habitable valleys within a circuit of about 28 miles, and terminates at the mouth of the Kishon in a lovely plain, which forms the southern coast of the Gulf of Ptolemais or Acca, on the Mediterranean. Upon different parts of this mountain there are ruins of churches and monasteries from the time of the Christian kingdom of Jerusalem, and the cave which, according to tradition, was inhabited by the prophet Elijah.

Car'melites, one of the four mendicant orders of the Roman Catholic Church; its full

CARMEN — CARMICHAEL

title is Friars of Our Lady of Mount Carmel. The order has, traditionally, a very ancient origin, but as a religious order approved by the Roman Catholic Church is contemporary with the Dominican and Franciscan orders. According to the legends the Carmelites trace the origin of their order back to the early days of the kingdom of Israel, the time of the prophets Elijah (Elias) and Elisha (Elisæus). Elias, in his early manhood, says the legend, retired for religious contemplation to Mount Carmel, and there, taught by an angel, gathered to himself a number of men of like disposition, and instituted a society of contemplatives for worship of the true God and the attainment of spiritual perfection. Among the disciples attracted to this school of religion were the youths who afterward were the minor prophets Jonah, Micah, and Obadiah; and at a later period the renowned philosopher of Magna Græcia, Pythagoras, was numbered among the inquirers after the true religion and the science of divine things in this great school of the prophets: Pythagoras' instructor was the prophet Daniel. Elijah's wife instituted an order of female recluses. As pointing to the existence on Mount Carmel of some such institution as the legend postulates, reference is made to 1 Kings xviii. 19 and following; 2 Kings ii. 25; and 2 Kings iv. 25.

The world outside the precincts of those religious communities appears to have been entirely ignorant of this ancient institution till early in the 13th century, when Phocas, a Greek monk of Patmos, brought to the Latin patriarch of Constantinople intelligence of the existence in olden time of a great monastic or eremitic establishment on Mount Carmel, of which traces still remained. The site of the ancient ruins was occupied by a venerable monk from Calabria and 10 companion monks; and for these Phocas petitioned the patriarch to formulate or to approve a rule of monastic or eremitical life. This was done, and afterward the rule was approved by Pope Honorius III. in 1224. The connection of this order with the ancient school of the prophets, even if the traditional story be accepted, seems to lack proof. All that we are told which could give color to the claim that the new eremites are in the line of succession from the eminent school of prophets is, that in a vision Elias gave orders to the monk from Calabria to found a religious establishment on the ancient site. The community was expelled by the Saracens from its seat on Mount Carmel and took refuge in the west. One of the earliest houses of the Carmelite order in the west was founded at Alnwick in England; and about the same time, near the middle of the 13th century, St. Louis, the king, founded at Paris the first Carmelite house in France—the *Carmes*, of terrible celebrity in the great Revolution. Pope Innocent IV. modified the rule of the order and assimilated it to the Dominican and Franciscan rule. One of the traditions represents Jesus and his mother as initiates of the ancient order; and Saint Simon Stock, sixth general of the order, an Englishman, received from the hands of the Virgin the scapulary of Mount Carmel with the assurance that whoso should die wearing that scapulary would surely not be damned. A relaxation of the primitive severity of the rule was permitted by Eugenius IV. in 1431, and

this led to a scission of the order into two sub-orders, the Conventuals or Calced (wearing shoes) and the Observants or Discalced (shoeless or barefooted). Pope Benedict XIII. in 1725 permitted the order to add to the statues in Saint Peter's Church of founders of religious orders, one to their founder, which was erected with the inscription: "Universus Ordo Carmelitarum Fundatori suo Sancto Eliæ prophetæ crexit" ("The whole order of the Carmelites erected this statue to their founder, Saint Elias, the prophet"). The order of Carmelite nuns dates from the middle of the 15th century. In 1562 the great mystic Saint Teresa, who was a Carmelite nun, in virtue of a papal brief established a separate branch of the sisterhood, under a very severe rule: these are the Barefoot Carmelite Nuns. She then undertook to restore in the original order of Carmelite Friars the ancient severity of discipline, and succeeded; the result is the order or suborder of the Barefoot or Discalced Carmelites. The Carmelite order, in its several forms, has establishments all over the world. The headquarters of the order in America are at Niagara Falls.

Carmen, a novel by Prosper Mérimée, published in 1847. Don José Lizzarrabengoa, Navarrese and corporal in a cavalry regiment, meets at Seville a gypsy known as Carmen. While taking her to prison for a murderous assault on another woman, he connives at her escape, and is reduced to the ranks. Jealous, he kills his lieutenant, and joins a band of smugglers. In a duel he kills García, her *rom* or husband, and becomes her *rom* in turn. He offers to forget everything if she will go with him to America. She refuses, for the sake of another lover, as he believes, and he threatens to kill her. She answers that it is so ordained, but that "free Carmen has been, and free she will always be." Don José kills her, buries her body in the woods, rides to Cordova, and delivers himself to the authorities. The romance is best known in its operatic version, the adaptation having been made by Meilhac and Halévy.

Carmen Sylva, pen name of ELIZABETH, queen of Rumania (q.v.).

Carmi, Ill., a city and county-seat of White County, 150 miles southeast of Springfield, on the Little Wabash River. It is the centre of an agricultural region and exports fruit, grain, flour, tile, and lumber. It has flouring and saw mills, brick works, machine shops, etc. Pop. (1900) 2,939.

Carmichael, kâr'mî-kāl, **Frederic Falkner**, Irish clergyman and author: b. 1831. He was educated privately, and entering the Anglican ministry in 1857 held several church preferments in Dublin, becoming a canon of Christ Church Cathedral, Dublin, 1886. He has published: 'Jesus Christ, the Way, the Truth, the Life'; 'Donellan Lectures' (1876); 'The Responsibilities of God'; 'All Men Shall at Length be Saved'; 'The Ghost of Samuel.'

Carmichael, Montgomery, English civil servant: b. Birkenhead, England, 17 May 1857. He was educated at Bonn and Munich and entered the English consular service in 1890. In 1892 he was appointed vice-consul at Leghorn, and he has been vice-consul for West Tuscany from 1896. He is a regular contributor to the 'Saturday Review,' and has published 'Sketches and Stories, Grave and Gay' (1896); 'In Tus-

CARMINATIVES — CARNARVONSHIRE

cany,' a delightfully sympathetic description of Tuscan life (1901); 'The Lady Poverty' (1901); 'Life of John William Walshe,' a strongly conceived piece of imaginary biography (1902).

Carminatives, remedies that cause a warm, pleasant sensation in the stomach and act as stimulants to the muscles, causing peristalsis, thus relieving flatus; and that increase the flow of the gastric and intestinal secretions. Most of the drugs containing volatile oils are carminatives; as, the mint family, parsley, anise, fennel, caraway, cardamom, ginger, cinnamon, cloves, etc. See VOLATILE OILS.

Car'mine, the most splendid of all the red colors, is made from the cochineal insect, or *Coccus cacti*. The finest is that which is thrown down from an aqueous infusion by chloride of tin. This, after depositing, is collected and dried. The operations require the greatest care, for the brilliancy of the color is affected by the weather, light, and temperature. The color produced by alum has a darker tint, and constitutes lake. Carmine, or carminic acid, is also the name given by chemists to the coloring matter of cochineal. The acid is a purplish body, extremely soluble in water and in alcohol. It forms salts with the heavy metals, and it yields various products when acted on by chlorine, nitric acid, and other re-agents. Carmine is used to some extent in dyeing, in water-color painting, to color artificial flowers, confectionery, etc.

Carmo'na (ancient CARMO), a town in Spain, 20 miles from Seville, on a height overlooking a large plain covered with olive-trees. It is well built, containing many handsome mansions belonging to the nobility, who, though usually resident in Seville, spend part of the year here. The principal square is well planted, and, among other edifices, possesses a handsome Gothic church with a lofty spire. Another conspicuous object is a Moorish castle, flanked with massive towers, and there are two old Roman gates. The manufactures are chiefly woollen hats, leather, and earthenware. Recent important excavations on the site of the ancient necropolis, to the west of the modern town, have brought to light a large number of tombs and funeral triclinia in almost perfect preservation. Considerable portions of the Moorish wall and Alcazar still remain. Pop. (1903) 18,000.

Carmontel, kâr-môn-têl, or **Carmontelle**, Louis Carrogis, loo-ê kâr-rô-zhê, French poet: b. Paris, 15 Aug. 1717; d. there, 26 Dec. 1806. He is best known by his 'Proverbes Dramatiques' (10 vols.). These are without much connection in themselves, being, in fact, only a series of dramatic scenes, but are well adapted for private theatres. The fertility of Carmontel was as extraordinary as his ease in writing. He is said to have left, besides his printed works and his pieces for the theatre, more than a hundred volumes of manuscripts.

Carnac, kâr-nak, France, a village in the department of Morbihan, on a height near the coast, 15 miles southeast of Lorient, and remarkable for the so-called Druidical monuments in its vicinity. These consist of more than 1,100 rude blocks of gray granite, some of which are upward of 18 feet high, standing on end in the midst of a wide heath. They are in the form of

unpolished obelisks, with the vertex reversed, and are arranged in 11 lines, forming 10 avenues, with a curved row at one end. There are many gaps in the lines; almost every house and wall in the vicinity is seemingly built from this artificial quarry. They are evidently of very ancient date, but their origin is unknown. Pop. (1891) 2,901. See Lukis, 'Chambered Barrows and Other Historic Monuments in Morbihan' (1875); Miln, 'Excavations at Carnac' (1877-81).

Carnahuba. See CARNAUBA.

Car'nall, Rudolph von, German mining engineer: b. Glatz, 1804; d. 1874. He began the study of mining in Berlin in 1823, was connected with the mining industry in Upper Silesia and rose to be superintendent of mines and director of the general mining office in Breslau. He took part in founding the German Geological Society, lectured at the University of Berlin on the science of mining engineering, and rendered important service to the development of German mining.

Car'nallite, a hydrous chloride of potassium and magnesium, found at Stassfurt, Prussia, and of great commercial importance as being one of the minerals from which come the world's supply of potash salts. See POTASSIUM.

Carnarvon, kâr nâr'vôn, **Henry Howard Molyneux** (4th EARL OF), English statesman: b. London, 24 June 1831; d. 28 June 1890. He succeeded his father in the earldom in 1849, and was secretary of state for the colonies, June 1866 to March 1867. During his secretaryship he devised a scheme for the federation of the British North American Colonies, subsequently approved by Parliament. He was again colonial secretary, 1874-8, and lord-lieutenant of Ireland, 1885-6. He published 'The Druses of Mount Lebanon' (1860).

Carnarvon, or **Caernarvon**, Wales, a seaport town and parliamentary borough, on the southeast side of the Menai Strait, and capital of the county, 209 miles northwest of London. The ancient walls thrown around it by Edward I., and flanked by round towers, are still fairly entire. The magnificent castle or palace of Edward I., and in which Edward II. was born, stands at the west end of the town, almost overhanging the sea, and is externally entire. Including its court-yards, etc., it covers about two acres of ground. There are extensive ironworks in the town, which supply machinery for steamers, etc. Pop. (1901) 9,760.

Carnar'vonshire, or **Caernarvonshire**, Wales, a maritime county having Carnarvon Bay on the west; Denbigh on the east; the island of Anglesea and the Irish Sea on the north; and Cardigan Bay on the south. Its extreme length, southwest to northeast, is about 52 miles; extreme breadth, 20 miles, although the greater portion of it does not exceed seven or eight miles on an average; area, 369,477 acres. This county is traversed throughout its whole length by lofty mountains, including the Snowdon range, whose highest peak is 3,557 feet above the sea. There are other summits varying from 1,500 feet to more than 3,000 feet. Dairy farming, and cattle, horse, and sheep breeding are the principal occupations of the farmer. The cattle and sheep are of a small breed. Lead and copper ores are found in the mountains south, and there are slate quarries at Bethesda,

CARNATION

CARNATIC — CARNEADES

Llanberis, and Nantlle, which have been extensively and profitably worked. Pop. (1901) 126,835.

Carnatic, kār-nāt'ic, former province of British India, on the east coast of the peninsula. Its limits were ill defined, but it is commonly thought to have extended from Cape Comorin to lat. 16° N., and from the coast line to an average of about 80 miles inland. It was formerly included in the dominions of the nabob of Arcot, and the contentions arising from a disputed succession first brought the French and English into collision, and ended by the subjugation of the Carnatic under the British influence, which was completely effected in 1801. The Carnatic as one of the wealthy provinces has been the cause of endless native warfare and bloodshed, by which, whoever was victor, the unhappy cultivator suffered in the end; as each successive ruler, feeling his tenure uncertain, cared only to make revenue while the power lasted, an example which was but too closely imitated by his unscrupulous ministers and officials. The Carnatic is now included within the administration of the presidency of Madras.

Carnation, a half-hardy perennial herb (*Dianthus caryophyllus*) of the natural order *Caryophyllaceæ*, a native of southern Europe. It has more or less erect stems with enlarged joints, linear opposite leaves covered with a bloom, and solitary, variously colored terminal perfumed flowers, which naturally appear during summer, but which are produced artificially by certain varieties throughout the year. The plant has been in cultivation for its flowers for more than 2,000 years, but not until the early years of the 16th century did its flowers become greatly differentiated from their original flesh tint, which suggested the popular name (Latin *carnatio*). So numerous became the varieties that systems of classification were adopted. The popular European system of to-day is: (1) "Selfs," flowers of one color; (2) flakes, flowers with yellow or white ground and striped with either rose, scarlet, or purple; (3) "bizarres," resembling flakes except that they are striped with more than one color; (4) "picotees," with white or yellow petals margined with red, etc. The summer-blooming carnations which suggested this classification are little grown in America, but are very popular in Europe. They seem to demand a moist, cool climate. The group most cultivated in America and known as perpetual-flowering tree, or monthly carnations, originated in France about 1840 as the result of crossing and selection. The first of these varieties imported into America is said to have arrived in 1868, since when the growing of carnations under glass as a crop has developed. The extent of the industry is very great and is steadily growing. According to the census report of 1900 the value of the carnation crop in 1899 was about \$4,000,000, produced in about 9,000 American commercial greenhouses.

Propagation of the monthly carnations is usually effected by means of cuttings of young stems. When well rooted they are potted in good soil and kept until late spring, when they are transplanted to the open ground or to the benches where they are to blossom. A winter temperature ranging between 50 and 55° at night and preferably only 10° higher during the day,

is desirable. At the end of the winter they are thrown away.

The most common insect pests of the carnation are the red spider and the green aphid. The red spider thrives best in dry atmosphere, and is most easily controlled by syringing with water and evaporating (not burning) sulphur in the greenhouse once a week for about five weeks, when the insects become troublesome. The green fly or green aphid seems to thrive under any ordinary conditions. It is usually fought with tobacco fumes or various extracts of tobacco. Three fungous diseases are often troublesome: Rust (*Uromyces caryophyllinus*), spot, or blight (*Septoria dianthi*), and anthracnose (*Volutella* sp.). These are largely prevented by judicious management, and when they occur may be controlled by destroying diseased plants and by spraying with Bordeaux mixture (see FUNGICIDE). Rust appears on the stems and leaves as blisters which break and expose brown spores. Spot consists of brown dots with black centres where the spores are borne. Anthracnose is characterized by grayish-brown spots. (Bailey, 'Cyclopædia of American Horticulture,' New York 1900-1902). Thirty-seven acres of land are devoted to the raising of carnations at a nursery in Los Angeles, California. Nine greenhouses, each 200 feet long and 15 feet wide, together holding 35 tons of glass, are used to raise the young plants.

Carnation (Latin, *caro*, *carnis*, "flesh"), in the fine arts, the coloring of the skin of the human body. The use of carnation requires very attentive study and great skill in the artist. It varies with the sex of the individual, with the classes and countries to which the subjects belong, with the passions, the state of the health, etc. The cheeks are, in a healthy subject, of a lively red; the breast, neck, and upper part of the arms of a soft white; the belly yellowish. At the extremities the color becomes colder, and at the joints assumes a violet tint, on account of the transparency of the skin. All these shades require to be softly blended. Two faults in carnation are chiefly to be avoided,—hardness, the fault of the masters of the 15th century, and too great weakness. Guido Reni not infrequently painted his flesh so that it appeared almost bloodless. The French school has gone farthest in this respect. The flesh of the followers of this school often looks like porcelain or wax. Titian and Rubens are unrivaled in carnation.

Carnauba, kār-nā-oo'ba, the Brazilian name of the palm, *Copernicia cerifera*, which has its leaves coated with waxy scales (whence the name wax-palm), yielding a useful wax by boiling. The fruit and pith are eaten, the leaves are variously employed, and the wood is used in building.

Carne'ades, Greek philosopher: b. Cyrene, Africa, 213 B.C.; d. 123 B.C. He studied first under Diogenes the Stoic, but subsequently attended the lectures of Egesinus, who explained the doctrines of Arcesilaus; and succeeding his master in the chair of the academy, he restored its reputation by softening the prevailing pyrrhonism and admitting practical probabilities. The doctrine of Carneades specifically was, that "as the senses, the understanding, and the imagination frequently deceive us, they cannot be the infallible judges of truth, but that from the im-

CARNEGIE

pression made by the senses we infer appearances of truth, which, with respect to the conduct of life, are a sufficient guide." He was a strenuous opposer of Chrysippus, and attacked with great vigor the system of theology of the Stoics. He was an advocate of free-will against the fate of the same sect, and urged just the same difficulties in reconciling divine prescience with the freedom of human actions as have divided some contending sects of Christianity. One of the most distinguished events of his life was his being joined in an embassy to Rome with Diogenes the Stoic and Critolaus the Peripatetic, in order to gain the mitigation of a fine levied by the Roman senate on the Athenians. This extraordinary embassy was successful, and Carneades so captivated the people by his eloquence, one day delivering a harangue in praise of justice, and on the next proving it to be an odious institution, that Cato the censor, fearful of its effect on the Roman youth, persuaded the senate to send the philosophers back to their schools without delay. In his latter years Carneades became totally blind; he died in his 90th year, continually complaining of the shortness of life, and lamenting that the same nature which composed the human frame could dissolve it.

Carnegie, Andrew, American iron-master, manufacturer and philanthropist: b. Dunfermline, Scotland, 25 Nov 1837. None even of the mighty makers of their own fortunes began closer to absolute zero; certainly none who have owed success not to fortunate speculations, but to steady labor, sagacity, and self-culture, the natural working of the highest powers on opportunities open to all and less to him than to most. His father owned a small hand-loom business, which was closed in 1848 by the competition of steam. He then emigrated to the United States and settled in Allegheny City, Pa. The 10-year-old child here became a bobbin-boy at 20 cents a day; his alertness in a few months brought him transference to an engine-room, his penmanship and arithmetic a chance to do clerical work. Next a telegraph messenger boy at Pittsburg (with a mother and younger brother to support from his slender wages); he promptly mastered telegraphy, was soon given a place as operator, and won himself extra earnings and experience in composition as a newspaper telegraph reporter. Superior fitness brought him the post of telegraphic train-despatcher to the Pennsylvania R.R.; then of secretary to its general superintendent, Col. Scott; and in 1860, when his chief became vice-president, Mr. Carnegie was made superintendent of the Western Division. Meantime his business fortune had opened with the tentative adoption by the road, through his agency, of the Woodruff sleeping-car system, in which he shrewdly embarked some borrowed money; his expert knowledge made it investment, not speculation; and his dividends went partially into oil lands around Oil City, selected with equal judgment. At the outbreak of the war, Col. Scott was made assistant secretary of war, and gave Mr. Carnegie charge of the eastern military railroads and telegraph lines, and of this department there was no complaint or scandal, and no breakdown except of Mr. Carnegie's health from overwork. He was also the third man wounded on the Union side, while removing obstructions from the Washington tracks.

Already a small capitalist, in 1862 the Pennsylvania road's experiments in replacing wooden with iron bridges led him to forecast the future monopoly of the latter, and organize the Keystone Bridge Works, which built the first iron bridge across the Ohio. To increase their profit by furnishing their own iron, he entered the field which has made him one of the industrial sovereigns of all time. The first step was the erection of the Union Iron Mills, furnaces and rolling mills; the last, after inspection of the Bessemer process in England, to establish it in this country in 1868. The story since is one of swift aggregation of plant on plant, till they have dominated their class, and become one of the chief industrial factors of the entire business world in this its greatest age. By 1888 he had acquired a controlling interest in his foremost rival, the Homestead Steel Works, and in seven other immense establishments centred around Pittsburg; in 1899 he consolidated all these into one giant structure, the Carnegie Steel Company; and in 1901 he retired from business life, transferring his company at a valuation of \$500,000,000 to be merged into one still vaster, the United States Steel Corporation, formed by J. Pierpont Morgan. His United States residence is in New York; his summer establishment at Skibo Castle, in the extreme north of Scotland.

Such supreme success, fairly won in a struggle with the world, is of course the result of a supreme individual genius not to be taught or explained; but as the amount of work any one man can do unassisted is a trifle, the chief instrumentality is always the faculty of organization. Mr. Carnegie himself once said that the organization *was* the business; that if striped at a blow of all his material property and business connections, but left his organization, in four years he would have re-established himself. But the organization is simply the men who work it, with their capacity of selecting capable subordinates, and understanding public needs and the means of supplying them; and this leaves the faculty of creating and sustaining it no nearer solution than before. In the last analysis it means a nicely accurate judgment of *men*, resulting from an intuitive gift informed and tested by long experience; and as men are not pawns, it implies the power of persuading them into and keeping them in alliance as well.

Always a generous and helpful man, he had definitely begun, a few years before his retirement, a new existence consecrated to public service, and to which he will owe enduring remembrance. Another generation would have forgotten the mere business man, however great; for after all it would have had steel from some source, if perhaps less cheaply; but it could not have had from lesser men, and would not have had from any, the splendid, judicious, and permanently useful gifts with which he has endowed it, and which no change of social ideals can render obsolete or harmful. No one has ever so royally returned to the public what he had (to its own benefit) drawn from the public. This is his own expressed conviction of duty; that "surplus wealth is a sacred trust to be administered for the highest good of the people," and that sometime "the man who dies possessed of millions free and ready to be distributed, will die disgraced." But he is equally

ANDREW CARNEGIE

CARNEGIE INSTITUTION — CARNEIA

emphatic in declaring that indiscriminate giving is mostly sheer mischief, and that no person and no community can be permanently helped except by their own co-operation. Therefore, every gift of his to a community is conditioned on the latter supporting it; and all those to institutions are thought out, and so bestowed that they forward the work without impairing the springs of public interest, or the ties to the public, which must after all be their permanent stay. These gifts are mostly not to charities in the current sense, relief of material distresses, for which the spirit of human brotherhood should be adequate; but for that mental and spiritual cultivation which should raise communities out of the lowest plane of social evils. An apparent exception, which, however, is not charity but justice and business sense, is the endowment of \$4,000,000 given for an annuity fund to the workers at Homestead. The remainder of his benefactions may be divided broadly into institutions for research and the discovery of fertile new ideas; those for teaching the best of ideas and their practical appliances already known; and those for storing the results of knowledge and creation and distributing them to the public—in a word, universities, colleges, and technical schools, and libraries. Even the organs he has presented to several hundred churches may be classed in this category; as he genially observed, he is willing to indorse unreservedly all the utterances of the organs, but not of the preachers. The total amount of his benefactions to date is upward of \$70,000,000, of which some \$55,000,000 has been given in the United States, and with much more ultimately assured. The greatest single foundation will be the Carnegie Institute at Pittsburgh, an enormous technological school, with library, art gallery, and every imaginable accessory,—the people's college of what he thinks the coming type,—which has received \$10,000,000 already and is promised \$25,000,000 in all. Next is the Carnegie Institution (q.v.) at Washington, to promote original research and enable original workers to use their whole time for study, experiment, and creation; perhaps his most valuable benefaction ultimately, since new ideas are at once the scarcest and the most valuable items of the world's income, and the work of one great man outweighs that of 10 generations of small ones. Of the others, perhaps the most useful, considering the work, and the chief, is the gift of \$600,000 to the Tuskegee Normal and Industrial Institute in Alabama, conditioned on the trustees using enough of its income annually to free Booker T. Washington, its head, from money cares and the need of "drumming" support for his college the rest of his life, and enable him to devote his whole time to this noble institution. Sixty-five libraries in New York have received \$5,200,000; one in St. Louis \$1,000,000, and two in Detroit and San Francisco \$750,000 each; libraries at Homestead, Braddock, and Duquesne \$1,000,000; and the universities in his native Scotland \$10,000,000.

Mr. Carnegie has also won fame as an author, in addition to his other distinctions; and the public appreciation has been evinced in the emphatic and unfeigned form of a large unaided sale. His first works, 'Notes of a Trip Around the World' (1879) and 'Our Coaching Trip' (1882), were printed first for private circulation, but published in consequence of the great

pressure for private copies. 'An American Four-in-Hand in Britain' (1883) and 'Round the World' (1884) followed; but his greatest success was attained with 'Triumphant Democracy' (1886), which sold 40,000 copies within two years. 'The Gospel of Wealth' (1900) and 'The Empire of Business' (1902) have maintained his reputation as a clear, forcible, and interesting writer.

Carnegie Institution, an educational body incorporated 4 Jan. 1902, in Washington, D. C., by John Hay, secretary of State; Edwin D. White, justice of the supreme court; Daniel C. Gilman, ex-president of Johns Hopkins University; Charles D. Walcott, superintendent of the United States Geological Survey; Dr. John S. Billings, director of the New York Public Library; and Carroll D. Wright, United States commissioner of labor. The aims of the university as expressed by the founder are: (1) To increase the efficiency of the universities and other institutions of learning throughout the country by utilizing and adding to their existing facilities, and by aiding teachers in the various institutions for the experimental and other work in these institutions as far as may be advisable; (2) to discover the exceptional man in every department of study, whenever and wherever found to enable him by financial aid to make the work for which he seems especially designed his life work; (3) to promote original research, paying great attention thereto as being one of the chief purposes of this institution; (4) to increase the facilities for higher education; (5) to enable such students as may find Washington the best point for their special studies to avail themselves of such advantages as may be open to them in the museums, libraries, laboratories, observatory, meteorological, piscicultural, and forestry schools and kindred institutions of the several departments of the government; (6) to insure the prompt publication and distribution of the results of scientific investigation, a field considered to be highly important.

The board of trustees elected by the corporators of the institution was as follows: The President of the United States (ex-officio), the president of the United States Senate, the speaker of the House of Representatives, the secretary of the Smithsonian Institution, the president of the National Academy of Sciences, and Grover Cleveland (New Jersey), John S. Billings (New York), William N. Frew (Pennsylvania), Lyman J. Gage (Illinois), Daniel C. Gilman (Maryland), John Hay (District of Columbia), Abram S. Hewitt (New Jersey), Henry L. Higginson (Massachusetts), Henry Hitchcock (Missouri), Charles L. Hutchinson (Illinois), William Lindsay (Kentucky), Seth Low (New York), Wayne McVeagh (Pennsylvania), D. O. Mills (California), S. Weir Mitchell (Pennsylvania), W. W. Morrow (California), Elihu Root (New York), John C. Spooner (Wisconsin), Andrew D. White (New York), Edward D. White (Louisiana), Charles D. Walcott (District of Columbia), and Carroll D. Wright (District of Columbia).

The trustees assembled in Washington on 29 Jan. 1902, received from Mr. Carnegie the deed of gift of \$10,000,000, and elected Daniel C. Gilman, LL.D., president of the institution.

Carne'ia, a national festival of the ancient Spartans celebrated in honor of Apollo, and in

CARNELIAN — CARNIVAL

the Spartan month Carneios. The festival lasted nine days, during which the Spartans were not allowed to enter upon a hostile campaign.

Carnelian, a beautiful, translucent chalcedony (q.v.), usually of rich brownish-red color, though sometimes brown or more rarely yellow. Some of the finest Greek and Roman intaglios and seal rings are of carnelian or sard, which is a brownish-red or dark-brown carnelian. Sardonyx (q.v.) or sard with a white top, is cut into beautiful cameos. Fine carnelians come from Nova Scotia, Brazil, Uruguay, Arabia, and India. Cambay, in Hindustan, is a noted market for the Indian stones. The native jewelers, like the lapidaries of Idar (see AGATE), intensify the colors by baking the stones in the sun for several weeks and then in ovens.

Carneri, Bartholomäus von, bär-tō-lō mā'oos fōn kār-nä'rē, Austrian poet and politician: b. Trent 1821. His volume of poems 'Plough and Sword' was greatly admired. He has published 'Foundation of Ethic' (1881); 'Der Moderne Mensch' (1900); etc.

Carnifax Ferry, W. Va., place at which occurred a battle of the Civil War, 10 Sept 1861. On 23 August Gen. John B. Floyd, who had marched from Lewisburg, crossed to the north side of Gauley River at Carnifax Ferry with five regiments of Virginia infantry, 100 cavalry, and five guns, aggregating about 2,600 men. The 7th Ohio had been guarding the ferry, but had been recalled to within six miles of Gauley Bridge, and then ordered to return to Cross Lanes, two miles from Floyd's position, which it reached in the night of the 25th. Early on the morning of the 26th Floyd advanced, surprised the regiment while at breakfast, and routed it, killing and wounding 45 and capturing 96. About 200 men escaped to Gauley Bridge and about 400 were collected and led by Major Casement to Charleston on the Kanawha. Floyd's intention in crossing the Gauley was to force the retreat of Gen. J. D. Cox from Gauley Bridge down the Kanawha Valley, whither he proposed to follow him and make a raid of 50 miles into Ohio, but Gen. H. A. Wise, who commanded one of his two brigades, had refused to obey his order to cross the Gauley, upon which Floyd abandoned his idea of invading Ohio, and intrenched his position in a bend of the Gauley, both flanks resting on the precipices rising abruptly from the river. The presence of Floyd north of the Gauley gave Gen. Rosecrans some uneasiness, and turned his attention from the Cheat Mountain region where he had been confronting Gen. R. E. Lee. Leaving Gen. J. J. Reynolds to oppose Lee, he drew troops from posts in the rear and assembled at Bulltown seven and a half regiments of Ohio infantry, two batteries of artillery and three companies of cavalry, which were formed into three brigades, commanded by Gen. H. W. Benham, and Colonels E. P. Scammon and R. L. McCook. On 9 September he marched from Bulltown, crossed Big Birch Mountain, drove the 36th Virginia and a company of cavalry from Summersville, on the morning of the 10th, and followed to Cross Lanes, which he reached at 2 p.m., and heard that Floyd was intrenched about two miles distant. Benham, commanding the leading brigade, was ordered to advance cautiously and feel Floyd closely, but not to engage him until the entire column came up,

unless he saw a good opening. Benham drove in Floyd's pickets, and believing that he was in full retreat, pushed rashly forward in the face of a severe artillery fire, becoming closely engaged and making some spirited charges upon Floyd's works, which were repulsed. He then called for help. Rosecrans hastened up the brigades of Scammon and McCook, and going to the front, was surprised that the reconnaissance ordered had developed into a severe and badly conducted engagement. It was too late to withdraw without giving the appearance of defeat; other efforts were made, in which Scammon and McCook participated; but it was growing dark, the men were exhausted after their march of 17 miles, and Rosecrans withdrew, intending to renew the fight in the morning. During the night Floyd recrossed the Gauley, destroyed the foot-bridge behind him, sunk the ferry-boat and, with Wise, retreated to Sewell Mountain. The Union troops, fully exposed and not well handled, had 17 killed and 141 wounded. The Confederates, well protected by log-works, had none killed and 21 wounded. Consult Official Records, Vol. V.

E. A. CARMAN.

Carnio'la (German, KRAIN), a province of Austria, with an area of 3,856 English square miles. It is covered with lofty mountains, some of which are about 10,000 feet high, and, generally speaking, is one of the most unfertile regions of the empire. Some districts, however, produce considerable quantities of wheat, barley, wine, and, in the south, fruits of various kinds, and excellent flax. There are some iron, lead, and quicksilver mines, the latter exceedingly rich. It abounds in clays and valuable stones, and in coal and marble. There are considerable manufactures of iron, fine linen, lace, woolen cloth, flannel, worsted stockings, leather, wooden articles, etc. Its chief exports are steel-ware, quicksilver, hats, linens, glasswares, wax, wine, flour, etc.; principal imports—salt, oil, fruit, coffee, sugar, tobacco, cloths, cattle, etc. Carniola was made a duchy in the 12th century, under the dominion of the Counts of Tyrol, who became extinct in 1335, and were succeeded by the Earls of Goerz. After the treaty of Vienna, in 1809, it was ceded to France, and incorporated in the kingdom of Illyria. In 1814 it came again into the possession of Austria. Capital, Laibach. Pop. (1900) 508,348.

Car'nival. The same views which led men to propitiate the higher invisible powers by gifts, sacrifices, and purifications, also introduced fasts, abstinence from pleasure, and penances. By fast is meant an abstinence from the usual means of nourishment, in order to mortify the appetites, and thereby to propitiate the Deity. In every nation of importance customs of this kind are found. Their historical origin is in the religious customs of the East, where the priests were originally the physicians of the people, and prescribed these fasts as a part of the regimen necessary in this warm region, as well as from religious views. Fasts are observed to this day in the East. The religions of the Persians and the Hindus, those of the Mohammedans, and of the worshippers of the Lama, insist much on fasts. Few traces of them are found in the religion of the ancient people of the North. The earliest Christians fasted on the vigils (q.v.).

CARNIVORA

The fasts on the *jejunia quatuor tembestatum*, which continued for three days every quarter of the year, were penances, as was that of the period of 40 days (before Easter, or rather before Good Friday, *Quadragesima*),* which was called, by way of excellence, the fast, and which commemorated the 40 days' fast of Jesus in the wilderness. With regard to the origin of Christian fasts, opinions differ. The most common is, that Telesphorus, bishop of Rome, in the middle of the second century, first instituted the 40 days' fast as a rule of the Church. By Pope Gregory the Great, about 600, Ash Wednesday was made the beginning of the fast, and the day before was called fast eve, because in the night of this day, at twelve o'clock, the fast began. This fast was preceded by a feast of three days, very obnoxious to the strict zealots. "Christians," it is said, "on these days deliver themselves up to voluntary madness, put on masks, exchange sexes, clothe themselves like spectres, give themselves up to Bacchus and Venus, and consider all pleasure allowable." This is the origin of the present carnival, or *Fasching*, as it is called in the south of Germany, and which continues in that country from Twelfth Day to Ash Wednesday. The name carnival is derived from the Latin *caro*, *carnis*, flesh, and *vale*, farewell (according to Ducange, from the Latin denomination of the feasts in the Middle Ages, *carnis levamen*, solace of the flesh), because at that time people took leave of flesh. Previously to the commencement of their long abstinence, men devoted themselves to enjoyment, particularly during the last three days of the carnival. The carnival is nothing but the Saturnalia of the Christian Romans, who could not forget their pagan festivals. At least it greatly resembles the Saturnalia which were celebrated annually in December, with all kinds of mirth, pleasure, and freedom, in honor of Saturn, and the golden age when he governed the world, and to preserve the remembrance of the liberty and equality of man in the youth of the world. In Rome, the carnival brought to view, in a lively manner, the old Saturnalia in a new form. During the last days of the carnival, and particularly during the day which preceded the long fast, mummeries, plays, tricks, and freedom of every kind, abounded. From Italy, the modern Saturnalia passed to the other Christian countries of Europe. The wealthiest class commenced their amusements 8 or 10 days before Ash Wednesday, the middle classes 2 or 3 days, the poor only observed one day (the *Fastnacht* of the Germans). In the amusements of this period the dramatic poetry of Germany had its origin, after the cities had attained a flourishing condition. Its first traces appeared in the 13th century. The mummeries of the carnival produced the idea of adopting some character, and carrying it through. To please the multitude, and make the laugh more certain, the manners of common life were caricatured. These exhibitions afterward became more cultivated and developed. On fast eve persons in disguise sometimes went from one house to another, to make sport with their friends and acquaintances. A merry society of this kind formed a plan to represent some scene in their disguises, and hold a regular conversation at one of these mummeries. The unknown players received praises, entertainments, or presents. Encouraged by this success, the company grew stronger, their fables

and speeches became longer by degrees, until they attained to regular representations of human life. It was in Nuremberg, renowned for its wares and its wit, that the first fast eve's play was produced, coarse and frolicsome, to suit the taste of the citizens. The earliest of these pieces that have come down to us date from 1450-70; they have a near relationship to the masques of the English and the farces of the French, as have the spiritual fast eve's plays, religious burlesques, to the Mysteries and Moralities. In Italy the carnival is now celebrated with the greatest show and spirit at Rome. It lasts for the 10 days preceding Ash Wednesday, certain observances taking place on certain days. Some days, for instance, are devoted to the throwing of comfits, or of small plaster pellets that take their place, these being flung from the balconies of the houses upon the persons in the streets—especially in the Corso—who retaliate in the same way, and in order that they may do this many of them are mounted upon lofty cars or other vehicles, all being masked. On other days the finest equipages move along in procession, and flowers instead of comfits are thrown. Races of riderless horses in the Corso are another prominent feature of carnival time. After sunset on Shrove Tuesday everybody carries a lighted taper (these being known as *moccoletti*), and each tries to extinguish as many others as he can while keeping his own alight. Venice, Turin, Milan, Naples, Florence, etc., also celebrate the carnival with more or less ceremony, and the same can be said of various towns of the south of France, Nice in particular. The carnival at Rome has been excellently described by Goethe. In Germany the carnival is celebrated with brilliancy only in the Catholic cities of the Rhine valley, Mayence, Bonn, but above all Cologne. In Protestant countries, generally, the feast is not observed to any extent.

Carniv'ora, broadly, those animals which prey upon other animals; but in a restricted sense, that order of mammals to which the cat, dog, bear, and seal belong. The head is small in proportion to the bulk of the body, and the skin is well covered with hair. The limbs, four in number, are fully developed, and are adapted either for walking or swimming. Two sets of teeth, deciduous or milk and permanent, are always developed in succession, and in both sets incisors, canines, and molars, are distinguishable. The order is divided into two groups, the *Fissipedia*, which include such animals as the lion, wolf, bear, etc., whose life is terrestrial; and the *Pinnipedia*, or those which are specially adapted for aquatic life.

1. *Fissipedia*.—All the carnivores of this division, except the sea-otter (*Enhydra*), have six incisor teeth in each jaw, the canine teeth are prominent, and one of the molar series in each jaw is usually compressed laterally, so as to present a cutting edge. The toes are furnished with claws, and the anterior limbs are used for seizing and holding prey as well as for walking. The skull is contracted behind the orbits, so as to give an hour-glass form when seen from above. The hollow formed by this constriction on each side of the head is bridged over by the wide zygomatic arch, and thus gives room for the powerful muscles of mastication. The lower jaw is articulated to the skull, so that it can only be moved up and down. The incisor

CARNIVORA — CARNIVOROUS PLANTS

and canine teeth are represented by the formula $i \frac{3-8}{3-8}, c \frac{1-1}{1-1}$. The teeth behind the canines increase in size from before backwards, and vary from $\frac{4-4}{3-8}$ in the cat, to $\frac{6-8}{3-8}$ in the South African otocyon, the total number of teeth of all kinds ranging from 30 to 48. The posterior teeth are divided into premolars and molars; the last of the premolar series in the upper, and the first of the molar series in the lower jaw presenting the lateral compression and trenchant margin which earns for them the name of sectorial or carnassial teeth. Behind the carnassial the molars have tuberculated crowns. The stomach is simple and undivided, and, as a general rule, is more rounded in the flesh-eating genera. The limbs terminate in digits, which are never fewer than four, and are furnished with sharp claws, which in the *Felidæ* are retractile within sheaths of the integument on the dorsal surface of the toes. In walking, the extremities of the toes are applied to the ground, as in the "digitigrade" cat and dog; or the whole sole of the foot is put down, as in the "plantigrade" bear. The six families included under the fissipede carnivores are: (1) *Felidæ*: lion, tiger, leopard, cat, etc. These present the highest type of the carnivorous structure. The claws are retractile. (2) *Canidæ*: wolf, dog, jackal, fox, etc. The claws are not retractile, and the gape is longer. The toes in this and the previous family are five on the anterior and four on the posterior extremities; (3) *Hyenidæ*: hyæna, aardwolf, etc. The hyænas have the anterior limbs longer than the posterior, and both terminate in four toes. The skull and dentition approximate to those of the *Felidæ*; (4) *Viverridæ*. The supple elongated bodies of these animals are intermediate between those of the cats and the martens. Some, as the civet, genet, zibet, have the claws retractile; in others, as the ichneumon and rasse, they are not retractile. Those mentioned are digitigrade, but the suricate of central Africa is plantigrade. In this family glands are found under the tail, the secretions of which have powerful odors. The diet of this family is not purely animal. (5) *Mustelidæ*. The members of this family have elongated bodies with short limbs, terminating usually in five-toed feet with retractile or non-retractile claws. The marten, weasel, polecat, ermine, glutton, or wolverene, constitute one sub-family of exclusively terrestrial life. The badgers, the skunks, and the like, constitute another division. (6) *Ursidæ*. In this family the carnassial tooth is no longer trenchant, but tuberculated. All are plantigrade, but the habits and aspect vary considerably, and include, besides the bears, the raccoons, panda, and several lesser forms. The raccoon and its allies are sometimes made a family with the name *Procyonidæ*.

2. *Pinnipedia*.—The aquatic carnivores comprise three families, represented by the walrus or sea-horse, the eared seals, and the common seals. They are related to the preceding families through the otters and the bears, and agree in having the extremities modified into swimming organs or flippers, and the teeth more uniform in character. See SEAL; WALRUS.

Carnivora, Fossil. The evolution of the *Carnivora* through the Tertiary Period is shown by numerous fossil species. These indicate that the modern carnivores are descended from a

group of primitive *Carnivora* (see CREODONTA) of the early Eocene, and have gradually diverged from a single stock, of which the *Viverridæ*, or civets, are the nearest living representatives. From these the dogs branched out in one direction, the mustelines, hyænas, and cats in others, while the bears and raccoons are offshoots of primitive dogs. Many intermediate stages are known, between dogs and bears (as *Amphycyon*, *Hyanarctos*), dogs and raccoons (*Phlaocyon*), mustelines and civets (*Plesictis*, etc.), civets and hyænas (*Ictitherium*). No true *Carnivora* are found fossil in South America until the end of the Tertiary, and (with a single exception) none exist now in Australia. In both continents their place was supplied by carnivorous marsupials (see MARSUPIALS, FOSSIL), which branched out into groups more or less paralleling the true *Carnivora* of the northern hemisphere. See also BEARS; CATS; DOGS; FOSSIL.

Carnivorous Plants, plants of various genera which subsist partly upon insects and other small animals which they entrap in various ways. The apparatus in each case is a modified leaf or part of a leaf, and in some cases the modifications are so curious, so well adapted to the use to which they are put, and so perfect in action, that the plants seem almost intelligent. The object sought by these plants seems to be to supply themselves with nitrogenous food, which is generally in meagre supply where they usually live—undrained swamps. Probably, too, such plants as do not live in these habitats formerly did, but have not yet lost the use of the apparatus. A case of this kind is exhibited by the genus *Utricularia* (see BLADDERWORT). In this genus various species provided with active bladders, which act like cellophane traps, live submerged in ponds; other species, also possessing active but less perfect and useful traps, live in the marshy soil of swamps. Still others live on dry ground, but these have usually abortive traps. The conclusion is that as the ponds became swamps, and the swamps were converted into dry land, the supply of nitrogenous food increased, and hence the traps became aborted, because they were no longer needed.

Probably the most nearly intelligent of these carnivorous plants is the Venus' fly-trap (*Dionaea*), found in the southeastern United States. The trap consists of two pieces hinged together. On the margins are bristles, and in the interior a few sensitive hairs, which, when touched, act like a trigger, and the apparatus closes. Should an insect cause this action the bristles will prevent its escape and the trap will remain closed until its digestion is complete, when the trap will open, cast out the indigestible portions, and be ready for another victim. If the trap fails to catch its prey, or if it be sprung by something it cannot utilize, it will open again in a short time. In the sundew (*Drosera*) the leaves are provided with glandular hairs which close over the insect that alights upon the leaf, and a glistening sticky substance holds it fast until its digestible parts are absorbed by the plant.

In the pitcher-plants (*Sarracenia*, *Nepenthes*, etc.), the pitcher consists of a tube either with or without a lid or hood. Around the mouth there is usually a sugary secretion which acts as a lure. The insect that alights cannot escape

CARNOCHAN — CARNOT

because the tube is lined with hairs that force him downward to the bottom of the tube, which is usually partly filled with water. Some other genera in which the carnivorous habit is developed are *Darlingtonia*, *Aldrovandra*, and *Pinguicula*. Consult: Darwin, 'Insectivorous Plants.'

Carnochan, kār'nō-kān, John Murray, American surgeon, famous for his bold and skilful operations: b. Savannah, Ga., 4 July 1817; d. New York, 28 Oct. 1887. He studied at Edinburgh and at various European universities; and began his practice in New York in 1847. In 1851 he became professor of surgery at the New York Medical College, and surgeon-in-chief to the State Immigrant Hospital. At one time he cured neuralgia by excising the whole trunk of the second branch of the fifth pair of nerves. In 1852 he tied the femoral artery to cure exaggerated nutrition. He also tied the primitive carotid artery on both sides, to cure elephantiasis of the neck. In 1853 he excised the entire radius. In 1854 the entire ulna. He published a treatise on 'Congenital Dislocations,' and a translation of Rokitauský's 'Pathological Anatomy.'

Carnot, Lazare Hippolyte, lā-zār ē-pō-lēt kār-nō, French statesman, second son of the preceding: b. St. Omer, 6 April 1801; d. 16 March 1888. He was of liberal opinions, became a disciple of St. Simon, and wrote the 'Exposition générale de la doctrine Saint-Simonienne,' the authorship of which was, with his consent, ascribed to Bazard. But as soon as St. Simonism assumed the form of a religious creed, Carnot parted with his friends, and became a journalist, and the chief editor of the 'Revue encyclopédique.' He was also entrusted with the publication of Grégoire's and Barère's 'Mémoires.' He was elected to the chamber of deputies in 1830, and re-elected in 1842 and 1846. After the revolution of February 1848, he was minister of public instruction until 5 July, and improved, as such, the condition of the teachers, rendered the normal schools free, and established free lectures. In 1848 he was elected to the constituent, and 10 March 1850, to the legislative assembly. After the *coup d'état* of December 1851, he left France; during his absence, he was elected a member of the *corps législatif*, but refused to take the oath. He was re-elected in 1857, but again refused to serve. He published the memoirs of his father (1860-4).

Carnot, Lazare Nicolas Marguerite, lā zār nīk-ō-lā mār-gā-rēt, French soldier and statesman: b. Nolay, Burgundy, 1753; d. Magdeburg, 2 Aug. 1823. From his youth he exhibited an uncommon talent for the mathematical and military sciences, entered the corps of engineers, and rose in office by the favor of the Prince of Condé. He published, afterward, 'Mathematical Essays,' which caused him to be elected a member of several learned societies. His eulogy on Vauban received the prize of the Academy of Dijon. In 1791 he was appointed deputy to the constituent assembly, but at first took part only in military affairs. On his proposal the officers of the nobility were removed from the army, and others substituted from the citizens. He also proposed that implicit obedience should only be demanded of the soldier in presence of the enemy, at other times he should have all the

privileges and rights of the citizen; a strange proposal to come from a military chief. As a member of the convention he voted for the death of Louis. In the following March he was sent to the army of the north, where he put himself at the head and repulsed the enemy. On his return to the convention he was made a member of the Committee of Public Safety. The influence of Carnot in the military operations now began to be more deeply felt. In possession of all the plans deposited in the archives of Louis XIV., he organized and directed the French armies; and his direction undoubtedly contributed very much to their success. After the fall of Robespierre he was often accused, but always acquitted, because his duty had been to take care of the defense of the country, and he could not be made answerable for the cruel decrees of Robespierre, in which Carnot's name, as he was a member of the committee, was of course to be found. At the establishment of the directory in 1795 Carnot was chosen a member, and for some time maintained an important influence. Barras at length succeeded him in the department of war, and was ever after his enemy. His plan for the overthrow of Barras was unsuccessful, and with some others he was sentenced to transportation on the 18th Fructidor (Sept. 4) 1797. He fled to Germany and published a defense, which was eagerly read in Paris, and by the exposure of the conduct of his former colleagues hastened their overthrow on the 30th Prairial (June 18) 1799. After the 18th Brumaire Carnot was recalled, and appointed *inspecteur aux revues*, and two months later, in April 1800, minister of war. He soon after retired into the bosom of his family, but was called to the tribunate, 9 March 1802. He often opposed the views of the government, voted against the consulship for life, and his was the only voice raised against the proposal for the imperial dignity. He remained, however, a member of the tribunate till it was abolished, passed the next seven years of his life in retirement, and published several valuable military works. In 1814 Napoleon gave him the chief command at Antwerp. He connected a vigorous defense with a careful regard for the interest of the city, which, by the command of Louis XVIII., he afterward surrendered to the British General Graham. He still retained his titles and his honors, but as a firm republican he could never expect the favor of the court; particularly as, in his memorial to the king, he openly and severely censured the measures of government, in consequence of which he was passed over in the new organization of the Academy of Sciences. When Napoleon was once more at the helm of state in 1815, he made Carnot count and peer of the empire, and pressed upon him the ministry of the interior. Carnot discharged the difficult duties of this office with his usual integrity. After the emperor's second fall he was made a member of the provisory government of France, and was afterward the only one of the members of it comprehended in the ordinance of 24 July. He retired to Cerney, where he employed his pen on political subjects; then to Warsaw with his family; and finally to Magdeburg. Among Carnot's writings the most valuable are his 'Essai sur les Machines'; 'Réflexions sur la Métaphysique du Calcul infinitésimal'; 'Sur la Géométrie de Position'; 'De la Défense des Places fortes'; 'Ex-

posé de la Conduite politique de Carnot, depuis le 1^{er} Juill. 1814.' In Magdeburg Carnot published 'Mémoire sur la Fortification primitive,' and a volume of poems. He was rigid in his love of virtue, a scholar, a general, and an inflexible republican. He was universally esteemed, both in France and in foreign lands, and was honored by all parties.

Carnot, Marie François Sadi, mā-rē frānswa sa-dē, French president, grandson of Carnot (q.v.): b. Limoges, 11 Aug. 1837; d. Lyons, 24 June 1894. He was educated at the École Polytechnique and became a civil engineer. In 1871 M. Gambetta appointed him prefect of the Seine-Inférieure, and intrusted him with the duty of seeing to the defenses of his department, a task which he fulfilled with great ability. M. Brisson gave him the portfolio of public works in his cabinet of 1885, and in the following year he became minister of finance, retaining this post under Brisson's successor, De Freycinet. In 1887 he was elected president of the French republic in succession to M. Jules Grévy, but before his term of office had expired he was assassinated at Lyons by an Italian anarchist named Caserio.

Carnot, Nicolas Léonard Sadi, nīk-ō-lā lā-ō-nār sā-dē, French physicist: b. Paris 1 June 1796; d. there, 24 Aug. 1832. He was educated at the polytechnic school; in 1814 he entered the engineer corps, where he served until 1828, becoming captain in 1826. In 1824 he published his book, 'Reflexions sur la Puissance Motrice du Feu,' in which he laid down the principle that the efficiency of a thermodynamic engine is proportional to the amount of heat transferred from the source of heat to the condenser; and that heat passes only from a warmer to a colder body. This is called the second law of thermodynamics and is known also as Carnot's principle.

Carnotite, a mineral first described in 1899, and now one of the most important ores of uranium. It is a hydrous vanadate of uranium and potassium, its formula being, perhaps, $K_2O \cdot 2U_2O_5 \cdot V_2O_5 \cdot 3H_2O$. Radium has been shown to be present in it and radiographs may be made from the crude mineral. It seems likely that it will become an important ore of radium. It is a canary-yellow crystalline powder, usually occurring disseminated through sandstone, but sometimes in earthy masses of considerable richness. Its chief locality is in Montrose County, Colo., but it has recently been reported from Utah.

Carnuntum, an ancient Celtic town in the northern part of Pannonia, on the Danube, near where Hainburg now stands.

Caro, kā'rō, Annibale, Italian author: b. Citta Nuova, 1507; d. 1566. In 1543 he was appointed secretary to Pietro Ludovico Farnese, Duke of Parma and Piacenza, who entrusted him with several missions to Charles V. After the assassination of the Duke his own life was in considerable danger. He took refuge in Parma, and was treated in a friendly manner by the new Duke Octavio Farnese, whose two brothers, the cardinals, Ranuccio and Alexander, took him successively into their service. With the latter he remained from 1548 to his death in 1566, and received from him several ecclesiastical preferments. Caro devoted himself chiefly to the study of numismatics and the Tuscan language,

and his pure and elegant style in verse and prose soon became generally admired. His translation of the *Æneid* in blank verse is excellent. After his death appeared a translation by him of Longus, and of Aristotle's 'Rhetoric'; also 'Rime' (1569), and 'Lettere familiari' (1572-5), the former of which are admired for the elegance of the verse, and the latter as models of beautiful Italian prose.

Caro, Elme Marie, ělm mā rē kā-ro, French philosopher: b. Poitiers, 4 March 1826; d. 13 July 1887. He was a lecturer at the École Normale de Paris in 1857, professor at the Sorbonne 1867, and a member of the French Academy in 1876. He was one of the popular lecturers of his day and his lectures in defense of the Christian religion were largely attended, being especially popular with women. He published 'L'Idée de Dieu et ses nouveaux Critiques'; 'La Philosophie de Goethe'; 'La Matérialisme et la Science'; 'Etudes Morales sur le Temps présent'; 'Nelanges et Portraits.'

Caro, Jakob, yā kōb kā'ro, German historian: b. Gnesen, 2 Feb. 1836. He was educated at Berlin and Leipsic, traveled in Galicia and southern Russia, and in 1863 became lecturer at the University of Jena and later professor; in 1868 he was professor at Breslau. He has written 'Das Interregnum Polens 1856' (1861); 'Liber Cancellarie Stanislaw Ciolek' (1871-4); 'Lessing und Swift, Studien über Nathan den Weisen' (1869); 'Aus der Kanzlei Kaiser Siegmunds' (1879); 'Das Bündniss zu Canterbury' (1880); 'Beata und Halszka, eine Polnisch-Russische Geschichte aus dem 16. Jahr hundert.' (1880); and a continuation of Ropell's 'Geschichte Polens.'

Caro, Miguel Antonio, mē-gēl' ān-tō'nē-ō, Colombian prose-writer and poet: b. Bogotá, Colombia, 10 Nov. 1843. He has been an editor and contributor to periodicals. His principal works are 'Poems' (1866); 'Hours of Love,' a prose work; and a translation into Spanish verse of Virgil's complete works (3 vols. 1873-5). He is a correspondent of the Royal Spanish Academy, and in 1886 was national librarian in the Colombian Congress.

Carob, kā'rōb, or Algaro'ba-bean (*Ceratonia siliqua*), a leguminous plant of the sub-order *Casalpinia*, growing wild in all the countries bordering the Mediterranean, and more especially in the Levant. It has a dark-green foliage, and produces pods in which the seeds are embedded in nutritious pulp, of the taste and consistence of manna. The names "Iocust" and "St. John's bread" have been given to the legumes of this plant, from an idea that they were the food eaten, along with wild honey, by the Baptist in the wilderness. The legumes are sometimes imported into this country as food for horses, this being their principal use in the south of Europe and the north of Africa, where the plant is cultivated. Singers are said to chew the seeds for improving the voice.

Carøe, kā'rō, William Douglas, English architect of Danish parentage: b. Liverpool, 1857. He was educated at Trinity College, Cambridge, and studied architecture with the eminent architect, John L. Pearson. He is architect to Southwell Cathedral and to the Diocesan societies of Lichfield and Derbyshire, as well as to the dean and chapter of Canter-

CAROL — CAROLINA

bury. Among his principal works are the archbishop's palace at Canterbury, bishop's palace at Bristol; St. David's Church at Exeter; Wycombe Abbey School; and the Jubilee Monument to Queen Victoria at Mentone, France. He has also restored many buildings of historic interest.

Carol, a song of praise sung at Christmas or Easter. It originally meant a song accompanied with dancing, in which sense it is frequently used by the old poets. It appears to have been danced by many performers, by taking hands, forming a ring, and singing as they went round. It has been said that the oldest carol was that sung by the heavenly host when the birth of the Saviour was announced to the shepherds on the plains of Bethlehem. It is probable that the practice of singing carols at Christmas-tide arose in imitation of this, as the majority of the carols declared the good tidings of great joy; and the title of Noels, nowells, or novelles, applied to carols, would seem to bear out this idea. Carol singing is of great antiquity among Christian communities, as the carol by Aurelius Prudentius, of the 4th century, will show.

Carolan, kār-ō lān, **Turlogh**, Irish musical genus: b. near Nobber, County of Westmeath, about 1670; d. 1738. Having lost his sight when a child, he studied the harp, and in after life not only maintained himself thereby, but even became famous.

Carolanos, kā-rō-la'nōs, a heathen tribe of the Philippines, living in the mountain lands of the island of Negros, especially the Cordillera of Cayan. They are of Malayan stock and may be identical with the Buquitnon, though that cannot be determined. Practically nothing is known of them.

Caroli, Pietro Francesco, pē ā trō fran-chēs'kō kār-ō lē, Italian painter: b. Turin 1638; d. 1716. He studied painting at Venice, Florence, and Rome, and was professor in the Academy of Rome at his death. He is celebrated for his careful execution and beautiful coloring, and excelled particularly in perspective, of his skill of which he has left excellent specimens in his drawings of the interior of some of the Roman churches.

Carolina, kā-rō-lē'na. This name is generally given to a famous law of the German Empire, of the year 1532, under Charles V., which he himself called an ordinance of criminal procedure (*Peinliche Gerichtsordnung*). From him it was at a later period called *Constitutio criminalis Carolina*, or shortly *Carolina*. The arbitrary administration of justice, the disorder and cruelty which had become customary in the courts of Germany, where many a process was begun and ended with torture, and persons were sentenced even to death without regular process, gave occasion to this law. From the beginning of the peace of the land the necessity of such a law was felt throughout the country; but it was difficult in this, as in all other cases, to make the different members of the empire agree on one general measure. The Baron Johann von Schwarzenberg was chiefly instrumental in introducing this ordinance. He became minister of state of the Prince-bishop of Bamberg, and succeeded in procuring an ordinance of criminal procedure for Bamberg to be

drawn up and published in 1507. The same was also adopted in 1510 by the margrave of Brandenburg and Franconia; and at last a law of criminal procedure for the empire at large was passed by the diet at Ratisbon, in 1532. The Carolina contains 219 articles, which regulate the standing and oaths of judges, the character of witnesses, the penalties of different crimes, and the circumstances in which torture at that time common in criminal jurisprudence should be applied. Several German princes, as the elector of Saxony, the elector of Brandenburg, and of the palatinate, protested against it, in order to protect the laws of their states and their own privileges against the legislative power of the emperor; but at last the Carolina was established in almost every part of the empire. From the connection of Switzerland with Germany, and the fact that several Swiss towns were imperial cities, German laws frequently passed into Switzerland, and the Carolina became the law by which even the Swiss troops in the service of the kings of France were governed until the French Revolution.

Caroli'na Allspice. See CALYCANTHUS.

Carolina, Original Constitution of. For many years after the subversion of the old English order by political and religious insubordination, 1642-60, the dominant idea of the conservatives was to prevent its recurrence, as with the conservatives after the French Revolution; and their chief dread was of republicans and dissenters. It is an almost grotesque incident of this reaction, that by far its narrowest embodiment came from a liberal philosopher and an unbelieving incendiary politician,—John Locke and Lord Shaftesbury (Anthony Ashley Cooper). A group of eight noblemen, headed by the famous Lord Clarendon, and including Shaftesbury, were granted on 24 March 1663, a tract called the province of Carolina, after Charles II.; as extended 30 June 1665, it included the present North and South Carolina and Georgia, and in theory stretched west to the Pacific. "To avoid erecting a numerous democracy," in their own words, they had Locke, who was Shaftesbury's secretary, draw up (whether on his own lines or Shaftesbury's is a moot point) a form of government called the "Fundamental Constitutions," which is a classic for impractical absurdity even among Utopias. The mass of the people (not alone, he it remembered, the future immigrants, but a considerable population already living there in pure democracy) were to be hereditary "leet-men," or serfs of the soil. Next above them was a sort of upper middle-class commons called "lords of the manor," who could let out 10-acre tenant farms. Over both (as the charter gave the proprietors the right to create titles of nobility other than English ones) were a fantastic self-perpetuating colonial *noblesse*, of "landgraves" and "caciques." Crowning the whole were the proprietors; the eldest was "palatine" or viceroy, the others were admiral, chamberlain, high constable, chief justice, chancellor, high steward, and treasurer. The "leet-men" held three fifths of the land; the nobility and "lords of the manor" one fifth, not to be alienated after 1700; the proprietors the remaining fifth. The province was divided checkerboard fashion into squares, first of counties; then each county into eight "signeries" for the proprietors, eight

CAROLINA-PINK — CAROLINE

"baronies" for the nobility (each signory and barony to contain 12,000 acres, perpetually annexed to the title), and four "precincts," and each precinct into four "colonies" for the serfs. There was a Parliament; but the commons were carefully kept powerless by giving them only 14 members out of 50, making only freeholders of 500 acres eligible to seats, and electing them for life; with the further proviso that landgraves could sit in either house at will, and vote on the same measures in both. All initiative was in a supreme executive council, which prepared and submitted all legislation to Parliament; and the proprietors had a veto on all. Each proprietor had a superior court at which he presided in person or by proxy; each nobleman held a court-leet for his barony, and there were precinct courts. The laws were worthy of this closet constitution. The English Church was established and supported by public taxation, in a province inhabited largely by Quakers, and the rest by Scotch Presbyterians, Huguenots, Lutherans, etc. No one could live or hold property in or be a freeman of the province who did not acknowledge God, and that he is to be publicly worshipped. Every person above 17 not a member of some church, or who did not subscribe the "Fundamental Constitutions" and promise in writing to defend and maintain them, should be an outlaw. There was a severe censorship of the press, of ceremonies, of fashions, and of sports, in the hands of the nobility. Paid lawyers were prohibited; thus compelling the commons to put themselves under a relation of "clientage," in Roman fashion, to the nobility to avoid ruin. All commentaries on the constitution or laws were forbidden. This constitution was to replace one under which the people were ruled by a council of 12, chosen half by the proprietors and half by the Assembly; that Assembly consisting of 12 elected freeholders, so that the people had 18 out of 25 votes; with entire freedom of religion, civil marriage, security for five years from suit on cause arising outside of the country (for protection of emigrant debtors), exemption from taxation for the first year, and no political or social superiors anywhere. That is, free Englishmen in virtual democracy were to become at a blow the serfs and villeins of the time of the Norman Conquest. The proprietors bound themselves by solemn compact to maintain this incredibly foolish instrument as unalterable forever, and evidently expected men to emigrate to a savage wilderness on such terms. Five successive forms of this constitution were promulgated before its entire abandonment in 1693, each in turn proclaimed permanent and unalterable; and the result, especially in Albemarle County (afterward North Carolina), was simple anarchy. The people set them utterly at naught; and while the former system had been legally abolished, it continued in force by suffrage. Resistance to law as a first principle of life became ingrained in them; and the character of the colony was long and deeply injured by the quarter-century of attempt to force its people, new and old, into this iron mold of extreme feudalism. For further history, see NORTH CAROLINA; SOUTH CAROLINA.

Carolina-pink, Maryland *Pinkroot*, or *Worm-grass*, names given to the *Spigelia marilandica*, a plant of the order *Loganiaceae*, bearing scarlet flowers, and having a root used as a vermifuge. It occurs in rich woods, and ex-

tends from New Jersey, west, north, and south, to Wisconsin and Texas.

Carolina Ridge, in geology, the name given to an elevation of the bottom of the Atlantic Ocean off North Carolina, that occurred in Miocene time. It deflected the Gulf Stream and caused a great change in climate along the Atlantic coast. See *MIocene*; *TERTIARY*.

Caroline Amelia Elizabeth, Queen of England, wife of George IV., king of Great Britain and Hanover, second daughter of Duke Charles William Ferdinand of Brunswick: b. 17 May 1768; d. London, 6 Aug. 1821. She was married to the Prince of Wales, afterward George IV., in 1795. After the birth of her daughter, Charlotte Augusta (7 Jan. 1796), her husband abandoned her, declaring that no one could force his inclinations. This was the beginning of the disgraceful dispute between the two parties, which lasted till the death of Caroline, and exposed her honor to repeated accusations from her husband. The Princess of Wales lived retired from the court, at a country-seat at Blackheath, till 1808. In 1813 the contest was renewed between the two parties, the Princess of Wales complaining, as a mother, of the difficulties opposed to her seeing her daughter. In 1814 the princess obtained permission to go to Brunswick, and afterward to make the tour of Italy and Greece, in which the Italian Bergami was her confidant and attendant. Many infamous reports were afterward circulated, relating to the connection between the Princess and Bergami. When the Prince of Wales ascended the throne, 29 Jan. 1820, he offered her an income of £50,000 sterling, on condition that she should renounce the title of Queen of England, and every title appertaining to that dignity, and should not again return to England. She refused the proposal, returned to England, 5 June, and the next day entered London amid public demonstrations of welcome. She was now tried for adultery, but not convicted, and in this trial Brougham acted as the queen's attorney-general. Though banished from the court, the queen still lived at Brandenburg House, maintaining a style suitable to her rank. She was refused admission to Westminster Abbey on the occasion of the coronation of her husband, on 19 July 1821, and published a protest in the newspapers. Her tomb at Brunswick has a very short inscription, in which she is called the unhappy queen of England.

Caroline Matilda, Queen of Denmark, daughter of Frederick Louis, Prince of Wales: b. 1751; d. Celle, Hanover, 10 May 1775. She was married in 1766 to King Christian VII. of Denmark. She became the object of court intrigues caused by the jealousy of the grandmother and stepmother of her husband. These led to the execution for treason of Counts Struensee and Brandt, who were of the queen's party, and to the imprisonment of the queen herself, who was liberated through the interference of her brother, George III. of England. Her last hours are described in a small work, *Die letzten Stunden der Königin von Danemark*.

Caroline, *The*, an American steamboat used in 1837 by the American sympathizers with the Canadian insurgents under William Lyon Mackenzie (q.v.). The latter, after years of agitation, had gathered a band of insurgents in December, and attempted to seize Toronto,

capture the lieutenant-governor and his cabinet, and proclaim a republic. He was defeated, and fled to Navy Island on the British side of the Niagara River. Some hundreds of American sympathizers joined him, and he set up a "provisional government," issued paper money, and offered bounties for volunteers and a reward for the apprehension of the lieutenant-governor. On 29 December an American steamer, the *Caroline*, crossed over to his camp from Schlosser on the American side, laden with reinforcements, provisions, and munitions; and returning, lay at Schlosser that night full of men presumably ready for a similar trip the next day. The Canadians, incensed at this outrageous violation of neutrality, sent over an armed party in boats to enforce it. They boarded the *Caroline*, hustled the passengers and crew ashore, killing one man (Amos Durfee) on shore in the fray, towed the vessel out into the stream, set it on fire, and sent it over Niagara. A great uproar ensued. President Van Buren issued a proclamation ordering the neutrality laws to be respected, and, calling out the militia under Winfield Scott, he then demanded reparation from the British government. The latter naturally showed no great alacrity in responding. Shortly afterward, one Alexander McLeod came over to the American side, boasting that he was one of the boarding party and had killed one of the *Caroline's* men with his own hand. He was arrested, indicted by the grand jury for the murder of Durfee, and imprisoned to await his trial. Fox, the English minister, demanded his release; the secretary of state (Forsyth of Georgia) replied that he was in the hands of justice in New York State, and must await its course; Lord Palmerston thereupon assumed for the English government full responsibility for the assault on the *Caroline*, and again demanded his release. But Fox in his letter curiously added that the government had every reason to believe that McLeod was not one of the boarding party; in which case, of course, he was either a mendacious braggart or a common murderer, and the matter of the *Caroline* was irrelevant. Webster, now secretary of state, replied, ignoring this point, that if the case were in a Federal court the President would order a *nolle prosequi* entered; but it being in a State court, he could only await its action, and if it did not discharge McLeod, the case should go up to the United States supreme court. In the July term of 1838 a writ of *habeas corpus* was sued for in the New York supreme court, but refused. McLeod was acquitted, however, and the whole affair dropped.

Caroline Books, or **Libri Carolini**, a theological work in four books, prepared under the direction of Charlemagne (Carolus Magnus), in connection with the disputed question of image worship that seriously agitated the Church during the reign of that monarch. The second synod of Nicæa had given its approval to the use of images, agreeing in this point with the views of the Eastern Church. Owing to a misunderstanding of the Nicæan canons through a bad translation, which seemed to make the Eastern synod declare that the worship due to God alone, *latría*, should be paid to images, the 'Libri Carolini' severely reviewed the doctrine. The condemnation of image worship as formulated in the Caroline Books does not, however,

bear upon the inferior honor, *dulia*, paid to the saints and their images, or that given to the Virgin, *hyperdulia*.

Caroline Islands, a large archipelago in the North Pacific Ocean, between lat. 3° and 12° N., and lon. 132° and 163° 6' E., and between the Philippines and the Marshall isles. Area, about 560 square miles. It contains many groups, embracing in all about 500 islands and islets. Many of them are mere coral reefs, little elevated above the ocean. The most westerly group is the Palaoas, or Pelew Islands, which contain seven large and many small ones, all of coralline formation. The next group, Yap or Gouap, lies northeast of the last. In its chief island, which is mountainous, precious metals have been found. The other principal groups are Lutke, Mortlock, Siniavin, Enderby, and Hogoleu. The most easterly island is Ula-lan. The most important vegetable productions are palms, bread-fruit trees, and bananas. The inhabitants, numbering about 35,000, though mainly Micronesians, include various races, and have made very different degrees of progress in civilization. In the central groups they are of a handsome physical type, active and industrious, and have some commerce. On the east generally, and on the west, with the exception of the Pelew Islands, the inhabitants, though apparently of the same stock, are far less advanced. The islands were discovered in 1527 by the Portuguese, who gave them the name of Sequeira. In 1686 they were annexed and renamed in honor of Charles II. by the Spaniards, who soon changed the name to New Philippines. After several futile missionary attempts in the 18th century, Spain took little active interest in the group until August 1885, when the German flag was raised over Yap. A serious dispute followed this act, and the question being submitted to the Pope as arbitrator, he decided in favor of Spain, reserving special trade privileges to Germany. In 1887 disturbances broke out at Ponapé, in which the governor, who had arrested one of the American Protestant missionaries, was killed by the natives; but the rising was soon suppressed. In February 1899 Germany purchased from Spain for about \$3,300,000 the *Caroline* and Pelew islands, and all of the Ladrões, but Guam, which had been ceded to the United States in the treaty of peace that ended the Spanish-American war.

Carolingians. See CARLOVINGIANS.

Carolus-Duran, Auguste Émile, ā-mēl kārō-lūs-dū-rān, French portrait painter: b. Lille, 4 July 1837. His name was originally Charles Auguste Émile Durand. He was a pupil of Suchon, and received the medal of honor at the Salon of 1819. Ten years later he was created commander of the Legion of Honor. He is a brilliant colorist, and as a painter of women has long been a favorite. Many American artists have studied under him in Paris. Among characteristic works of his are 'La Prière du Soir' (1863); 'The Lady with the Glove'; and portraits of Émile Girardin; Queen Maria Pia, of Portugal; Countess of Warwick; and Duchess of Marlborough.

Carolus, a gold coin struck in the reign of Charles I., and originally 20 shillings in value, afterward 23 shillings. The name was given also to various other coins.

CARORA — CARPACCIO

Carora, *kā-rō'rā*, Venezuela, a city of the state of Lara, situated 95 miles south of Coro on a tributary of the Tocuyo River. It was founded by the Spaniards in 1572. It has a considerable trade in gums, rubber, and cochineal, and the raising of cattle mules is one of the chief industries. Pop. 8,000.

Carotid Artery, either of the two great arteries which convey the blood from the aorta to the head and the brain. In the article on the aorta (q.v.) the origin of the carotid arteries is described,—that from the right side springing from the innominate artery to supply most of the right side of the head; that on the left side arising directly from the aorta to supply all of the structures of the left side of the head. Apart from these slight variations in their origin on the two sides, the carotid arteries and their branches are practically duplicated in the two halves of the head. Thus the main branches, the common carotids, soon branch into two, the external and internal carotids. This division takes place about at the level of the thyroid cartilage. The external carotid supplies the upper part of the front and side of the neck, the tongue, larynx, pharynx, face, the pterygoid regions, the upper part of the back of the neck, the scalp, and the major portions of the brain membranes. The internal carotid soon enters the skull and supplies the greater part of the brain tissue, the orbital structures (the eye, etc.), and portions of the brain membranes. The branches of homologous arteries of the two sides anastomose somewhat, although many of the arteries of the brain are terminal arteries and do not anastomose. Occlusion of one of these vessels in the brain usually results in permanent injury. In deep cuts of the throat these arteries may be involved, but they lie very deep as a rule and are not often severed. (Morris, 'Anatomy'; Gray, 'Anatomy'.)

Car'otin (Lat. *carota*, "a carrot"), the coloring-matter of the carrot. Its formula is doubtful, for although carotin appears, from such analyses as have been made, to be a simple hydrocarbon, no other strongly colored hydrocarbon is known, and hence the probability is that oxygen is also an essential constituent. It may be extracted from the chopped carrot by the action of carbon disulphide, in which (as also in benzene) it is very soluble. It crystallizes in small, red plates, which are insoluble in water and in alcohol. A similar compound, called "hydrocarotin," is also known.

Carotto (*kā-rō'tō*) **Family**. 1. GIAN FRANCESCO, *jān frān-chēs'kō*, Italian painter: b. Verona, 1470; d. there, 1546. He studied under Liberale at Verona and under Andrea Montegna at Mantua. His earlier productions are in imitation of the style of Montegna; but at a later period the study of the works of Leonardo da Vinci and Raphael produced a decided change. Carotto is not distinguished by the grandeur of his conceptions, but excels in character and expression, and in the softness and the warmth of coloring. Verona contains most of his works. Among these is the 'History of Tobias,' a series of pictures in the church of Saint Eufemia. 2. GIOVANNI, *jō-vān'nē*, Italian painter: d. 1555. He was the brother of Gian, and his pupil. He was chiefly an architectural painter and is celebrated

for his copies of ancient ruins. He is also said to have given instruction to Paul Veronese.

Carouge, Switzerland, a town of the canton of Geneva, on the left bank of the Arve, opposite Geneva, with which it is connected by a bridge. It has machine-works, foundries, dye-works, and manufactures of watches. It was ceded to Switzerland in 1816, until which time it had been the capital of the Sardinian province of Carouge, which was suppressed in 1837. Pop. (1902) 7,500.

Carp, a name applied to many fishes belonging to the *Cyprinidae*. The members of this family inhabit fresh waters, and are extremely numerous in genera, species, and individuals. It is estimated that there are more than 1,000 species. One group of the family, found in North America, includes fishes known as suckers, buffalo-fishes, redhorses, and mullets, while another group contains the minnows, dace, fat-heads, chubs, etc. They are all soft-finned fishes, with a stout, serrated spine, which stands in front of both the dorsal and the anal fins. There are no teeth in the mouth, but they are developed in the pharyngeal bones; that is, in the throat. The flesh is not of the best quality, and is full of fine bones. The name carp is especially applied to one fish—*Cyprinus carpio*. This was introduced into North America from Europe by the United States Fish Commission, but it came originally from Asia. It inhabits our streams and lakes, where it is increasing rapidly in numbers. It reaches a length of two feet and may attain a weight of 40 pounds. It is a scaly, compressed, robust fish, with well-developed barbels and dorsal fin, and a short anal, and is of a brownish hue. Owing to its hardness, its durability under extreme temperatures, the facility with which it may be raised because of its adaptability to sluggish ponds and swampy lakes, it might form an important element in the fish food-supply of the North American interior, since farmers can raise it easily in their mill-ponds. It feeds upon vegetable fare, larvæ, insects, etc., and during the winter months hibernates, at which time it requires no food. The eggs, also, are very hardy, and number several hundred thousands to each individual. They adhere to aquatic grasses and weeds.

The carp is usually covered with large scales; but one variety of it, the "mirror carp," has only a few large scattered scales; while another species, the "leather carp," is wholly without scales. (Consult the publications of the United States Fish Commission.)

Carp-sucker, a common and little-valued fresh-water fish of the genus *Carpiodes*, related to the buffalo-fishes and suckers. It is found throughout the central part of the United States, takes its name from its carp-like form, averages about two feet in length, and is a dull green above, grading into silver beneath.

Carpaccio, **Vittore**, *vē tō rā kār-pā'chō*, Italian artist: b. Istria, about 1450; d. 1525. He was one of the most celebrated masters of the old Venetian school, and was the rival of Bellini and the last Vivarino. All that is known of his life is that he belonged to Venice, of which he has reproduced in the back-ground of his pictures the streets and monuments. His distinguishing characteristics are natural expression, vivid conception, correct arrangement,

CARPANI — CARPENTARIA

and great variety of figures and costumes. He also excelled as an architectural and landscape painter. His favorite employment was the dramatic representation of sacred subjects, several of which he has illustrated by a series of paintings. Of these the most celebrated are the histories of St. Ursula and St. Stephen. The former, consisting of nine pictures, is now in the Academy at Venice, and has been engraved; the latter, in five pictures, is in Paris, Milan, and Berlin. The 'Madonna and Child Enthroned,' supposed to be an earlier production, is in the National Gallery, London. **BENEDETTO, CARPACCIO**, a son or grandson of the above, flourished about the middle of the 16th century, and is known for a fine painting of the 'Coronation of the Virgin' in the church of Capo d'Istria.

Carpani, Giuseppe, joo sěp'pě kar-pa'ně, Italian dramatist and writer on music: b. Villaliese, near Milan, 28 Jan. 1752; d. Vienna, 22 Jan. 1825. Having prepared for the profession of the law, he afterward devoted himself to literary pursuits, and produced a great number of plays and operas partly translations and partly original. In 1792 he was editor of the 'Gazzetta di Milano,' and wrote violent articles against the French Revolution. He was obliged to leave the city after the invasion of the French, and went to Vienna, where he was appointed censor and director of the theatre. In 1809 he accompanied the Archduke John in the expedition against Napoleon. Under the title of 'Haydine,' he published a series of curious and interesting letters on the life and works of his friend Haydn, the composer. These letters, published in a French translation as an original work by L. A. C. Bombet, or, as other biographers state, by Beyle (known under the *nom de plume* of Stendhal), gave rise to a great literary controversy, in which Carpani vindicated his authorship most successfully.

Carpa'thian Mountains, a range of mountains in central Europe, forming for the greater part of their extent a natural boundary of Hungary, in the shape of a semicircular belt of nearly 800 miles in length, extending from Orsova on the Servian frontier, to Presburg. Its breadth is considerable, reaching a maximum of 240 to 250 miles, between the Banat and Transylvania. The Carpathian chain may be divided into two great sections, the East and the West Carpathians, the former curving from the mouth of the Nera to the source of the Theiss, and forming the boundary between Austria and Rumania; the latter proceeding from the sources of the Theiss and the Pruth, and terminating on the banks of the Danube west of Presburg, and forming the boundary between Hungary and Galicia. To the western Carpathians belongs the remarkable group of the Tatra, in which is situated the culminating summit of the whole system, the Gerlsdorf Peak, 8,737 feet. Several other peaks exceed 8,000 feet. The loftiest summit of the eastern Carpathians reaches an elevation of 8,318 feet. The most remarkable and frequented passes are those of Teregoval, leading from Orsova to Temeswar; of Vulkar, forming the valley in which the Schyl flows; and of the Rothenthurm, in a gorge formed by the Aluta at the foot of Mount Szurul. The outer bend of the Carpathians is much steeper than that which descends toward the valleys of Transylvania and Hungary. The

only important rivers which actually rise in the chain are the Vistula, the Dniester, and the Theiss. The formation of the Carpathians took place mostly in the Tertiary period, and was practically completed at the end of the Miocene. The eastern part of the Carpathian chain, from Orsova to the source of the Burcza, near Kronstadt, is entirely composed of primitive rocks. These are succeeded by grauwacke, which extends to the sources of the Theiss, and is only interrupted by a primitive group between the pass of Borgo and the source of the Viso. A great chain of trachyte appears on the frontiers of the Bukowina, and stretches to the point where the Aluta begins to flow southwest. To the west of this chain, on approaching the plains, an extensive tract of sandstone belonging to the coal formation begins to appear, and covers the greater part of Transylvania. Tertiary formations surround the vast plains of Hungary, which consist of a rich alluvium, and must once have been the bed of a lake. Basalt frequently occurs, but no distinct traces of extinct volcanoes have been found. The Carpathian range is rich in minerals, including gold, silver, quicksilver, copper, and iron. Salt occurs in beds, which have sometimes a thickness of 600 or 700 feet, and are apparently inexhaustible. On the plateaus corn and fruit are grown to the height of 1,500 feet; higher up the mountain steeps are covered with forests of pine, some of them as high as 5,500 feet. About 6,000 feet seems to be the vegetable limit. Above it a few lichens may be found, but in general nothing is seen but bare, steep rocks, many of them in the form of conical peaks.

Carpathos, kār'pa thōs, an island in the Ægean Sea, now called Skarpanto. It is now under Turkish rule; in ancient times it belonged to Rhodes.

Carpeaux, Jean Baptiste, zhōn bap'těst kar-pō, French sculptor: b. Valenciennes, France, 14 May 1827; d. Courbevoie, near Paris, 12 Oct. 1875. He studied at the School of Architecture in Valenciennes, and later went to Paris, becoming a pupil of Rude and of Duret. In 1854 he obtained the Prix de Rome. His bronze 'Neapolitan Boy' attracted notice; and 'Ugolino and His Four Sons' (1863), also in bronze, though it defied the canons of sculpture, made him famous. He settled in Paris in 1862. His masterpiece, a marble group, 'The Dance,' in the façade of the New Opera in Paris, fully showed his dramatic power and the exuberance of his imagination; but it provoked much hostile criticism as involving an attempt to stretch beyond their natural province the limits of the plastic art. The most notable of his later works is the great fountain in the Luxembourg Gardens.

Car'pel, the leaf forming the pistil. Several carpels may enter into the composition of one pistil.

Carpenta'ria, Gulf of, a large gulf indenting the northern coast of Australia, named for its discoverer, Pieter Carpenter. Cape York Peninsula, the northern extremity of Queensland, is on the east, and Arnhem Land on the west. It contains a number of islands, among them Groote Eylandt, Sir Edward Pellew Islands, and Wellesley Islands. Its maximum width is about 400 miles, and its length 460 miles. The land around is generally low.

CARPENTER

Carpenter, Charles Carroll, American naval officer: b. Greenfield, Mass., 27 Feb. 1834; d. 1 April 1899. He was promoted commodore 15 May 1893, and rear-admiral 11 Nov. 1894; was commander-in-chief of the United States Asiatic squadron from 27 Aug. 1894, till 9 Nov. 1895; and was retired on reaching the age-limit, 28 Feb. 1896. During the summer of 1895 he rendered invaluable service in China in protecting American missionaries and in co-operating with United States Minister Charles Denby and the British and Chinese authorities to preserve peace, particularly after the Kucheng massacre.

Carpenter, Edmund Janes, American journalist: b. North Attleboro, Mass., 16 Oct. 1845. He was for many years on the editorial staffs of Providence, New Haven and Boston papers, and has published 'A Woman of Shawmut: a Romance of Massachusetts Bay Colony, 1640' (1892); 'America in Hawaii' (1898).

Carpenter, Edward, English socialistic writer: b. Brighton, England, 20 Aug. 1844. He was educated at Trinity Hall, Cambridge, and was for some time Fellow and lecturer there, as well as curate under the noted F. D. Maurice. In 1874 he gave up his fellowship and left the ministry, and until 1881 lectured on science and music in university extension work. He has since devoted his time to literary work, market gardening, and socialist propaganda. In 1884 he visited the United States in order to meet Walt Whitman. He has published 'Towards Democracy'; 'Love's Coming of Age'; 'Angels' Wings'; 'Adam's Peak to Elephanta'; 'Iolaus: an Anthology of Friendship.'

Carpenter, Esther Bernon, American prose-writer: b. Wakefield, R. I., 1848; d. 1883. She contributed to magazines; published 'The Huguenot Influence in Rhode Island'; and 'South Country Neighbors' (1887).

Carpenter, Francis Bicknell, American painter: b. Homer, N. Y., 6 Aug. 1830; d. 1883. He studied with Sanford Thayer at Syracuse, N. Y. (1844), and in 1852 became an associate of the National Academy. Among his works are a portrait of President Fillmore, in the City Hall, New York; a portrait of President Lincoln, in the capitol at Albany, N. Y.; and the 'Emancipation Proclamation' (1864), in the capitol at Washington. While executing the last-named painting he was closely associated with President Lincoln, and his observations during this period are embodied in his book entitled 'Six Months in the White House with Abraham Lincoln.'

Carpenter, Frank George, American journalist: b. Mansfield, Ohio, 8 May 1855. He has been connected with various newspapers, and has made several important newspaper tours. He has published a series of geographical readers: 'Through Asia with the Children' (1898); 'Through North America with the Children' (1891); 'South America: Social, Industrial and Political' (1900).

Carpenter, George Rice, American literary critic: b. off the coast of Labrador, 25 Oct. 1863. He was graduated from Harvard University in 1886, and subsequently studied in Paris and Berlin. He was instructor at Harvard, 1888-90, professor of English in the Massachusetts Institute of Technology, 1890-3, and pro-

fessor of rhetoric at Columbia University from 1893. He has written a 'Life of John Greenleaf Whittier' (1902); 'Elements of Rhetoric and Composition'; 'Life of H. W. Longfellow'; 'Principles of English Grammar.'

Carpenter, Gilbert Saltonstall, American military officer: b. Medina, Ohio, 17 April 1836. He was graduated at Western Reserve College in 1859; was admitted to the bar in 1861, and immediately afterward entered the Union army with the 19th Ohio Volunteer Infantry. Soon afterward he was transferred to the 18th United States Infantry, with which he served through the Civil War, in which he received the brevet of captain for gallantry in the battle of Stone River. Subsequently he rendered service in various Indian campaigns; was commissioned a brigadier-general of volunteers in the war with Spain in 1898; and became colonel of the 18th United States Infantry, 20 June 1899. His volunteer appointment was made in recognition of his gallantry at El Caney, Cuba. He retired in January 1900.

Carpenter, Henry Bernard, Irish Unitarian clergyman: b. Dublin, Ireland, 22 April 1840; d. Sorrento, Maine, 17 July 1890. He was a brother of William Boyd Carpenter (q.v.), bishop of Ripon, and was educated at Oxford University. He was for a time chaplain to the Earl of Belmore. He subsequently became a Unitarian, and coming to the United States in 1874 was pastor of the Hollis Street Church in Boston, 1878-87. He published 'Liber Amoris,' a volume of verse, and after his death a collection of his poems was edited by J. J. Roche (q.v.). He was a brilliant speaker and very popular as such.

Carpenter, Joseph Estlin, English Unitarian scholar: b. Ripley, Sussex, 5 Oct. 1844. He was educated at University College, London, and Manchester New College (now at Oxford). He was minister of Oakfield Road Church, Clifton, 1866-9, and of Mill Hill Chapel, Leeds, 1869-75, and is now vice-principal of Manchester New College, and Case lecturer on comparative religion there. He is one of the very foremost living authorities as a Sanskrit scholar and biblical critic, and besides editing Ewald's 'History of Israel' (Vols. III-V), and translating Tiele's 'Outlines of the History of Religion,' is the author of 'Life and Work of Mary Carpenter' (1879); 'Life in Palestine'; and 'The First Three Gospels: Their Origin and Relations' (1890). With Rhys Davids he has edited the 'Sumaigala Vilasini' (1886); and the 'Digha Nikaya' (1889). With Harford-Battersby he has also edited the Hexateuch according to the revised version.

Carpenter, Lant, English Unitarian clergyman: b. Kidderminster, 2 Sept. 1780; d. at sea, 5 April 1840. Designed for the ministry, he was sent in 1797 to the Northampton Academy. That school being temporarily discontinued, young Carpenter was placed at Glasgow College, where, however, he did not continue the length of time necessary to take his degree. Leaving college in 1801, he spent some time in teaching, and as librarian of the Athenæum, Liverpool. At Liverpool, Carpenter's views were so clearly in sympathy with those of the Unitarian denomination generally, that he received several invitations to the pastoral charge of Unitarian congregations, and a call to a professorship in

CARPENTER

their college at York. In 1805 he accepted a call to Exeter, where he continued for 12 years. In 1806, the University of Glasgow gave him the degree of LL.D., although he had applied only for the degree of M.A. From Exeter he removed to the pastoral charge of the Unitarian congregation at Bristol (1817), where he continued until his death, which occurred by falling from a vessel between Naples and Leghorn, while on a tour for his health. Dr. Carpenter's piety was of an eminently practical turn. The instruction of children was an object of constant interest. Amid all his pastoral and literary labors he always found time and energies to devote to juvenile instruction, and, even against the prejudices of his congregations, established Sunday-schools among the children of Exeter and Bristol. In his pastoral charges at Exeter and Bristol, he was active in co-operation with others in the establishment of libraries, schools, savings banks, and institutions for general improvement and welfare. His published works are mainly theological and doctrinal, in support of the Unitarian sentiments he had early espoused. Among his more important works are 'An Introduction to the Geography of the New Testament'; 'Unitarianism the Doctrine of the Gospel'; 'Examination of the Charges Against Unitarianism'; 'Harmony of the Gospels'; and a volume of sermons. Mild in controversy, faithful in humane labors, and practically devoted to the improvement of society, Dr. Carpenter was greatly respected even by those who were his most staunch antagonists in theology.

Carpenter, Louis George, American engineer: b. Orion, Mich., 28 March 1861. He was graduated at Michigan Agricultural College in 1869, and after serving there as instructor in mathematics and engineering took post-graduate courses at the University of Michigan and Johns Hopkins University. In 1888 he became professor of engineering at the Colorado Agricultural College and meteorologist and irrigation engineer at the Agricultural Experiment Station, and organized the first course in irrigation engineering given in any American college. He founded the American Society of Irrigation Engineers in 1891. He has published Government Reports, 'Artesian Wells in Colorado' (1890); 'Irrigation Progress in Colorado' (1891).

Carpenter, Louis H., American military officer: b. Glassboro, N. J., 11 Feb. 1839. He entered the 6th United States Cavalry, and served in the Army of the Potomac through numerous engagements. He was an aide-de-camp to Gen. Sheridan; was commissioned colonel of volunteers in 1865, subsequently served in various Indian campaigns, became colonel of the 5th United States Cavalry in 1897, brigadier-general of volunteers in 1898, and brigadier-general, U. S. A., 18 Oct. 1899, for services in the Spanish-American war, and particularly as commander of the Department of Porto Principe, Cuba. He was retired 19 Oct. 1899.

Carpenter, Mary, English philanthropist: b. Exeter, 3 April 1807; d. Bristol, 15 June 1877. She was the eldest daughter of Lant Carpenter (q.v.). Her special work was for the neglected children of the poor and young criminals. She established a number of schools and reforma-

tories, including the Red Lodge, a girls' school at Bristol, of which she was superintendent. She visited India in 1866, 1868, 1869, and 1875; and came to the United States and Canada in 1873, where she spoke on prison reform. She wrote 'Reformatory Schools for the Children of the Perishing and Dangerous Classes' (1851); 'Juvenile Delinquents' (1853); 'Our Convicts' (1864); and 'Six Months in India.' See J. E. Carpenter, 'Life of Mary Carpenter' (1879).

Carpenter, Matthew Hale, American legislator: b. Moretown, Vt., 22 Dec. 1824; d. Washington, D. C., 24 Feb. 1881. He studied at West Point, 1843-4; was admitted to the bar in 1845, and afterward studied under Rufus Choate. He removed in 1848 to Wisconsin, where he acquired a great reputation as a lawyer and orator. He was sent to the United States Senate from Wisconsin in 1869 and in 1879.

Carpenter, Rolla Clinton, American engineer: b. Orion, Mich., 26 June 1852. He was educated at the Michigan Agricultural College, the University of Michigan, and Cornell University; was professor in the Michigan Agricultural College, 1878-90, and later became professor of experimental engineering in Cornell. He has written 'Experimental Engineering'; 'Heating and Ventilation'; and numerous papers on engineering topics.

Carpenter, Stephen Cutter, American journalist: b. England; d. about 1820. He came to the United States in 1803, and settled in Charleston, S. C., where he founded and published with John Bristed the 'Monthly Register Magazine and Review of the United States.' Later he was editor of the 'Mirror of Taste and Dramatic Censor,' in which appeared some clever sketches of American actors. His works include: 'Memoirs of Jefferson, Containing a Concise History of the United States from the Acknowledgment of Their Independence, with a View of the Rise and Progress of French Influence and French Principles in that Country' (1809); 'Select American Speeches, Forensic and Parliamentary, with Prefatory Remarks, a Sequel to Dr. Chapman's Select Speeches' (1815); and under the pen-name of "DONALD CAMPBELL," 'Overland Journey to India' (2d ed, 1809-10), and 'Letter on the Present Times'.

Carpenter, William Benjamin, English physiologist and naturalist: b. Exeter, 29 Oct. 1813; d. 19 Nov. 1885. He was the eldest son of Lant Carpenter (q.v.); was educated in his father's school at Bristol, and in 1833 entered University College, London, as a medical student. Two years later he went to Edinburgh University, where he graduated as M.D. in 1839; and in that year also he produced his first important work, 'The Principles of General and Comparative Physiology.' In 1844 he was elected a Fellow of the Royal Society and also obtained the Fullerian professorship of physiology at the Royal Institution. From 1847 till 1852 he was editor of the 'British and Foreign Medico-Chirurgical Review,' and in 1856 he was appointed registrar of the University of London, a post which he resigned in 1879. He wrote several well-known works on physiology, one of which has been already referred to. Others are: 'Principles of Mental Physiology' (4th ed. 1876); and 'Principles of Human

CARPENTER — CARPENTRY

Physiology' (1846, new edition by H. Power 1881). Still other works of his are: 'Introduction to the Study of the Foraminifera' (1862); 'The Microscope and Its Revelations' (1868, 6th ed. 1881); 'The Physiology of Temperance and Total Abstinence' (1853); besides many papers in scientific journals. He took a leading part in the expeditions sent out by government in 1868-70 for deep-sea exploration in the North Atlantic, and was chosen president of the British Association at Brighton in 1872.

Carpenter, William Henry, American philologist: b. Utica, N. Y., 15 July 1853. He received a university education in the United States and Europe, became instructor in rhetoric and lecturer on North European literature in Cornell University in 1883, instructor of German and Scandinavian languages in Columbia University, adjunct professor of Germanic languages and literature in the same institution in 1890, and subsequently professor of Germanic philology there. He has published several works in the line of his specialty.

Carpenter-bee, a species of bee (*Xylocopa virginica*) which burrows into dead tree-trunks, lumber, and even into woodwork of buildings. It is a large, black-bodied bee, as big as the biggest bumblebee. Its burrow is about half an inch in diameter, runs horizontally across the grain of the wood for a short distance, then forms a tunnel at right angles to this entrance, running sometimes 12 to 18 inches. When the tunnels are complete, the cells are made and supplied with pollen. The cells are about seven eighths of an inch long, and are separated from each other by partitions made of sawdust glued together. When the eggs, which are laid one in each cell, are hatched, the larvæ feed on the pollen-deposit until they are ready to bore their way out. The carpenter-bee will use the same burrow again and again, and its home is sometimes utilized by other species of bees.

Carpenters' Hall, Philadelphia, on the south side of Chestnut Street between Third and Fourth. It was built shortly after 1770 (as an assembly house and club) for the carpenters' guild of that city, and probably for civic uses if desired. In 1774 it became famous as the chosen meeting-place of several conventions for the liberation of the colonies. The first was on 15 July, when the committee of correspondence of the colony appointed a session of committees from each county, as "the most effective means toward a union." Later, on 5 September, the first Continental Congress met in its "plain but spacious rooms" on the lower floor, although the State house had been offered them. Behind its closed doors were prepared the papers which Chatham said ranked with the greatest of the world. The second Congress also began its sessions there, 10 May 1775.

Carpentras, kâr-pân-trâ, France, a town of the department of Vaucluse, situated 14 miles northeast of Avignon. In Roman times it was known as *Carpentoracte*, was a place of importance, and possessed many handsome edifices, of which a few traces are left. The principal structures are an aqueduct, which crossed the valley of the Auzon by 48 arches; a Roman triumphal arch, a Gothic cathedral, and the library. Carpentras has a considerable local trade, and weekly markets, which are among the

most important in southern France. It was formerly the seat of a bishopric, and Pope Clement V. had his residence there in 1313.

Carpentry, the art of combining pieces of timber to support a weight or sustain pressure. The work of the carpenter is intended to give stability to a structure; that of the joiner is applied to finishing and decoration. The scientific principles of carpentry are founded on the doctrines of the composition and resolution of mechanical forces, and a knowledge of these doctrines, either theoretical or practical, is indispensable to the skilled carpenter. To go into the principles of the art would be merely to explain a particular application of these mechanical forces, which would be beyond the scope and limits of this work. An explanation of the terms employed in carpentry may, however, be useful to the general reader. The term "frame" is applied to any assemblage of pieces of timber firmly connected together. The points of meeting of the pieces of timber in a frame are called "joints." "Lengthening" a beam is uniting pieces of timber into one length by joining their extremities. When neatness is not required this is done by "fishing." In this mode the ends of the beams are abutted together, and a piece of timber placed on each side and secured by bolts passed through the whole. Sometimes the parts are indented together, and pieces termed "keys" are notched into the beams and side pieces. When it is desirable to maintain the same depth and width throughout the beam "scarfing" is employed. This is cutting from each beam a part of the thickness of the timber, of the length of the intended joint, and on opposite sides, so that the pieces may be jointed together, and bolted or hooped. In bolting scarfs, side plates of iron are used to protect the wood. When greater strength is required than can be produced by a single beam, "building" and "trussing" beams are resorted to. Building beams is combining two or more beams in depth so as to have the effect of one. In trussing the beam is cut in two in the direction of its length, and supported with cross-beams, as in roofing. "Mortise" and "tenon" is a mode of jointing timber. An excavation called a mortise is made in one piece, and a projecting tongue to fit it, called a tenon, in the other. The tenon is confined in the mortise by a pin penetrating it laterally through the side of the mortised beam, or by an external strap of iron passing round the mortised beam and rivetted in the one terminating in the tenon. The timber frame-work of floors is called "naked flooring." It is of three kinds—single, double, and framed. Single flooring consists of a series of joists stretching across, the whole void from wall to wall, without an intermediate support. The flooring boards are laid on the top of these, and the ceiling of the lower story fixed to the under side. Double flooring consists in laying binding joists across the floor about six feet apart, crossed above by bridging joists, and also crossed below by the ceiling joists. Framed flooring is provided with girders or beams in addition to the binding, bridging, and ceiling joists. To prevent the transmission of sound, a double ceiling of lath and plaster is sometimes used, but generally pugging is inserted between the roof and the ceiling. "Cornice bracketing" consists in rough wooden pro-

CARPET—CARPET INDUSTRY IN AMERICA

files of the room cornices, which are afterward lathed round and plastered. Partitions, when not required to bear weight, are formed by laying along the floor a piece of timber called a "sill," together with a corresponding piece along the ceiling joists, the space within being filled with vertical pieces called "quarters," to which the lath is nailed. When the partition has weight to support, it has to be trussed with posts and braces. The timbers which support the steps of a wooden staircase are termed the "carriage." They consist of two pieces of timber inclined to the "rake," or projection of the steps, and termed "rough strings," which may rest upon a piece of timber projected horizontally from the upper wall, called a "pitching" or "apron" piece, which also supports the joists of the landing or "half pace." The "roof" is the framework by which the covering of a building is supported. It may consist of a series of pieces of timber with their one ends resting on the opposite walls, and their other ends meeting in a point, which are called "rafters." When loaded with the weight of the covering, this framework would be apt to thrust out the roof; a third piece is consequently added, which, like a string, connects the lower extremities of the rafters and prevents them from spreading. This is called a "tie," and the whole frame a "couple." When the tie is of such a length that it is apt to droop in the middle, or "sag," by its own weight, a fourth piece is added to unite it directly with the apex of the rafters; this is called the "king-post." If the rafters, too, are liable to sag, cross pieces called "struts" are introduced, uniting their centres with the centre of the tie. Instead of the king-posts and struts, the centre of each rafter may be joined to the tie by a piece falling perpendicularly on the latter, and to each other by a piece running across parallel to and above the tie, forming a parallelogram with the perpendiculars and the section of the tie enclosed by them. The suspending pieces are called "queen-posts," and the horizontal one a "collar-beam." The whole frame, constructed in either way, is called a truss. The trussed frames are placed at intervals of about 18 feet apart, and support horizontal pieces called "purlins," which run the whole length of the roof and support the common rafters with their covering.

The principal instruments used in carpentry are saws, as the circular-, band-, and tenon-saws; planes, as the jack-plane, smoothing-plane, molding-plane, etc.; chisels, gouges, brad-awls, gimlets, descriptions of which will be found in their places.

Carpet (Lat. *carpere*, to "pluck" or "card," as wool), a thick woolen fabric used for covering floors. The word originally meant (in old French) a coarse cloth in which packages were wrapped for packing upon the backs of men and animals. As man advanced in civilization and desire for comfort, he began to use his packing *carpite* as a wrap for himself and to cover his feet and limbs at night. From that he began to use it to protect his sandaled feet from cold stone floors. Then the material was made finer and gradually embellished with colors and designs. The art progressed most rapidly in the cold mountain districts of western Asia—Persia, Turkey, Syria.

The art of carpet-making in its best sense

still remains with the Orient. Some of the Indian carpets approach the fineness of those of Persia. Very high prices have often been obtained for some of these Oriental weaves.

Carpet Industry in America. A hundred years ago very few woolen carpets were in use in America. A few wealthy people had Turkish rugs, and some ingraines were imported; but they were so rare that children were cautioned to tread lightly on them when permitted on state occasions to enter the carpeted room. No carpets were made in America except "rag carpets"—the striped combination of rags and list which the housewives wove at home, and which are still made in small quantities both in farm-houses and in factories. The first carpet dealers in New York of whom we know anything were J. Alexander & Company, whose advertisement in Parker's *New York Gazette*; or *The Weekly Post-Boy*, on Monday, 30 June 1760, read as follows:

"J. Alexander & Company have removed their store to Mr. Haynes's house on Smith St., where Mr. Proctor, watch-maker, lately lived, where they sell Check Handkerchiefs, linens of different kinds, Lawn and Minonets, Scot's Carpets, broad and narrow cloths, Shoes of different kinds, made shirts, Hats, Stockings, with several other goods; Eine's Scot's barley and Herrings. Also a choice parcel of Old Madeira in Pipes."

In the following year they offered for sale Turkey carpets, and two years later state that they "have imported some English and Scot's carpets and Hair Cloth for Stairs and Passages." They were then located "in the house right opposite Mr. Donald Morison Ship Chandler House, betwix the Fly and Burling Slip." Judging from their advertisements in the papers of the day, they were not only the pioneers in the carpet business, but also the originators of the modern department store. From this time on the use of carpets began to increase and the business to grow, until, according to the city directories, there were lately over 300 firms engaged in the sale of carpets in New York and Brooklyn, the amount of capital invested being many millions. It was not until many years after carpets were first used in the colonies that the manufacture was introduced here, and the colonies had then become the United States. In 1791 William Sprague began to make Axminsters in Philadelphia. One of his first productions was a pattern which represented the coat-of-arms of the young republic. The carpet was probably not wonderful, but it has achieved fame, not so much on account of the fact that it was our first attempt, as because it was the first article to which the principle of tariff protection was applied. Alexander Hamilton was secretary of the treasury, and in a report on manufactures sent to the House of Representatives in 1791, he recommended that a duty of two and a half per cent be laid on carpets. To quote his own words: "To which the nature of the articles suggests no objection, and which may at the same time furnish a motive the more to the fabrication of them at home, toward which some beginnings have been made." (5 Dec. 1791.) The proceeds of this duty he proposed to use as a bounty to encourage the growth of wool in the United States.

CARPET INDUSTRY IN AMERICA

Early in the century the manufacture of ingrain carpets was begun, and has continued steadily increasing in amount ever since. Probably the first ingrain mill in the United States was that of George M. Conradt, who came to this country from the kingdom of Württemberg, and settled in Frederick County, Maryland. The factory was a stone building, and was still standing not many years ago. The carpets were made in a hand-loom on a drum having rows of pegs somewhat like the cylinder of a music-box. This drum worked the harness. Jacquard's great invention was made in 1800, and soon after began to be applied to the weaving of carpets in this country. Among the early mills was one owned by Henry Burdett, at Medway, Mass. Alexander Wright was the superintendent, and the concern is notable as having been the starting-point of what became later the great corporation known as the Lowell Manufacturing Company, whose carpets afterward were the standard goods of the country. In 1825 Wright endeavored to gain information touching the jealously guarded secrets of the Jacquard machine, then in use in the manufacture of ingrains in Philadelphia, which city seems to have been the second starting-point for the manufacture of ingrains. He was unable to gain access to the mills, and sailed for Scotland, whence he soon returned with the best looms he could procure. He also brought over with him William and Glaude Wilson, to aid in operating the machinery. Glaude Wilson was a skilled mechanic, and devised improvements in the Jacquard loom, simplifying its construction and rendering it more certain in operation. He resided many years in Lowell, and lived to see the Lowell Company become one of the most important manufacturing establishments in the country.

While the Medway experiment was going on, a charter had been granted to the Lowell Manufacturing Company, and on 22 Feb. 1828 its organization was completed. In those days directors' meetings were held at seven o'clock in the evening. Whitney, Cabot & Company were appointed to build the mills, employ the labor, and afterward sell the goods. The Medway mill and machinery were sold to the Lowell Company, which kept the looms in operation in that place until its own factory at Lowell was finished. Alexander Wright, referred to above, was the first superintendent. For a long time the enterprise was regarded as an experiment and many believed that the demand for carpets would not justify paying for the skill necessary to make them. The hand-loom of those days were by no means as perfect as the hand-loom of our time. The Lowell Company, however, persevered, and ingrain factories continued to spring up in various parts of the country. The progress was slow, and with the exception of the Hartford Carpet Company, then operating as two separate concerns, very few of the firms which afterward became famous started until many years later.

E. S. Higgins & Company began to manufacture ingrains in New York in 1841. Alexander Smith began at West Farms in 1844. Robert Beattie started in New York in 1840. John Bromley did not set up his looms in Philadelphia until 1845. Philadelphia has now some of the finest factories in existence, and its production is larger than that of all the rest of

the country combined. More yards of ingrain carpets are made there than in any other city in the world, and the goods range from the highest to the lowest grade. The imports from England and Scotland continued to be heavy in spite of distance and duties, as up to 1850 hand-loom only being in use, the product of these and the other mills using these looms was necessarily very limited, and we had to overcome the prejudice against domestic goods.

Meanwhile Alexander Smith and J. G. McNair had devoted much time and labor to the invention of a patent process for weaving tapestry ingrains. They succeeded in producing a carpet which filled a want of the times for a strong and durable fabric in which a large variety of color could be introduced. The Crossleys, of Halifax, England, purchased the rights to the invention, paying a royalty of a penny a yard for England. Templeton, of Ayr, paid £200 and a like royalty for Scotland. The goods become enormously popular, and Stephen Sanford, of Amsterdam, N. Y., also secured the right to manufacture them. The fame of the carpets spread so rapidly that it did much to stop the importation of foreign ingrains.

Erastus B. Bigelow (q.v.), a young medical student of Boston, who was but 20 years of age, had seen somewhere the manufacture of coach-lace by hand. He was without mechanical training; and, in fact, had never read a book on the subject; but in 40 days after he took up the idea he perfected a power-loom by which coach-lace weaving could be done. At a single stroke he so reduced the cost of weaving this class of goods that what had previously cost 22 cents a yard was reduced to three cents. This invention brought him into notice, and he set to work to devise a power-loom for ingrain-carpet weaving. Before the year was out he succeeded. At this time eight yards a day was the product of the ingrain hand-loom. Mr. Bigelow's loom at once increased the product to 10 and 12 yards, and, after some defects had been remedied, rolled it up to 25 yards a day, thus stimulating successive inventors of power-loom, such as Duckworth, Murkland, Crompton, and others, who have multiplied the result, so that the product now reaches to from 40 to 45 yards a day, although the hours of labor have been materially shortened.

But Mr. Bigelow did not rest here. In 1848 he set to work to invent a power-loom for the weaving of Brussels and tapestry carpets. At this time the product of a long and hard day's labor for a weaver, including a boy to draw the wires, was seven yards of Brussels carpet. At once Mr. Bigelow raised this to over 25, some modern machines now getting 55 yards of production in a day. Prior to the perfecting of this invention, he had, with his brother, Horatio N., organized the Bigelow Carpet Company, which has the honor of being the original power-loom manufacturer of Brussels and Wilton carpets. The company has been very successful, and now ranks among the foremost concerns in the world. The Crossleys of England, promptly purchased, at a cost of £20,000, the right to use the Bigelow loom in England; and A. & E. S. Higgins, of New York, and the Roxbury Carpet Company, of Massachusetts, also secured the exclusive use for the United States for tapestry and velvet during the term

CARPET-BAGGERS

of the patent. Mr. Bigelow, of course, reserved the right to manufacture Wiltons and Brussels on his own loom. It has been my experience, in a connection of over 30 years with the trade, that the Wiltons, velvets, Brussels, and tapestries made at that day by these establishments would compare favorably in durability of wear and stability of color with the same grades of any country in the world.

The success of Mr. Bigelow's looms stimulated others to like inventions. The manufacture of Axminster and moquette carpets by hand in foreign countries was one of the slowest of trade processes. In this two men and a boy were employed at one loom, and could make but one and a half yards of French moquette in a day. In 1860 Alexander Smith and Halcyon Skinner, of Yonkers, invented an Axminster and moquette power-loom which was perhaps more striking in its ability to increase the productive capacity of labor than was that of Mr. Bigelow.

This was the beginning of a second era in the trade. The invention increased the production to about 11 yards per day, the loom being attended by a girl. Its merits were universally conceded, and foreign and domestic manufacturers were glad to pay large royalties for its use. The Alexander Smith & Sons Carpet Company became one of the most famous in the world, and its plant in Yonkers is to-day the largest of the kind in the country. How thoroughly American invention and American mechanical skill have gained control of the home market can easily be understood from a few figures which I present:

In the year ending 30 June 1870 there were entered at the port of New York alone body Brussels and tapestry Brussels valued at \$1,355,832; in 1900 there were imported in the entire United States body Brussels and tapestry Brussels valued at less than \$60,000. In 1870 the manufacture of carpets in the United States amounted in value to \$21,761,573; in 1900 the value of the carpets made in the United States was over \$50,000,000.

The number of firms engaged in the various departments, with the approximate number of power-loom employed (1902) was as follows:

PRODUCTION OF CARPETS.		
Varieties	Manufacturers	Power-loom
Ingrains.....	89	4,800
Brussels and Wilton.....	16	1,200
Tapestry and Velvet.....	14	1,700
Axminster.....	6	600

These firms were capable of producing 100,000,000 yards, of the value of \$50,000,000. There are also many hand-loom on ingrain, and many manufacturers of damasks and Venetians, Smyrna and other rugs and mats.

On the artistic side the improvement has been equally great. At the outset most of our designs were copied or adapted from foreign patterns. It was only a few years ago that a foreign manufacturer, to whom I showed a sample of the first piece of tapestry produced by Stephen Sanford, remarked, after examining the fabric closely, "Well, you may be able to manufacture the goods, but you can't design them." In less than five years from that time, the same gentleman, on his way to Canada to sell goods, proposed to me to exchange samples, that he might take orders from the American patterns. After looking through his line, I thanked him, with the assurance that I could

find nothing there that could compare favorably with the discarded designs of last season's patterns of our domestic manufacture. In the fully equipped studios of the Bigelow, Lowell, Smith, Hartford, Higgins, and the Philadelphia companies a large proportion of the designers are Americans, and the proportion is steadily increasing. The American dealer of to-day has to overcome very little prejudice against either the fabric, color, or pattern of American carpets, and it is long since I have heard a customer ask, "Is it English?"

Were I able to give the exact amount of money expended each year, from the time the wool leaves the sheep's back until the carpet reaches its resting-place upon the floor of our homes, to be trodden upon, beaten, and sometimes abused, notwithstanding the fact that there is no article which goes so far to make the home comfortable and attractive, the figures would be astonishing. The people employed in designing, manufacturing, and selling this article to-day would form a sufficient population for a young republic, with abundant capital to carry on the government.

The skill and inventive genius in carpet manufacturing have so built up the home industry of the United States as to give employment to a vast army of operatives, and reduced the cost of the manufactured article to such an extent that the humblest citizen is enabled to have a floor well carpeted with fabrics that are attractive, and even artistic; and, with the thrifty housewife, the addition of a rug or two upon the carpet and a good lining underneath is necessary, in her estimation, to sustain her status as one of the social leaders in her humble sphere.

In no other time and no other country has such comparative luxury been within the reach of modest means. The white and well-scrubbed floor of the Holland frau, the polished oak and tiling of France, Germany, Italy, Austria, and the other countries of continental Europe, have given no precedent for the American indulgence in carpets; and even England, outgrowing the rush- and straw-strewn floors of the time of Erasmus, has not yet learned to fill the great gap between the velvet pile carpets of the homes of the nobility and the bare boards of the White-chapel tenements. It is in this respect that the United States stands forth pre-eminent. There are carpets for all, and from the days when the grandmothers wove their rag carpets, to the present, when a far superior article is turned out from nearly every factory in the country, at a cost cheaper even than that of the home-made article, there have been few American homes too poor to enjoy the comfort of neat and pretty floor coverings.

SHEPPARD KNAPP,
Of Sheppard Knapp & Co., New York.

Carpet-baggers, Carpet-bag Governments.

The admission of the southern negroes to the franchise after the war involved their organization and leadership, and their representation in State and national offices by intelligent whites. As no southern whites of character would undertake what they regarded as a crusade against civilization, the task fell to northern Republicans. Those who undertook it were of all grades of personal integrity and honesty of purpose, from sincere old-fashioned abolitionists

CARPET-BEETLE — CARPZOV

to mere scalawag adventurers; but they had one characteristic in common: the lack of property interests in the South to make its injury theirs. Hence the name, implying that their only possessions there were in their carpet-bags. The name was at first given only to those whose one motive for residence there was election to office from thence; and the purpose of many was voiced in the utterance of one high official, that when he could no longer hold office from there he would no longer live there. But the régime of monstrous plunder and social and industrial ruin which the system brought on, the levying of fraudulent taxes, and the piling up of huge State debts for the future, soon effaced all distinctions. All Northerners who upheld the system or tried to protect the negroes' voting rights were confounded under the name; all State governments in any way protected from overthrow by United States troops were "carpet-bag" governments; and finally the entire years of Reconstruction, and that attempt itself, are compendiously known as the "Carpet-Bag Régime."

Carpet-beetle, a small beetle (*Anihrenus scrophularia*), often wrongly called "buffalo-bug." In the grub or larval state, it is injurious to carpets and similar fabrics. It is an active, brown, hairy larva, the size of a grain of wheat, which works in a hidden manner from the under surface, sometimes making irregular holes, but more frequently following the floor-cracks and cutting long slits in a carpet. This insect was brought from Europe about 1874, and is abundant in the New England States and westward to Kansas. The adult insect is a minute, broad-oval beetle, about three sixteenths of an inch long, with a red stripe down the middle of the back. When disturbed it folds up its limbs and feigns death. As a general thing the beetles begin to appear in the autumn, and continue to issue, in heated houses, throughout the winter and following spring. Soon after issuing they pair, and the females lay their eggs in convenient spots. The eggs hatch in a few days, and the larvæ develop rapidly. Their development is retarded by cold weather or by lack of food, and they may remain alive for an indefinite period. When, under normal conditions, the larva reaches full growth, the yellowish pupa is formed within the last larval skin, from which the beetle emerges later. The beetles are day-fliers, and when not engaged in egg-laying are attracted to the light. They fly to the windows, and may often be found upon the sills or panes. The carpet beetle is very difficult to exterminate, and the best preventative is the use of movable rugs on hard-wood floors. Suspected carpets should be taken up, beaten, sprayed out of doors with benzine, and then be well aired. Before relaying the carpet, tarred roofing-paper should be laid upon the floor.

Another similar pest is the black carpet-beetle (*Attagenus piceus*), whose larva is readily distinguished from the buffalo-bug by its cylindrical shape and lighter color. It is not so fond of working in cracks and cutting long slits in carpets, and in general is not so dangerous a species as the other. It sometimes produces in feather-beds a peculiar felting of the ticking. It has also been known to infest flour-mills, and is to a certain extent a feeder upon

cereal products. Two years are required for its development from egg to beetle. Consult Howard and Marlatt, 'Household Insects' (U. S. Department of Agriculture, Washington, 1896).

Carpet-snake, a python (*Python spilotes*) of Australia and New Guinea, which takes its name from the rich variegation of its colors, which are mainly black with yellow spottings. It spends most of its time in trees, and reaches a length of six feet. See PYTHON.

Carpi, Girolama da, jê-rô'lâ-mô dâ kâr'pê, Italian painter: b. Ferrara; d. 1556. He painted many pictures for the churches of his native place, and at Bologna, and was a great admirer of Correggio and Parmegiano, whose works he copied with great success.

Carpi, Ugo da, oo'gô dâ, Italian wood-carver: b. Carpi, 1455; d. 1523. He is generally considered as the inventor of that species of carving denominated *chiaroscuro*. He was preceded in the art by Albert Dürer and Lucas Cranach (q.v.).

Carpi, kâr'pê, Italy, a town in the province of Modena and nine miles north of the city of Modena. It is the seat of a bishopric, suffragan to Bologna. It is surrounded by walls, defended by a citadel, and has a cathedral, a seminary, and manufactures of straw hats and spun silk. The neighborhood produces rice, wheat, hemp, and flax. Pop. about 6,000.

Carpio, Bernardo del. See BERNARDO DEL CARPIO.

Carpio, Manuel, mî'noo ël kâr'pê-ô, Mexican poet and politician: b. Casamaloapan, 1 March 1791; d. 11 Feb. 1860. He studied medicine and became professor of physiology in the University of Mexico, and entering political life he became a leader of the Conservatives. In 1825 and 1848 he was deputy, in 1851 senator, and in 1853 counselor of state. Several editions of his 'Poesias' have been published, the latest in 1883.

Carpoc'rates, a native of Alexandria, who in the 2d century revived several Gnostic errors. He rejected the Old Testament and the gospels of St. Matthew and St. Luke; denied the resurrection of the dead, and advocated the most licentious mode of life. Mosheim calls him "the worst of all the Gnostics."

Car'polites, a term applied to fossils of the nature of fruits, usually found in the Carboniferous system. Their exact place in the vegetable kingdom has not yet been determined.

Car'pophore, a stalk bearing the pistil, and raising it above the whorl of the stamens, as in *Passiflora*. Also applied to the stalk between the achenes of *Umbellifera*.

Carpus, in anatomy, the bones between the forearm and hand, the wrist in man, or corresponding part in other animals. See HAND.

Carpzov, kâr'p'tsôf, the name of a German family which has furnished several eminent jurists and theologians. The founder of the family was Simon Carpzov, burgomaster of Brandenburg, in the middle of the 16th century. He had two sons: Joachim, who at his death at Glückstadt in Holstein, in 1628, was commander-in-chief of the Danish army; and Benedict, b. 1565; d. 1624. He was appointed professor of law at Wittenberg in 1595, became chancellor of

CARQUINEZ — CARR

the Dowager-electress Sophia at Kolditz, but afterward returned to Wittenberg. A second Benedict, son of the former, b. Wittenberg 1595; d. 1666; became assessor of the supreme court and professor of law at Leipsic in 1645, then councilor of the court of appeal and member of the privy-council at Dresden. He was one of the most eminent jurists of his day, and is the author of several valuable legal works; but is justly censured for the severity and cruelty of his proceedings. He is said to have signed the death-warrants of not fewer than 20,000 persons. JOHANN BENEDICT CARPZOV, his brother (b. Rochlitz, 1607; d. 1657); became professor of theology at Leipsic, and is famed as the author of the 'Systema Theologicum' (1653). He left five sons, one of whom, JOHANN BENEDICT (b. 1639; d. 1669), became professor of theology and pastor of St. Thomas' church at Leipsic, distinguished himself by his knowledge of Hebrew language and literature, and translated several rabbinical works. Another member of the family, JOHANN GOTTLIEB CARPZOV, born at Dresden in 1679, became professor of Oriental languages at Leipsic, and died as superintendent at Lubeck in 1767. He was one of the most eminent theologians of his time, and wrote, among other treatises, 'Critica Sacra Veteris Testamenti' (1728); 'Introductio in Libros Canonicos Veteris Testamenti.'

Carquinez, kār-kē'nēs, or **Karquenäs**, a strait between Contra Costa and Salano counties, California; its greatest width is two miles and its length seven miles; it is navigable, and connects the bays of San Pablo and Suisun.

Carr, Dabney, American colonial politician; d. May 1773. He was a member of the house of burgesses of Virginia, and moved and eloquently supported a resolution to appoint a committee of grievances and correspondence, in consequence of British encroachments. His resolution was adopted, 3 March 1773. He married a sister of Jefferson, by whom he is described as a man of sound judgment and inflexible purpose, mingled with amiability, and of a fanciful eloquence.

Carr, Eugene Asa, American army officer: b. Concord, N. Y., 20 March 1830. He was graduated at the United States Military Academy in 1850, and joined the Mounted Rifles. He accompanied the Sioux Expedition in 1855, and was active in suppressing the insurrections on the Kansas border in 1856. In 1860 he was engaged in a campaign against the Comanche Indians. He was in active service throughout the Civil War, commanding the 4th Division of the Army of the Southwest, and subsequently acting as commander of the same army. He commanded a division in the Vicksburg campaign in 1863, and led the assault on the works of that city, 18 May. In December 1863 he was assigned to the Army of Arkansas. At the close of the war he was promoted to brigadier-general, U. S. A., and brevetted major-general of volunteers. In 1868-9 he was engaged against the Sioux and Cheyenne Indians, and afterward took part in other expeditions against hostile Indians. He fought in 13 engagements with Indians, was four times wounded in action, and received a congressional medal of honor and the thanks of the legislatures of Nebraska, Colorado, and New Mexico. He was retired in 1893.

Carr, Frank Osmond, English composer: b. near Bradford, England, 23 April 1858. He was educated at Cambridge University from which he received the degree of doctor of music in 1891. He has furnished the music to the opera librettos of 'Faddimir,' 'Joan of Arc,' and 'Out of Town,' by Arthur Reed Ropes (q.v.), and also that for W. H. Gilbert's opera, 'His Excellency.'

Carr, Henry Lascelles, English journalist: b. Knottingly, Yorkshire, 1841; d. 5 Oct. 1902. He was educated for the Anglican priesthood at St. Aidan's Theological College, Birkenhead, but after qualifying for orders decided upon a literary career. After being for some time on the staff of the Liverpool *Daily Post*, he removed to Cardiff, where he was successively sub-editor, manager, editor and part proprietor of the *Western Mail*. He retired in 1901. He published 'Yankee Land and the Yankees'; 'Letters from the United States of America.'

Carr, Joseph Bradford, American military officer: b. Albany, N. Y., 16 Aug. 1828; d. Troy, N. Y., 24 Feb. 1895. He joined the militia in 1849, and rose to the rank of colonel. In 1861 he was appointed colonel of the 28th New York Volunteers, and led them at the battle of Big Bethel and in McClellan's Peninsular campaign. He took part in the battles of Chancellorsville and Gettysburg, and for his bravery throughout the war he was brevetted a major-general of volunteers. After the war he became prominent in Republican politics in New York State, and was elected secretary of state in 1879, 1881, and 1883. In 1885 he was an unsuccessful candidate for lieutenant-governor.

Carr, Joseph William Comyns, English art critic and dramatist: b. 1849. He was educated at London University and was admitted a barrister of the Inner Temple in 1869. He has been English editor of 'L'Art' and art critic of the 'Pall Mall Gazette.' He has published 'Drawings by the Old Masters' (1877); 'The Abbey Church of Saint Albans' (1878); 'Examples of Contemporary Art' (1878); 'Essays on Art'; 'Papers on Art'; 'A Fireside Hamlet'; 'The United Pair'; 'The Naturalist'; 'The Friar'; 'Forgiveness'; 'King Arthur.'

Carr, Lucien, American archaeologist: b. Lincoln County, Missouri, 1829. He received a collegiate education and from 1876 to 1894 was assistant curator in the Peabody Museum. He has written 'Mounds of the Mississippi Valley' (1883); 'Missouri, a Bone of Contention' (1888); 'Prehistoric Remains of Kentucky' (with N. S. Shaler).

Carr, or Ker, Robert, VISCOUNT ROCHESTER, EARL OF SOMERSET, a British politician: b. Scotland; d. July 1645. He followed James I. to England when that monarch became Elizabeth's successor. James chose him as his chief favorite and adviser, knighted him, gave him a seat in the House of Lords, and assisted him in his schemes for a marriage with Lady Essex. The latter after procuring a divorce was married to the earl, and in 1615 the couple were tried for the murder of Sir Thomas Overbury. They were condemned to death but pardoned.

Carr, Sir Robert, British commissioner in New England: b. Northumberland; d. Bristol, England, 1 June 1667. He was appointed to that office by Charles II. in 1664, in conjunction

CARRACCI — CARRARA

with Nicolls, Cartwright, and Maverick. In 1664, Nicolls and Carr captured New Amsterdam from the Dutch, calling it New York, in honor of the king's brother, the Duke of York, afterward James II. Carr forced the Swedes and Dutch on the Delaware into a capitulation. He returned to Boston in 1665, and, in conjunction with his coadjutors, assumed the principal powers of government.

Carracci, or Caracci, Agostino, ä-gös-të'-nō kār-rä'-chē, Italian artist: b. Bologna 1558; d. Parma 1602. One of a family of artists who founded the Bolognese or Eclectic school of painting. He was a brother of Annibale Carracci, and distantly related to Lodovico Carracci, under whose guidance he studied art. He attained great mastery in engraving, and engraved more pieces than he painted, in order, it is said, to please his brother Annibale, who became envious of his fame after one of Agostino's pictures had obtained a prize in preference to one of his own, and another excellent picture — 'The Last Communion of St. Jerome' — had gained his brother universal admiration. In 1600 Agostino accompanied Annibale to Rome, and assisted him in painting the Farnesian Gallery. As many persons said that the engraver worked better than the painter, Annibale removed his brother, under the pretext that his style, though elegant, was not grand enough. Agostino went then to the court of the Duke of Parma, and painted there a picture representing the heavenly, the earthly, and the venal love. There was only one figure wanting when, exhausted by labor and mortification, he died. He wrote a treatise on perspective and architecture. As an engraver he deserves great praise, and often corrected the imperfect outlines of his originals.

Carracci, Annibale, än-nē-bäl'ē, Italian painter: b. Bologna, 1560; d. Rome, 1609. He worked first with his father, who was a tailor. By the advice of Lodovico Carracci he learned drawing, and made the most astonishing progress, copying first the pieces of Correggio, Titian, and Paul Veronese, and painting, like them, small pictures, before he undertook large ones. In the academy founded by the Carracci he taught the rules of arrangement and distribution of figures. He is one of the greatest imitators of Correggio. His 'St. Roque Distributing Alms,' now in Dresden, was the first painting which gave him reputation. His 'Genius of Glory' is likewise celebrated. In the Farnesian Gallery at Rome, which he, aided by his brother Agostino, painted (1600-4), there breathes an antique elegance and all the grace of Raphael. You find there imitations of Tibaldi (who painted at Bologna about 1550 with Nicolo del Abate), of Michael Angelo (the style, indeed, somewhat softened), and the excellencies of the Venetian and Lombard schools. Outside of Bologna he is acknowledged as the greatest of the Carracci. In that city, however, Lodovico is more admired. Agostino, perhaps, had more invention, and Lodovico more talent for teaching; but Annibale had a loftier spirit, and his style is more eloquent and noble. He was buried at the side of Raphael in the Pantheon. His best picture is that of 'The Three Maries,' now at Castle Howard, in Yorkshire, England.

Carracci, Lodovico, lō-dō-vē'kō, Italian painter: b. Bologna, 1555; d. 1619. He was

the eldest of the three Carracci, and is regarded as the chief founder of their school. He was the son of a butcher, and appeared at first to be more fit for grinding colors than for transferring them to canvas. But his slowness did not arise from deficiency of talent, but from zeal for excellence. He detested all that was called ideal, and studied only nature, which he imitated with great care. At Florence he studied under Andrea del Sarto, and enjoyed the instruction of Passignano. He went to Parma for the purpose of studying Correggio, who was then imitated by almost all the Florentine painters. At Bologna he endeavored to gain popularity for his new principles among the young artists, and united himself with his relatives, Agostino and Annibale Carracci, whom he sent in 1580 to Parma and Venice. In 1589 they established an academy for painters at Bologna, called the *Accademia degli Incamminati* (from *incamminare*, to put in the way), which they directed jointly till 1600, the year of the departure of Agostino and Annibale for Rome. From that time till his death Lodovico was sole director. The academy was so successful that similar institutions in Bologna had to be closed. Among his most famous pupils were Domenichino and Guido Reni. His first principle was, that the study of nature must be united with the imitation of the best masters. He soon gave an example of this principle in his 'Prophecy of John the Baptist,' in the monastery of the Carthusians, imitating in single figures the style of Raphael, Titian, and Tintoretto. The finest works of Lodovico are in Bologna, especially in the picture gallery or *Pinacoteca*, and among them are 'The Annunciation'; 'The Transfiguration'; and 'St. George and the Dragon.' He excelled in architectural views and in drawing, and in general was very thorough in all the branches of his art. He also executed several fine engravings.

Carrageen, kār'ra gēn, **Carragheen**, or **Irish Moss**, a name applied to several species of marine algae found abundantly near Waterford, Ireland, at a place called Carrageen, from which the name is derived. It abounds also on the rocks in other localities in Great Britain and Ireland, and is found on the east coast of North America. The species from which the carrageen of commerce is chiefly derived is a seaweed called *Chondrus crispus*. The frond is thick, cartilaginous, somewhat fan-shaped, and repeatedly forked; color, various shades of purple or green. It is gathered from the rocks, washed, bleached in the sun, and dried, and is then the Irish moss of commerce. In hot water it swells up, and on boiling it dissolves. The results of the analysis of Irish moss are somewhat discordant; but the main constituent is a mucilage, which differs from gums, starches, and jellies by not giving their characteristic reactions. It is nutritious, and is substituted for animal jelly and starches in the preparation of soup, jellies, creams, and similar dishes. It is of value in pulmonary troubles, and is also used by painters and others in the preparation of size. It is sometimes confounded with Iceland moss, which is a lichen. See ICELAND MOSS.

Carrara, kār-rä'rä, Italy, a city in the province of Massa-e-Carrara, Tuscany, on the Lavensa, near the Mediterranean, and 60 miles

CARRARA MARBLE — CARRENO

west-northwest of Florence. An academy of sculpture is established here, and several artists have their residence, attracted by the convenience of obtaining marble almost cost-free. Carrara has some fine churches, an academy of the fine arts, a statue of Garibaldi, and is surrounded by marble hills, which have made it celebrated. Most of the inhabitants are employed in, or in connection with, the quarries. Pop. 42,000. See CARRARA MARBLE.

Carrara (kar-ra'ra) **Marble** (so called from the city of Carrara), the variety of marble generally employed by statuary. It is a white crystalline limestone, sometimes with black or purplish veins, and occurs in deposits of enormous extent—veritable "marble mountains." Carrara marble, which was formerly supposed to be a primitive limestone, is now considered an altered sub-carboniferous limestone. The plutonic action to which it has been subjected, has served to obliterate the traces of fossils. The mountains containing the marble are situated a few miles from the sea, and reach the height of over 5,000 feet. Although the quarries have been worked for 2,000 years, having furnished the material for the Pantheon at Rome, the supply is still practically inexhaustible. Those quarries supplying the pure white marble used for statuary are the most valuable. The so-called "Carrara district," embracing the communes of Carrara, Massa, Pietrasanta, Seravezza, Stazema, and Arni, is the centre of the marble industry. Carrara and Massa are the two most important, the former having a population in the city itself of 21,000 people, with an additional 21,000 in the mountain villages surrounding it and forming part of the commune. These villages are inhabited almost entirely by the quarrymen and laboring class. The commune of Massa has a population of about 24,000. Broadly speaking, the entire male population of these two communities is actively engaged in some branch of the marble industry. There were in 1901 in the district 611 quarries in active operation, of which 345 are at Carrara, 50 at Massa, and the rest distributed among the places named above. In addition to these, there are perhaps double this number which have been opened and afterward abandoned as being unproductive, or in which, for various reasons, active work has for the time being ceased. Under the sanction of ancient laws, the mountains where the quarries are found are the property and under the direct control of the municipality of the district in which they are located. Applications for leases are made to the syndic of the town, and within a reasonable time, after survey, etc., the concession is granted. The concession is permanent, the only conditions being that the grantee should formally renew it every 30 years, pay the annual rent, and work the property. The rent is merely nominal. Failure to pay it for two successive years or to develop the property in the same length of time renders the concession void. Quarries thus leased may be sold or transferred, or left as an inheritance by the grantee at any time, without formal permission from the grantor. Until 1890 most of the output of the quarries was transported to the local mills, and to the Marina for shipping, by ox-teams. But now the quarry railroad, completed in 1890, greatly facilitates this transportation. From Carrara it makes

the difficult ascent of the mountains, through many tunnels and over high viaducts, to a point some 1,500 feet above the sea-level. Tremendous obstacles were overcome in the construction of these 15 miles of railroad, the completion of which cost about \$4,000,000. Although largely patronized by the quarry owners, it has not as yet entirely supplanted the former method of hauling by ox-team.

Carraray, Philippines, a small island about 30 miles long and 6 miles wide. It has coal deposits. The population is sparse and wholly uncivilized, subsisting by trade with the neighboring islands of Samar and Luzon.

Carré, Michel, mē-shēl kă-râ, French dramatist: b. Paris, 1819; d. Argenteuil, near Paris, 27 June 1872. He first published a volume of poems, 'Folles rimes'; then turned to the drama and wrote 'La Jeunesse de Luther' (1843) and 'Scaramouche et Pascariel.' He then worked in collaboration with other authors, especially with Jules Barbier. With him he wrote many dramas, vaudevilles, and opera librettos, several of which met with much success; among his other works are 'Van Dyck a Londres' (with Narrey, 1848); 'Jobin et Nanette' (with Battu, 1849); and 'Le Tourbillon' (with Deslandes, 1866).

Carrel, Nicolas Armand, nik-ô-la är-män ka-rêl, French writer and republican leader: b. Rouen, 8 May 1800; d. 24 July 1836. He was educated at the military school of St. Cyr. He entered enthusiastically into several of the secret political societies which were numerous in France after the restoration of the Bourbons. In 1819, when lieutenant of the garrisons of Belfort and Neubreisach, he became implicated in a conspiracy, and though his conduct escaped investigation he was removed with his regiment to Marseilles. He resigned his commission to take an active part in the politics of his time. Finally settled in Paris, he zealously prosecuted his historical and political studies, and became intimate with Thiers, Mignet, and Augustin Thierry, particularly the last. He published a 'History of the Counter Revolution in England,' and in 1830 united with Thiers and Mignet in editing the *National*, which soon rose to be the leading opposition newspaper. After the revolution his colleagues joined the government, and he was left with the chief direction of the paper, which still continued in opposition. In 1832 the *National* became openly republican. Carrel was mortally wounded in a duel with Émile de Girardin. He has been called the Bayard of republican journalism.

Carreño, Teresa, tã-rã'sã kã-rã'ñô, Venezuelan pianist: b. Caracas, 22 Dec. 1853. She was educated by her father and by Julius Hoheni; in 1862 she appeared as a concert player in New York and attracted the interest of Gottschalk, who gave her some instruction especially in regard to playing his own compositions. She has traveled widely in America, and given many concerts; she not only has a high rank as a pianist, but also has won success as a concert singer, and has published a number of musical compositions. Her first husband was Sauret, the violinist, from whom she was divorced; she has also married and divorced Tagliapietra, the singer, and Eugene d'Albert, the pianist.

CARRENO DE MIRANDA — CARRIAGE

Carreño de Miranda, Juan, hoo-än kār-rā'ñō dā mē-rān'dā, Spanish painter: b. Avilés, Asturias, 25 March 1614; d. Madrid, 1685. He was a pupil of Bartolomé Roman and Pedro de Las Cuevas in Madrid, and became court painter. He painted many portraits and excelled in religious subjects. As a colorist the Spaniards rank him with Titian and Van-dyke. His principal paintings are a 'Magdalen in the Desert,' at Madrid; a 'Holy Family,' at Toledo; and a 'Baptism of our Saviour,' at Alcalá de Henares.

Carrer, Luigi, loo-ē'jē kār'rēr, Italian poet: b. Venice, 1801; d. 23 Dec. 1850. He was professor of philosophy at Padua, from 1830 to 1833, when he went to Venice, where he conducted a literary journal for nine years, during which time he was also appointed by the municipal council professor in the school of arts and sciences, and director of the museum. Here he published several works, the most popular of which is 'L'Anello di Sette Gemme,' a poetic description of the history and customs of Venice.

Carrera, kār-rā'rā, the name of three brothers distinguished as Chilean revolutionists — José Miguel, Juan José, and Luis. The chief of them, José Miguel, was born at Santiago, 15 Oct. 1785; d. 5 Sept. 1821. They were the sons of a rich landholder in Santiago, Don Ignacio Carrera. One of them served in Europe until 1811, and attained the rank of lieutenant-colonel and commandant of a Spanish regiment of hussars. The three brothers took an active part in the revolution from its commencement, and in November 1811 obtained the effective control of the revolutionary government. José Miguel Carrera was elected first president of Chile. In 1813 he was deposed and succeeded by O'Higgins. The brothers Juan José and Luis, were apprehended in 1817 near Mendoza, on a political charge, and having been first induced to attempt an escape, were brought to trial and executed 18 March 1818. José Miguel raised a body of troops to revenge their death, and a conspiracy was formed in his favor; but it was detected and suppressed, and he himself being defeated and taken prisoner, was executed on the same spot as his brothers.

Carrera, Rafael, Guatemalan revolutionist: b. Guatemala, 1814; d. there, 14 April 1865. He was of mixed Indian and negro blood. In 1837 he placed himself at the head of a band of insurgent mountaineers. Enlisting the sympathies of the Indian population, the rebellion spread. Carrera was in turns courted and caressed by members of the opposite factions which divided the government. In February 1838, he occupied the city of Guatemala with 6,000 Indians, and succeeded in restraining his followers from anticipated pillage and massacre. Having secured his victory, he became dictator in 1840, and from 1844 to 1848 was president of Guatemala; was re-elected in 1852, and made president for life in 1854. He recalled the Jesuits, who in 1767 were banished, and in 1863 he engaged in war with Salvador. After capturing San Salvador, the capital, he deposed President Barrios and appointed Dueñas in his stead.

Carrera, Valentino, vāl ēn tē nō kār-rā'rā, Italian dramatic poet: b. Turin, 19 Dec. 1834. He is one of the most original dramatists of

Italy, especially in comedy. Among his many comedies, vaudevilles, etc., the play which won for him a wide reputation was 'La Quaderna di Nanni' (1870), a perfect picture of Florentine life. He has also written some historical sketches and narratives of travel.

Carrere, John Merven, American architect: b. Rio de Janeiro, Brazil, 9 Nov. 1858. He was of American parentage and his education was obtained in Switzerland. He graduated from the École des Beaux Arts, Paris, in 1882, and since 1884 has been a partner in the firm of Carrere & Hastings, New York. The firm designed the Ponce de Leon and Alcazar hotels at Saint Augustine, Florida, and are the architects of the New York Public Library at Bryant Square.

Carrhæ, kār'rē, the name of the site of an ancient city in northwestern Mesopotamia, supposed to have been the biblical Haran.

Carriacou, kār-rē-a-koo', the largest of the Grenadine islands, in the British West Indies, seven miles long and from two to four broad. It is well cultivated, and produces good crops of cotton. The town and harbor of Hillsborough are on its west side.

Carriage, a general term for vehicles of all sorts, especially wheeled vehicles; in a narrower sense confined to those vehicles that carry persons only, for pleasure or business. The carriage is as old as the wheel. The first man who cut two slices from a tree-trunk and mounted them on an axle was the builder of the first carriage. The early Egyptians and Assyrians knew how to make wheels, as evidenced by carvings on their monuments. Some of these show a wheel made with tire and spokes, a construction indicating considerable mechanical knowledge.

Wheels held in place by wooden pins in the axle, a pole to which the horses were attached, and a rude box open at the rear, constituted the early chariots. These and the primitive carts were always two-wheeled. Four-wheeled carriages came into use with the formation of comparatively smooth roads, being ill adapted to rough and unkept highways. The earliest vehicles were made almost wholly of wood, pinned together, the holes being often burned in, and the parts tied with thongs. The Romans made use of the two-wheeled *carruca* (from which word "carriage" is derived), but although chariots of war and carts for transportation were comparatively common from early times, the carriage proper, for conveying persons, was in very slight use before the 16th century.

As late as 1550 there were only three coaches in all Paris, and the stage coach did not make its appearance in England until 1555. When the coach and covered carriage first came into use they were considered fit only for women and children, men scorning to seek such protection from the weather as is afforded by a covered vehicle. By the opening of the 17th century the coach had become popular, and not only crowned heads, but titled families, commonly employed them, emblazoned with their arms and decorated to the highest degree. Some of the most beautiful and elegant handiwork of that period was expended in the ornamentation of coaches. Elaborate painting, upholstery, and joiner-work combined to pro-

CARRIAGE

duce the most sumptuous of vehicles. No such extreme effort at display has characterized carriages of later generations.

About 1625 the hackney coach came into existence in London, and the hired cab soon became an established institution. The increase of post-roads and general improvement in highways caused a gradual increase in private carriages and wheeled vehicles of all sorts during the 17th and 18th centuries. The bodies of these early carriages and coaches were suspended by leather straps, and depended on these, in combination with the springiness of the timber employed, to reduce the shocks and jolts to the occupants. That they were jolty enough to afford considerable exercise can be testified to by those who have taken up the modern sport of coaching in imitation of the old-time tally-ho coach. About 1700, steel springs were introduced, but they did not make very rapid headway. The C spring was a radical improvement, but gave way to the elliptic spring, which was invented in 1804 and remains in use to the present day. The rubber-tired wheel was borrowed from the bicycle about 1875, and still further added to the comfort of carriage riders, while the pneumatic tire of more recent date affords the latest refinement of comfort.

The various wheeled vehicles that may be grouped under the name "carriage" embrace a wide nomenclature, the best known being here grouped:

Auto-carriage, an automobile carriage. See AUTOMOBILE.

Barouche, a four-wheeled, falling top carriage, with low body, two inside seats facing, and an outer driver's seat.

Berlin, a four-wheeled covered carriage having a rear seat behind the body.

Britzka, or *Bract*, a four-wheeled Russian carriage with falling top and a rear seat uncovered.

Brougham, a four-wheeled covered carriage with outer driver's seat, and the fore body cut under so as to turn short. The *miniature brougham* seats only two.

Buckboard, a very simple form of carriage, in which a springboard or boards take the place of the springs, the seat being placed in the centre of the springboard.

Buggy, a light carriage with either two or four wheels, and with or without a top.

Cab (short for *cabriolet*, but of more general meaning), a carriage licensed to carry passengers for hire, usually closed, with an outer driver's seat.

Cabriolet, a two-wheeled (later four-wheeled), two-seated, covered carriage with falling top.

Calash, or *Calèche*, a two-wheeled carriage with a falling or folding top, a seat for two passengers, and a narrow seat on the dashboard for the driver; much used in Canada. The top itself is also called a calash.

Car, (1) a railway carriage; (2) a carriage of unusual magnificence, as for use in a procession; (3) a van; (4) one of various special forms of vehicle, as the Irish jaunting-car.

Cariole, a small, light, open carriage, somewhat resembling the calash.

Carryall, a four-wheeled covered carriage, light and commodious, having two or more seats.

Cart, (1) a two-wheeled, light, topless pleasure vehicle; (2) a heavy two-wheeled springless vehicle, with a strong box, for carrying rough material.

Chaise, originally a two-wheeled, one-horse vehicle with a top, the body being hung on straps; later, a light, topless, four-wheeled carriage of varying construction.

Chariot, the early two-wheeled war-carriage; also a light 18th-century coach, with one inner seat and a driver's seat.

Coach, a four-wheeled covered carriage of large size, having two or more inner seats and one or more outside—a tally-ho; also, a two-seated four-wheeled cab, or large hack.

Coupé, a four-wheeled carriage, low-bodied, with an outer driver's seat.

Curricie, a simple form of two-wheeled two-horse carriage.

Dog-cart, a light pleasure cart with back-to-back seats, the rear seat covering a box to carry a dog or dogs.

Drag, a form of coach or tally-ho, sometimes uncovered.

Drosky, a long-bodied, four-wheeled Russian carriage. In its primitive form the body is a plank on which the passengers ride astride; also, in some European cities, a public hack.

Eclaire, the French name for a public cab.

Gig, a very light, small-bodied, two-wheeled, one-horse vehicle, with seat for one.

Hack, a hackney coach; loosely, any cab.

Hackney Coach, a four-wheeled coach kept for hire.

Hanson, or *Hansom Cab*, a two-wheeled, low-bodied, one-horse, covered carriage, having a single seat, closed in with front doors, and seat for the driver behind.

Jaunting-Car, a light two-wheeled, sometimes four-wheeled, vehicle having a perch in front for the driver, and longitudinal seats extended over the wheels, and a well between them for baggage.

Landau, a coach-like vehicle having a top, the forward part of which is removable and the rear part folding.

Landaulct, a one-seated landau.

Omnibus, a four-wheeled covered carriage with long body, seats running longitudinally, a rear door with steps; often with seats on the roof.

Phacton, a light pleasure carriage of varying construction, usually low-bodied.

Rockaway, a four-wheeled pleasure carriage with two seats and permanent top.

Sociable, a four-wheeled topless pleasure carriage, with facing seats.

Stage, a four-wheeled carriage of large size, with several seats inside and on top, for long journeys; called also stage coach; loosely, an omnibus.

Sulky, a two-wheeled carriage, of skeleton construction, with a seat for one directly on the shafts.

Surrey, a light four-wheeled box carriage with two seats, and often side-bars.

Tally-ho, a four-in-hand coach.

T Cart, a pleasure cart having a T-shaped body.

Trap, a pleasure carriage; a term used very loosely.

Van, a very large covered wagon for conveying bulky articles, as furniture.

CARRIAGE AND WAGON INDUSTRY

Victoria, a four-wheeled carriage with falling top, a seat in the body for two, and an elevated driver's seat cut under.

Wagon, a heavy four-wheeled vehicle, usually with rectangular box, for carrying goods, sometimes with removable seats, and often with removable top.

Wagonette, a light wagon for pleasure riding, with longitudinal seats facing each other, and entered by steps and a door in the rear.

To these might be added many more compound names, as top-buggy, box-buggy, post-chaise, etc. It is difficult sometimes to draw the line of distinction absolutely between many of the forms of carriages here named. Even the very common names of "coach" and "cab" overlap in use, that which one would call a cab in one part of the country being known as a coach in some other section.

The important parts common to the typical form of carriage are as follows: Body, seat, top, hood, dashboard, apron, step, springs, running-gear, perch, forward gear, clip, fifth-wheel, tongue, shafts, swingletree, doubletree, axle, wheel, hub, spoke, felloe, tire. The body of a carriage is commonly made of selected hard wood, ash, oak, hickory, etc., being preferred. It is put together with iron braces, screws, mortises, and tenons, and glue. The top, if permanent, is supported on selected wood uprights, or, if falling, is framed of iron or steel rods that fold up and open into a braced position. Leather, canvas, and leatherette are used as coverings. The gear, axles, shafts, poles, etc., are commonly of wood, selected with special reference to straight grain and consequent strength. The parts are largely reinforced with metal at all points where special strength or resistance to friction is essential. The tendency is to increase the use of metal to replace wood, and many carriages are made with steel axles and side-bars.

The fifth-wheel is the circular device in which the forward axle turns, and is made of iron or steel. The axles have metal boxes, which in the old style are lubricated with axle-grease, but in many modern vehicles roller-bearings are being substituted, that run with very little or no lubrication. The regulation wooden carriage-wheel has spokes let into the hub and felloes, the whole being held together by the pressure of an iron tire. Instead of making a wheel in the form of a flat disk, the practice is to make it dishing; that is, with the spokes inclining slightly away from the body of the carriage. The reason for this is that a vehicle wheel that is one of a pair receives the most strain when the vehicle is on an incline tipped to one side. In this position of severest strain the spokes of the wheel on the lower side nearest the ground, bear the weight, and when dished are inclined to the best position to receive the load.

This dishing of the wheel produces a necessity for placing the axle box slightly out of alignment. A dished wheel running on a straight axle tends to bear against the end nut, and work off the axle. By drawing the axle skein slightly inward at the forward side this tendency is overcome, and the wheel runs true. The wire wheel, or bicycle wheel, as it is commonly called, is made on a different principle, and dishing of the spokes and drawing of the axle are unnecessary. In these wheels the hub

may be regarded as suspended from the tire, and the wire spokes are so spread that they receive the strains due to an inclined roadway to as good advantage as would the spokes of a dished wooden wheel.

Previous to 1850 most carriages were built by wheelwrights, assisted by blacksmiths, and the wheelwright's shop was to be found beside the blacksmith's shop in nearly every village. The development of carriage manufactories has changed all this, and the occupation of the country wheelwright is almost gone, a few remaining who do simply a general repairing business. The carriage factories buy their lumber and hardware and supplies in large quantities, and use up the raw material in a more economical manner than could the wheelwright. But their greatest advantage is the use of special machinery. In tirework alone there are four special machines employed, the tire-bender, tire-setter, tire-upsetter, and tire-shrinker. Special lathes have been designed for turning out spokes, axles, hubs, etc., and there are hub-borers and templates, and all the conveniences equivalent to those used in the construction of general machinery. Amesbury, Mass., is a centre of carriage manufacture, but there are factories scattered through various parts of the United States.

The term "railway carriage" was commonly employed in the early days of railroads, and is still in use in Great Britain, where "coach" is, however, the technical word, but in the United States it has given way almost wholly to the shorter and more distinguishing "car" (q.v.).

The most recent development in carriages is the auto-carriage, or automobile (q.v.).

For further information as to carriages and carriage-building, see Richardson, 'Practical Carriage Building' and 'The Blacksmith and Wheelwright.'

Carriages of Machines.—The term "carriage" is also applied to any traveling or moving part of a machine that serves to carry or transport something, usually back and forth. In this sense carriage is to be distinguished from "conveyor," which is applied to more or less similar devices for transporting something that is picked up at one point and dropped or discarded at another. Examples of machine-carriages are the lathe-carriage, being that part of the lathe that travels back and forth, carrying the cutting tool; the carriage of a planer or shaper, performing a similar office; and the typewriter carriage, being the moving part that supports the sheet of paper and the platen.

C. H. COCHRANE.

Carriage and Wagon Industry. From the earliest times of which there has been any historical record, mankind has utilized wheels as a means of transportation. On the great sculptured stones now in the British Museum, taken from the ruined city of Nimrod near Nineveh, can be seen, besides the innumerable war chariots, carts drawn by oxen, and carts drawn by men. The writer made a drawing of one of the latter kind, which shows very good construction. The wheels have six spokes and are well proportioned; probably they were about 42 inches high. The body is framed up with posts and a top rail, and the spaces are filled with handsome wickerwork. There is an arched guard over the wheel to protect the latter from contact with the overhanging load.

CARRIAGE AND WAGON INDUSTRY

The cart is loaded with logs of wood. On another slab is shown the king's chariot, with an elegant canopy over the royal head. This chariot carries, besides the king, the charioteer and an arms-bearer. In biblical history the chariot is very frequently referred to, those of the great army of Pharaoh being engulfed in the Red Sea. It is worth noting that the word "carriage" was at one time used in the sense of goods or baggage, and we find in the New Testament, "After those days we took up our carriages and went up to Jerusalem." The Greeks and Romans were, of course, familiar with the horse-drawn vehicle, and in the story of the Trojan war we find Achilles dragging the body of Hector, lashed to his chariot, around the walls of Troy. Carriages without wheels were used as late as the 17th century, when they were known as litters, having shafts behind and before, which were supported upon the backs of the horses. The litter was but a form of the sedan chair, itself a species of carriage. If we look for a carriage with wheels but without horses, we find it in the *jirikisha* of Japan, a unique vehicle drawn by manpower. The ancient chariot, with all its splendor of decoration, was but a two-wheeled cart without springs, and this, the starting-point in the evolution of the carriage, we find among many barbaric peoples, the wheels being formed of solid wood rendered circular when nature formed the trees from which they were made. Even the triumphal and funeral cars of early history were but springless carts; and ages of progress lie between a gorgeous chariot of the Cæsars and a modern buggy. Queen Elizabeth's wonderful state coach, with its highly ornamented and canopied body, was without springs. It was a sort of triumphal car for state parades. Her usual mode of locomotion was by water or on horseback.

The various forms which the modern carriage has assumed appear to be almost limitless. The old-time stage-coach has developed into the fashionable drag or tally-ho; the post-chaise and the curricle are no more; but there are still left to us innumerable forms of vehicles, of which the American buggy is perhaps the most useful and represents the highest development of the carriage-builder's art. Many of the forms came to us from England, notably the brougham, named for Lord Brougham. The landau takes its title from the town of the same name in Germany, where it was first made. A few specimens of the Irish jaunting-car have found their way to America, where they serve to remind us of the active nation with which they are popular. The hack as a name is solely American, but is of course a lineal descendant of the English hackney coach. See CARRIAGE.

Carriage-building, as an art, began to be developed in all parts of Europe about the middle of the 17th century. Steady but slow progress was made in all the great cities, and some almost elegant forms are shown in the old prints, profusely decorated. The running parts, however, were very imperfect. The first relief from the jolting of the dead-axle carriage was accomplished by suspending the body of the carriages on long leather thoroughbraces stretched from upright iron jacks which stood up from each end of the running part. The next improvement was made by transforming these stiff iron jacks into spring jacks, and by

making them of steel plates. Finally, in the early part of our own century, the spring jack was given a bold, sweeping curve, and the beautiful C spring evolved. The Collinge axle, now in common use all over the world, was perfected almost 100 years ago, and the elliptic spring, the best of all springs, was invented at about the same time. It was early in the 18th century that the post-chaise came into use for journeying, and the hackney coach and hackney cab came to take the place of the sedan chair in the great cities. This created quite a war in London between the watermen and the chairmen on the one side, and the coaches on the other.

In very old times the post-chaise had a small body hung very high on its leather straps; the wheels were very high and far apart, and the postilions rode the "near" horses. In later times this uncouth post-chaise developed into the elegant chariot, perhaps the most perfectly formed carriage ever built. This carriage, with its gorgeously draped coachman's seat, as well as the full coach similarly mounted, is now seen only at royal receptions and other state occasions in the capitals of monarchical countries. As with other inventions, the evolution of the carriage has taken place by fits and starts, the greatest progress having been made during the present century, and the field in which that progress occurred having been the United States of America.

The volume of business done by American carriage manufacturers in 1795 was exceedingly small. Technical knowledge was not wanting, however, for there were many shops which had been established in colonial days, where fine carriages were occasionally built, and many imported French and English vehicles repaired. But business languished for lack of customers. Before the War of the Revolution the rich shipping merchants of Salem, Boston, Newport, New York, Philadelphia, Baltimore, and Charleston lived in good style, as was common in those monarchical times, and imported in their own ships coaches, chariots, and phaetons, from England and France. Repair shops sprang up in all the large towns and cities, and skilled workmen came from England, Ireland, and Scotland, finding ready employment on their arrival.

A curious bit of history, clearly showing the use of carriages in New York city in 1770, came to the writer's knowledge some years ago from the late George W. W. Houghton, who embodied the facts in a lecture delivered before the New York Historical Society. The old record, which he somewhere discovered, gives a list of 59 owners of carriages; and the vehicles mentioned were 26 coaches, 33 chariots or post-chaises, and 26 phaetons—in all, there were 85 vehicles. The names of the owners were Cadwallader Colden, Daniel Horsmanden, John Watts, Oliver De Lancey, Joseph Read, Charles W. Apthorp, Colonel Roger Morris, Henry Cruger, John Cruger, James De Lancey, the widow of Governor James De Lancey, the widow of William Walton, the widow of Judge John Chambers, the widow of James McEvers, the widow Lawrence, Mrs. Waddell, Andrew Elliott, William Bayard, Nicholas Bayard, Philip Livingston, John Livingston, Robert G. Livingston, Walter Rutherford, Gerardus Beekman, Colonel Beekman, Nathaniel Marston, John

CARRIAGE AND WAGON INDUSTRY

Marston, Rev. Dr. Ogilvie of Trinity Church, Anthony Rutgers, Jacob Le Roy, David Johnson, William Axtell, Miss Lodge, Leonard Lisenard, Samuel Verplanck, Lawrence Kortright, David Clarkson, John Van Cortlandt, Robert Murray, James Jauncey, Dr. William Brownjohn, Dr. Jonathan Mallet, Thomas Tiebout, Jacob Walton, John Watkins, Nicholas Gouverneur, John Aspinwall, Hugh Wallace, Isaac Low, A. Van Cortlandt, Gerardus Duyckinck, Gen. Gage, John Read, Archibald Kennedy, Thomas Sowers, Captain John Montessor, John Leake, Abraham Montier, and Ralph Izard. Many of these names are familiar to the New Yorker of to-day, the prestige of the old families having kept pace with the march of events.

It will be observed that there were but three styles of carriages known among the old aristocracy, and they were all for town use. No similar records are to be found in other cities, but there are many ancient relics of grand chariots now to be found in Boston and vicinity, still preserved in the stables of the old families as curiosities.

The effects of the struggle for independence, and the hard times which followed, so impoverished the people that there was but little use for carriages of luxury in the early days of the present century. The tendency of all classes was essentially democratic, and rigid economy was esteemed a great virtue. This state of things was not favorable for the makers of fine carriages; but, fortunately for them, all well-to-do people required something to ride in, and that took the form of the two-wheeled chaise, immortalized by Dr. Holmes. These were in great demand as the country grew prosperous, and were built in large numbers in Boston, Salem, Worcester, Pittsfield, West Amesbury, Mass., New London and New Haven, Conn., as well as in Wilmington, Del., and Philadelphia. They had enormously high wheels, and the tops were stationary, being supported on iron posts. Curtains of painted canvas or leather covered the sides and back. These chaises were often built without dashers or aprons in the earlier times, but in later years they had falling tops and were gay with silver plate. So universally was this style of carriage in use that most carriage-makers were known as "chaise-makers," as the old signboards of 50 years ago plainly indicated. Chaise-making thrived mightily, and up to about 1840 it seemed that nothing could ever fully supplant the favorite old two-wheeler. But the buggy, which had been struggling for existence for several years, began to come to the front.

The chaise had been for generations of nearly the same form, no radical changes having been tolerated; but the buggy came in a multitude of forms, as it was new and without any recognized standard of shape to hamper the fancy of the builder. At last the door was open for novelties, and has since been still wider open, with no signs of being closed again.

The buggy is purely American in its origin, and is without doubt the greatest achievement of American carriage-makers. The body may be of any form, but the running part is always of the same, or nearly the same, type. Its common-sense construction is wholly unlike the work of any other country. It is simpler, lighter, stronger, and cheaper than any other style

of vehicle, and is so admirable in all respects that it is not likely to go out of use for at least another century.

In the early days of this century of progress a great stimulus was given to the carriage and wagon trade by the advent of the grand old stage-coach. It was elegant in form, gay with paint and gilded scrollwork, and when starting out on its journey, rocking on its tough thoroughbraces under its load of passengers and baggage, with its team of four or six Morgan horses, it was an inspiring sight. It has been said that the stage-coach was unknown in America prior to 1810, but this is a mistake. In 1776 John Hancock stole away from his duties in the Continental Congress to Tamfield, Conn., where he married the beautiful Dorothy Quincy, and took her on a wedding journey to Philadelphia by stage-coach. The incidents of the journey, including the upsetting of the coach, are duly set forth in the record of William Bant, attorney to Gov. Hancock. It is also related that Mrs. Hancock took a similar journey with her son, who was but two weeks old, to join her husband in Philadelphia. This was in 1778. The roads, however, at this early date, were little better than bridle-paths, and the chief resource for journeying was the saddle. In 1791 there were but 1,905 miles of post-roads in the States, and in these roads were many bottomless sloughs, and corduroy bridges consisting of round logs laid crosswise over swamps, sometimes for long distances. As the government and local authorities improved and extended the roads, some sort of public conveyance followed.

In New York, New Jersey, and Pennsylvania the great Conestoga wagon, broad-wheeled, and with huge canvas-covered body, was drawn over the rough roads by six or eight horses or oxen for the transportation of freight and passengers. This wagon was the prototype of the famous "prairie schooner," or emigrant wagon, of later times.

Government roads, called military roads, were built across the mountains of Virginia, connecting the East with the valley of the Ohio; also through the great forests of Maine to the town of Houlton on the New Brunswick frontier, and in many other parts of the country. They were for postal and military purposes. On all these were quickly established thriving stage lines, and the business grew very rapidly. Capital was freely invested in the varied interests directly and remotely connected with the innumerable lines which radiated from all the chief towns and cities in the country; and the investments paid good dividends.

The carriage-maker, the harness-maker, the horse-breeder, and the jolly old country tavern-keeper, with his good dinners, his well-stocked and well-patronized bar, all seem to have been prosperous and happy in the good old slow-going time.

Stage-coaches and wagons were built in many places at the time I write of. Salem, Mass., was early in the field. Osgood Bradley, of Worcester, was a large builder; the Troy coach, of Troy, N. Y., was very famous in its day; but a little later, and still more famous came the Concord coach, of Concord, N. H. The founder of the house of Abbot, Downing

CARRIAGE AND WAGON INDUSTRY

& Company, now the largest wagon-builders in New England, whose work is known throughout America as well as in South Africa and Australia, was Louis Downing, who moved to Concord from Salem, Mass., in 1815. There he began the manufacture of coaches and wagons; and after 80 years, this old house is still in the full tide of active business.

So great was the coaching business from 1810 to about 1845, that in addition to the builders hundreds of smaller shops derived their chief income from repairing and painting these fine old road coaches. See COACH.

After the War of 1812, trade and commerce entered upon a new career of prosperity. The shipping merchants were piling up wealth; manufacturing, which had grown strong by the fact that the war had thrown us wholly on our own resources, was opening up new sources of wealth, and again stylish carriages for city use were in demand. Fine coaches and chariots, hung on C springs, and made grand with the hammer-cloth coachman's seat, were built in all the large cities. Boston had two well-equipped shops for this kind of work; New Haven and Bridgeport were active and growing; Newark, N. J., became celebrated for its fine productions; and New York, Philadelphia, Baltimore, and Wilmington, Del., were supplying their own wants and sowing the seeds of greater development in later times.

About this time a considerable export trade grew up with the West Indies. The carriages shipped there were known as volantes, and were large two-wheeled vehicles with immensely long shafts. The wheels were placed so far in the rear of the vehicle, in order to give greater freedom of access, that the shaft horse had a very large share of the weight upon his back. In addition to this, the overloaded beast carried the postilion, while the leader did most of the hauling. These carriages were shipped by the sugar and molasses merchants of the northern cities to the planters of the West Indies in commercial exchange for their product, which was speedily converted into rum, then in great demand at home and abroad. Thus the carriage-maker played his part in the interchange of commodities, and trade flourished.

Farmers' wagons and carts had been made in every village in the country since the earliest time, but wagon-making as a great business began with the development of the Western States. First came the large emigrant wagon, and after that the lighter farm wagon, and, later still, wagons for the great overland current emigration, which flowed like a mighty river from the East to the gold-fields of California. Happily for the emigrants, the wagon-makers of the West were equal to the occasion. Great factories quickly grew up, stimulated by this additional demand, and among the rest the great house of Studebaker Brothers, which had its origin as far back as 1813, now came to the front, reorganized and ready for business. This firm, now the largest wagon and carriage manufacturers in the world, was just in time to take a leading part in supplying the government with army wagons for the western regiments in the Civil War. It was due to the thorough equipment of the

wagon-makers of the country that the armies of the North were better and more properly supplied with the means of transportation than any army in military history. Wagon-building is so vast in its proportions that when one visits such an establishment as that at South Bend, Indiana, he wonders where purchasers can be found for so many vehicles, a wagon being produced every 10 minutes in this one factory.

The older men of the present generation of carriage-makers have witnessed a great change in the extent as well as in the method of manufacturing. In the early years of the century, business in the old carriage towns was done on what is called the "dicker" system. Woodworkers, blacksmiths, trimmers, and painters, each did business on his own account, and swapped parts, as they termed it, the final settlements being made in finished carriages. The dealer in materials also took carriages in payment. The workmen were paid with orders for goods, and money was almost unknown in all the various transactions. The old operators, who did business in this way, used to say that the plan was much safer than the cash system, there being fewer failures and less danger of getting involved in debt.

By and by the small operators with their little shops went the way of all old-time things, and well-organized factories succeeded them. Then a multitude of inventions in machinery were eagerly taken up and utilized. Larger and larger grew the factories, more and more perfect the machinery, until the present time, when the limit of quick methods and cheap production seems to be well-nigh reached. But the end is not yet.

Much the larger number of carriages built in the great factories where machinery is employed are built in duplicate by the million, and are sold to the million at exceedingly low prices. Of course, there are many qualities among the vast variety of vehicles built by the new processes, and many grades of stock enter into their composition. As in all other manufactures, the price is a very fair indication of quality. One might think that in the rush for low prices of both builders and buyers all really good work would be superseded by low grades, and that the tendency would be steadily downward in quality; but such is not the fact. Fine work—I may say superb work, that which taxes the highest skill and care of the best designers and mechanics—is still in great demand, and will probably continue to be for all time.

There are many builders of high-grade work widely known by the public, of whom I should be glad to speak, and who are distinguished for their excellent productions; but I will name only one, easily the first in this or any other country—Brewster & Company, of New York. A visit to this great establishment—of which all American carriage-builders are justly proud—will show the appreciative observer to how high a degree of perfection, beauty, and completeness modern carriage-building has attained.

In 1872 the leading carriage-makers of the country formed an association called the "Carriage Builders' National Association." The

CARRICK — CARRIER

good that this organization has accomplished by means of its annual conventions can scarcely be estimated. All trades which have similar associations know the value of good fellowship and good feeling among competitors instead of the old-time jealous antagonism. Very early in the history of the association the decay of the useful old apprenticeship system was recognized; and as a substitute for this past method of training workmen a fund was raised by subscription for a technical school, to be established in New York city, to teach the science of carriage drafting and construction. This school has been a great success. Under able teachers a large number of talented young men have graduated, well equipped to take charge of the constructive departments in our factories. Thus scientifically trained foremen and whirling machinery now very largely take the place of the skilled workmen who formerly occupied our benches, each working by his own methods, carefully guarded, in which there was more of the rule of thumb than of science.

It is fortunate for the graduate of the technical school when, in addition to the knowledge gained in the course of his studies, he has the inborn faculty of producing new and beautiful forms; that keen sense of fair proportions and graceful lines which is the necessary qualification of a designer. Few things fashioned by human skill are more beautiful than a fine carriage; none but a true artist in his line is fit to determine its form, and none but an expert mechanic, painstaking and honest, is fit to supervise its construction. The light-weight carriages now required, the tremendous strain and rough usage which they must undergo without a sign of weakness, require the most carefully selected stock and the most watchful care in all the details of mechanical arrangement.

The volume of business done by all the carriage-makers in the country is clearly shown by the last census report, from which the following figures are taken:

AMERICAN CARRIAGE AND WAGON TRADE.

Number of establishments.....	7,632
Total number employed.....	66,842
Number of wage earners employed.....	62,540
Officers, clerks, etc.....	4,302
Capital employed.....	\$118,187,838
Miscellaneous expenses.....	6,261,469
Wages of workmen.....	29,814,911
Salaries of officers, etc.....	4,073,952
Value of all products.....	121,537,276
Cost of materials.....	56,676,073
Value of family and pleasure carriages....	51,504,176
Value of business, farm, municipal, etc., wagons.....	31,480,157
Value of automobiles, etc.....	4,680,276
Repair work.....	25,192,057

That the volume of business done in the carriage trade at the present time is fully equal to the wants of the community is evident from the exceedingly sharp competition among builders and dealers. The business, however, will certainly continue to grow as fast as the increased capacity of the purchasing class can be made to absorb the increased product.

Given that prosperity which our country and her beneficent institutions insure us, if wisdom rules, a continued advance will be made, a wider and wider market will be open to us, greater novelties will be forthcoming to tempt the lovers of new things, greater perfection will be at-

tained, and a greater number of our hard-working fraternity will find good employment with satisfactory returns.

CHAUNCEY THOMAS,
Chauncey Thomas & Co., Boston.

Car'rick, Scotland, the southern district of Ayrshire. The surface is mountainous, but in the valleys and along the shores of the Atlantic the ground is level, with a fine clay or loamy soil. It became the property of Robert Bruce, father of the Scottish king of that name, by his marriage with the heiress of the Earls of Carrick; and this title is still royal, being assigned to the eldest sons of the kings of Great Britain.

Carrickfergus, kăr-rîk-fēr'gûs, Ireland, a seaport town in the county of Antrim, 10 miles by rail northeast of Belfast. It is a municipal borough, and also a county of itself, called the county of the town of Carrickfergus. It comprises an area of about 25 square miles, of which only 129 acres is embraced in the town proper, the remainder belonging to the territory of the county. The Bay of Carrickfergus is a small indentation on the north side of Belfast Lough. It is memorable in history as the landing-place of King William III., who disembarked on its shore at the quay of the town of Carrickfergus, on 14 June 1690. The castle stands upon a rock projecting into the bay, and is still maintained as a fortress, having a number of guns on the walls and a small garrison. The public buildings besides the Episcopal, Roman Catholic, and other churches, are a town hall, court-house, market-house, etc. Pop (1891) 8,923.

Carrier, Common. See COMMON CARRIER.

Carrier, Jean Baptiste, zhôn báp-têst kăr-rē-ā, French Jacobin: b. Yolet, near Aurillac, 1756; d. Paris, 16 Dec. 1794. At the beginning of the Revolution he was an obscure attorney, but in 1792 was chosen a member of the convention. He aided in the establishment of the revolutionary tribunal, 10 March 1793, and exhibited the wildest rage for persecution. He voted for the death of Louis XVI., demanded the arrest of the Duke of Orleans, 6 April 1793, and contributed greatly to the outbreak of 31 May. On 8 Oct. 1793, he was sent to Nantes with a commission to suppress the civil war and finally put down the Vendéans. Multitudes, informally and precipitately condemned, were executed daily; but Carrier resolved to destroy the prisoners by numbers at a time and without a trial. He first caused 94 priests to be conveyed to a boat with a perforated bottom, under pretence of transporting them, but in reality with a view of having them drowned by night. This artifice was repeated a number of times, and the victims were of every age and of both sexes. These wholesale murders by drowning were called *noyades*. The executioners are also said to have sometimes amused themselves by tying together a young man and woman, who were then forced into the water; and they called the murders carried out in this way "republican marriages." It has been estimated that 15,000 individuals perished in this manner. The banks of the Loire were strewn with the dead, and the water was so polluted that drinking it was prohibited. Out of terror people refrained for a time from drawing public attention to these

CARRIERA — CARROLL

atrocities, but at last the truth began to become known, and Carrier was recalled. Shortly after the fall of Robespierre he was arrested and brought before the revolutionary tribunal, which condemned him to death, and he was guillotined accordingly.

Carriera, Rosalba, Italian painter: b. Venice 1675; d. 1757. She is chiefly known by her portraits in crayon. In 1705 she became a member of the Academy of St. Luke in Rome, and in 1720 of the Academy of Bologna. She visited Paris in 1720 and painted portraits of King Louis XV. and members of the court. She was elected a member of the French Academy and in 1721 returned to Venice. She was a great worker and toward the end of her life became blind from overwork.

Carrière, Moritz, German author: b. Griedel, Hesse, 5 March 1817; d. Munich 19 Jan. 1895. He studied philosophy at Giessen, Göttingen, Berlin, and in Italy. In 1849 he became professor of philosophy at Giessen and after 1853 held that position at Munich. He was a defender of Christianity, opposed Ultramontaniam, and was of the liberal school. He also took high rank as an art critic. Among his published works are: 'Der Kölner Dom als freie deutsche Kirche' (1843); 'Abalard und Heloise' (1844); 'Die Religion in ihrem Begriff' (1841); 'Die philosophische Weltanschauung der Reformationszeit' (1847); 'Das Charakterbild Cromwells' (1851); 'Die Kunst im Zusammenhang der Kulturentwicklung und die Ideale der Menschheit' (1863-71); 'Geschmack und Gewissen' (1882).

Carrier-Belleuse, Albert Ernest, al-bâr êr-nâ ka-rê-â-bêl-lerz, French sculptor: b. Anizy-le-Château 12 June 1824; d. Paris 3 June 1887. He was a pupil of David d'Angers, and while studying was compelled to earn his living by making models for the manufacturers of bronzes. Toward the close of his life he was director of the porcelain works at Sèvres. His works include marble sculptures and terra-cotta busts; among them are 'Angelica'; 'Madonna and Child' (in the Church of St. Vincent de Paul in Paris); 'Sleeping Hebe'; 'Forsaken Psyche'; and a number of busts of remarkable truthfulness to life.

Carrier-pigeon. See HOMING PIGEON.

Carrier Shell, or Mason Shell, a gastropod mollusk of the genus *Phorus*, which covers its shell with grains of sand, shell, coral, etc. These bits are fastened by an exudation from the mantle, and are apparently protective in their purpose.

Carrières, Louis de, French theologian of the Roman Catholic Church: b. Cluvilê 1662; d. Paris 11 June 1717. In 1689 joined the Congregation of the Oratory and became well known as a theologian. At the request of Bousset he published a 'Commentaire Littéral' (24 vols. 1701-16), reprinted Paris 1872.

Car'rington, Edward, American soldier: b. Charlotte County, Va., 11 Feb. 1749; d. 28 Oct. 1810. He was lieutenant-colonel of Gen. Harrison's artillery regiment, quartermaster-general under Gen. Greene, a delegate to the Continental Congress, and foreman of the jury in Aaron Burr's trial for treason.

Carrington, Henry Beebee, American lawyer, soldier and historian: b. Wallingford, Conn.,

2 March 1824. He graduated at Yale in 1845; taught at Tarrytown, N. Y., 1846 and at Yale Law School 1847, began the practice of law in Columbus, Ohio, in 1848, and took an active part in the anti-slavery movement. In the convention which met in 1854 to organize the Republican party, Carrington was a member of the committee appointed to correspond with persons in the different States with a view of making the movement national. In 1857 he was Adjutant-General on the staff of Gov. Chase and organized the State militia in preparation for war. In 1861 he was appointed colonel of the 18th United States infantry, served through the Civil War, and afterward was in service on the plains; was wounded in war with Sioux Indians and retired in 1870; he became professor of military science and tactics in Wabash College, Ind., a position which he held till 1873. He has written: 'Russia as a Nation'; 'American Classics'; 'Ad-sa-ra-ka, Land of Massacre'; 'Battles of the American Revolution'; 'Washington the Soldier,' and other works.

Carrington, Paul, American statesman: b. Charlotte County, Va., 24 Feb. 1733; d. 22 June 1818. He was graduated at the College of William and Mary. During the Revolution he was a member of various conventions and of the Committee of Safety; opposed the Stamp-Act resolutions of Patrick Henry; became a member of the court of appeals, and in the Virginia convention voted for the adoption of the Federal Constitution.

Carrington, Richard, English astronomer: b. Chelsea, 26 May 1826; d. November 1875. Carrington entered Trinity College, Cambridge, in 1844, to prepare for the Church, but his scientific tendencies being awakened by the lectures of Prof. Challis he turned his attention to astronomy. He held the post of observer at the University of Durham from 1849 to 1852. He was elected a Fellow of the Royal Society (7 June 1860). His work 'Observations on the Spots on the Sun' (1863) furnished data that materially affected the study of solar physics.

Carri'on-crow, any of several large carrion-eating birds. The only true carrion-crow (*Corvus corone*) is found in England. It is larger than a crow, of black plumage, and with feathered neck. It is seldom seen in flocks, and lives upon carrion, small mammals, eggs, and birds. In the southern United States the name is locally given to the black vulture (*Catharista atrata*), a bird closely related to the turkey-buzzard (q v), but smaller, and resembling it in habits and public service as a scavenger. Its bluish and spotted eggs number from one to three and are placed in a nest built under logs and bushes.

Carrion-flowers, certain species of the genus *Stapelia* (natural order *Asclepiadaceæ*), so called because of their putrid odor. In the United States the name is also given to the *Smilax herbacea*, a liliaceous plant.

Carroll, Charles, "of Carrollton," American patriot: b. Annapolis, Md., 20 Sept. 1737; d. Baltimore, 14 Nov. 1832. He attended several schools abroad; studied law in Paris and London, where he became a member of the Inner Temple; returned to his native country in 1764; was elected to the Continental Congress in 1775, and with the other members

CARROLL — CARROUSEL

signed the Declaration of Independence, on 2 August of the following year. To make certain his identity, he added 'of Carrollton' to his signature, thus distinguishing himself from another by using the name of his family mansion. After many more years of important public service to the State of Maryland and to the new republic, in 1804 he withdrew to private life at Carrollton, which was his patrimonial estate, and where as his life advanced he became an object of universal veneration. He survived by six years all the other signers of the Declaration.

Carroll, Henry King, American clergyman and editor: b. Dennisville, N. J., 15 Nov. 1848. He was on the staff of 'Hearth and Home' (Methodist), and from 1876 to 1898 was religious and political editor of the *Independent*. He has written 'The Religious Forces of the United States'; and many reviews, reports, and miscellaneous papers. He supervised the compilation of religious statistics for the 11th census, and in 1898 was appointed to prepare a report on the internal conditions of Porto Rico. In 1900 he became a secretary of the Methodist Episcopal Church Missionary Society.

Carroll, Howard, American journalist: b. Albany, N. Y., 1854. He began newspaper work in New York as reporter for the *Times*, of which he subsequently became special Washington correspondent. He has since held several responsible business positions and is the author of 'A Mississippi Incident'; 'Twelve Americans: Their Lives and Times.'

Carroll, John, American prelate: b. Upper Marlborough, Md., 8 Jan. 1735; d. Georgetown, D. C., 3 Dec. 1815. He was a cousin of Charles Carroll of Carrollton, and first Roman Catholic bishop in the United States. At the age of 13 he was sent to Belgium to be educated. He was professor (1759-71) at St. Omer's and Liège, then, becoming a Jesuit, he was made prefect of the Jesuit College at Bruges. On the suppression of the Jesuits in 1774, he returned to the United States. In 1784, at the suggestion of Franklin, he was appointed superior of the Roman Catholic clergy in the United States; was made bishop in 1789; and in 1808 was created archbishop of the archdiocese of Baltimore. Georgetown College was founded by Bishop Carroll in 1791.

Carroll, John Joseph, American Roman Catholic clergyman: b. Enniscrone County, Sligo, Ireland, 24 June 1856. He came to the United States in infancy, was educated in St. Michael's College, Toronto, Ontario, and at St. Joseph's Theological Seminary in Troy, N. Y. He became assistant priest in the Cathedral of the Holy Name, Chicago, in 1880, and subsequently rector of St. Thomas' Church there. He is a Gaelic scholar of prominence and has written 'Notes and Observations on the Aryan Race and Tongue' (1894); 'Prehistoric Occupation of Ireland by the Gaelic Aryans.'

Carroll, Lewis. See DODGSON, CHARLES LUTWIDGE.

Carron Oil, a mixture of equal parts of linseed oil and lime water, much used as a dressing for burns. It has no particular advantages over other simpler and neater dressings, notably vaseline, or oxide of zinc ointment. Its

name is derived from its use in the Carron Foundry, Scotland.

Carronade, an iron gun introduced in 1779 by the director of the Carron Foundry, in Scotland, from which it took its name, said to have been invented in 1752 by Gen. Melville, and first used in the American Revolutionary War. They were of large calibre, and lighter than common cannon; but they admitted of only a small charge of powder and had a very confined range. See ORDNANCE.

Carrot, a biennial plant (*Daucus carota*) of the natural order *Umbellifera*. It is a native of Europe, introduced into America, and is known as a troublesome weed upon poor land especially in the eastern United States. It is more favorably known by its cultivated varieties which are said to have been derived originally from Holland prior to the 16th century, since when it has become deservedly popular in all temperate climates. Certain large-rooted varieties are raised for stock feeding. The most popular culinary varieties are small, rapidly growing plants of diversely formed roots. Since they are most used as a flavoring in soups, stews, and other dishes which have not become specially popular in America, they are less cultivated here than in Europe, where these dishes are commonly made. The plants succeed best in a warm, friable, rich soil, well supplied with moisture, free from stones, weeds, etc., and in the best physical condition. The seed may be sown in drills one half foot apart as soon as the ground has become warm, since they are slow to germinate and since the seedlings are very tiny. A few radish seeds of an early maturing variety are usually planted with them to break the soil and indicate the positions of the rows, so that cultivation may be commenced early. The radishes are pulled when they reach edible size and the carrots given clean cultivation, the plants being thinned to stand two or three inches apart. When they reach edible size they are bunched and marketed. The larger growing kinds are planted in rows 24 to 30 inches apart and the plants thinned to 3 or 4 inches. When mature they are stored in pits or root cellars. Few diseases attack the carrot, and the few harmful insects are usually controlled by their parasites.

The average percentage composition of carrots is: Water 88.6; nitrogen-free extract, 7.6; carbohydrate, 1.3; protein, 1.1; fat, a trace; ash, about 1 per cent. They resemble other root and tuber vegetables in their succulence and nutritive value. They are greatly relished by stock, especially horses, but are usually replaced in American rations by cheaper foods.

Car'rotin. See CAROTIN.

Carrousel, *kä-roo-sél'*, formerly an exhibition of various knightly exercises, as riding at the ring, throwing the spear, etc., which were celebrated at the courts of princes on festival occasions with great pomp and splendor. They are very ancient, but are first mentioned in history in 842, on occasion of the meeting held by Charles the Bold and Louis the German. They were superseded by tournaments, but when these had fallen were again revived. Their introduction or revival in France took place after tournaments had fallen out of fashion in consequence of the accident which ended in the death of Henry II. Similar fêtes had already

WILD CARROT.

CARRUTH — CARSON CITY

long existed among the Moors, Spaniards, and Italians. These exhibitions were common during the continuance of the old French monarchy. The Place du Carrousel in Paris was so called from one of these fêtes given there in 1662, in honor of Mademoiselle de la Vallière. The greatest extravagancies were enacted at these displays. Recitations accompanied them, some verse in outrageous taste, and full of absurd allegorical personages, being usually recited in honor of the heroine of the fête, although genuine dramatic performances were sometimes given by professional actors. In the United States the name carrousel is applied to a merry-go-round, a machine with a revolving circular platform and fixed wooden horses, etc., upon which both children and grown people ride for amusement.

Carruth', Frances Weston, American writer: b. Newton, Mass., 12 July 1867. Since 1896 she has lived in New York, engaged in literary work. Her published volumes include: 'Those Dale Girls'; 'The Way of Belinda.'

Carruth, Fred Hayden, American journalist: b. Lake City, Minn., 1862. He was on the editorial staff of the New York *Tribune* 1888-92, and has been more recently editor of the humorous department of 'Harper's Magazine'. He has published 'The Adventures of Jones' (1895); 'The Voyage of the Rattletrap' (1896); 'Mr. Milo Bush and Other Worthies' (1899).

Carruth, William Herbert, American scholar: b. Ossawatimie, Kan., 5 April 1859. He was educated in the University of Kansas, and at Harvard, and has been professor of German in the former institution from 1887. He has published 'Schiller's Wallenstein with Introduction and Notes' (1894); and other German texts similarly edited.

Carruthers, kār-roo'therz, William A., American novelist: b. Virginia, about 1800; d. Savannah, Ga., about 1850. He was professionally a physician, but wrote a number of spirited romances founded on incidents in American history. His best work is 'The Cavaliers of Virginia, or the Recluse of Jamestown, an Historical Romance of the Old Dominion' (1832). He is the author also of 'The Knights of the Horse-Shoe' (1845).

Carrying-trade, a phrase used in political economy, and also in commercial transactions. It usually refers to the commerce of different countries with each other, and is most frequently applied to carriage by sea. In a purely commercial sense the carrying-trade is simply the carriage of commodities from one place or country to another, irrespective of the mode of conveyance. In political economy the term is used in a special and restricted sense. In considering the entire commerce of a country it may be found that a part of that commerce is not directly with any one foreign country, but consists in supplying facilities for the conveyance of goods from one foreign country to another. The ships of the United States, for example, may be employed in carrying goods between India and China. This is called a carrying-trade. The carrying-trade does not consist merely in the occasional charter of vessels to foreign merchants for a foreign voyage. Though this may be included in it, its regular organization implies more than this. A ship-

owner, instead of lending his vessels incidentally to foreign merchants, may build or purchase them expressly for the purpose of conveying goods between different foreign ports at his own risk, and may even invest capital in merchandise to be so conveyed. It is to this abnormal development of commerce that the term carrying-trade in its restricted sense is applied. It is an investment of capital common in the case of commercial communities which have acquired great surplus wealth, or from the limited range of their territory, have few home investments. From the earliest time, the principal commercial communities, especially the great trading cities of antiquity, and those of the Middle Ages which have formed communities in themselves, have embarked largely in this kind of commerce.

Carryl, Charles Edward, American broker and author: b. New York, 30 Dec. 1841. He has been a member of the New York Stock Exchange from 1874 and has published 'Davy and the Goblin,' a very popular juvenile in the manner of 'Alice in Wonderland' (1884); 'The Admiral's Caravan' (1891).

Carryl, Guy Wetmore, American humorous writer: b. New York, 4 March 1873; d. New York 1 April 1904. He was a son of C. E. Carryl (qv), and the author of 'Fables for the Frivolous' (1898); 'Mother Goose for Grown-Ups' (1900); etc.

Carson, Christopher, popularly known as KIT CARSON, American mountaineer, trapper, and guide: b. Madison County, Ky., 24 Dec. 1809; d. Fort Lynn, Col., 23 May 1868. While yet an infant his family emigrated to what is now Howard County, Mo. At 15 years of age he was apprenticed to a saddler, with whom he continued two years, when he joined a hunting expedition. The next eight years of his life were passed as a trapper, which pursuit he relinquished on receiving the appointment of a hunter to Bent's fort, where he continued for eight years more. At the expiration of this time, he chanced to meet Fremont, by whom he was engaged as guide in his subsequent explorations. In 1847 Carson was sent to Washington as bearer of despatches, and received an appointment as lieutenant in the rifle corps of the United States army. In 1853 he drove 6,500 sheep to California, a difficult but successful undertaking, and on his return to Taos was appointed Indian agent in New Mexico. He served in the Federal army during the Civil War, attaining the rank of brevet brigadier-general.

Carson, Hampton Lawrence, American publicist: b. Philadelphia, Pa., 21 Feb. 1852. He was graduated at the University of Pennsylvania in 1871, and became a lawyer, rising speedily to prominence by speeches and addresses on topics of the time. He has written: 'History of the Supreme Court of the United States'; 'The Law of Criminal Conspiracies as Found in American Cases'; 'History of the One Hundredth Anniversary of the Promulgation of the Constitution of the United States'; and is a lecturer on law at the University of Pennsylvania.

Car'son City, Nev., a city, capital of the State and county-seat of Ormsby County; on the Virginia & Truckee R.R., 32 miles south-

CARSON RIVER—CARTAGENA

east of Reno. The city is in a mining and agricultural district, and is the location of a branch mint, a Federal building, State capitol, State prison, an orphans' home, and an Indian school. The business is mainly connected with mining, agriculture, and lumbering. Here are railroad and machine shops, etc. Carson City is only 12 miles from Lake Tahoe, and, on account of its beautiful scenery at the base of the Sierra Nevada, is a popular summer resort. Pop. (1900) 2,100.

Carson River, a river of Nevada, rising in the Sierra Nevada and flowing northeast for about 150 miles. It then divides, and the main branch flows into Carson Lake, a small lake with no apparent outlet. The other branch flows in the opposite direction, and is lost in Carson Sink.

Carstairs, William, Scottish clergyman of political eminence: b. Cathcart, near Glasgow, 1649; d. 1715. He pursued his studies at the universities of Edinburgh and Utrecht. He returned to Scotland with the view of entering the ministry, but after receiving a license to preach resolved to return to Holland. As he was to pass through London, he was employed by Argyle and his party to treat with the English exclusionists and became privy to the Rye-house plot. On the discovery of that conspiracy he was apprehended. After a rigorous confinement in irons he was subjected to the torture, and endured this trial with great firmness; but being afterward deluded with the hopes of a full pardon, and assured that his answers should never be made evidence against any one, he submitted to make a judicial declaration. Being released he returned to Holland, and was received by the Prince of Orange as a sufferer in his cause. The prince made him one of his own chaplains, and procured his election to the office of minister of the English congregation at Leyden. He accompanied the prince in his expedition, and always remained about his person, both at home and abroad. During this reign he was the chief agent between the Church of Scotland and the court, and was very instrumental in the establishment of Presbyterianism, to which William was averse. On the death of William he was no longer employed on public business; but Anne retained him as her chaplain-royal, and made him principal of the University of Edinburgh. When the union of the two kingdoms was agitated he took a decided part in its favor. The memory of Carstairs is for the most part revered by his countrymen as that of an enlightened patriot; and few men of active power and influence have steered between parties more ably and beneficially.

Carstens, Asmus Jakob, Danish painter: b. St. Jürgen, near Schleswig, 10 May 1754; d. 26 May 1798. He was a miller's son, but received a superior education from his mother. He had a youthful passion for painting, but after his mother's death was placed in a mercantile house. After quitting his master, he went to Copenhagen, where he struggled on for seven years, supporting himself by portrait painting, at the same time working at a large historical picture on the 'Death of Æschylus.' He went to Italy after finishing this work, then lived at Lübeck for five years, toiling on in obscurity, when he was introduced by the poet

Overbeck to a wealthy patron, by whose aid he went to Berlin, where the merit of his 'Fall of the Angels,' a colossal picture, containing over 200 figures, gained him a professorship in the Academy of Fine Arts. Two years' labor in Berlin enabled him to accomplish his cherished wish to go to Rome, and study the works of Michael Angelo and Raphael. His best works were designs in aquarelle, and painting in fresco; he rarely painted in oil. His cartoons at Weimar have been engraved by Muller. Homer, Pindar, Aristophanes, and Dante supplied him with his best subjects; and among the painters who endeavored to infuse a classic spirit into the fine arts of the 18th century, he holds a prominent position. His works are distinguished by correctness of form and outline, gracefulness of attitude, and loftiness and vigor of expression; but they frequently exhibit a certain harshness, arising from too close imitation. He was often defective in anatomy and perspective, and having begun late to paint in oil, was unacquainted with the secrets of coloring.

Cart, a carriage with two wheels, fitted to be drawn by one horse or other animal, and used in husbandry or commerce for carrying many sorts of goods. There are various descriptions of carts used in agriculture, and for many kinds of agricultural work the cart is preferable to the wagon. The ordinary cart for heavy goods has no springs, but there are many carts provided with springs.

Cartagena, kâr ta jě'nâ, Colombia, capital of the department of Bolívar, founded Jan. 21, 1533, by Pedro de Heredia. Early in the 17th century it ranked next below Mexico among the cities of the Western world, and was called "Queen of the Indies." At that time its inhabitants numbered about 20,000, of whom 3,000 were Spaniards; it was strongly fortified, and one of the main entrepôts of commerce between the hemispheres—a distinction due, in part, to its proximity to the Isthmian route, but even more to the excellence of its harbor, which is one of the best on the northern coast of South America. As the principal stronghold of Spanish America, it was repeatedly attacked: by a French fleet in 1544; by the English under Drake in 1585; again by the French in 1697; and by the English under Vernon in 1741. The town remained Spanish until 1815, when Bolívar took it; but the same year it was surrendered to the royalists, after a memorably heroic defense; and finally it was taken by Republican forces 25 Sept. 1821. Its population at present is little more than one half the number accredited to it three centuries ago. Cartagena is situated in lat. 10° 25' 48" N., lon. 75° 34' W.

Cartagena, Spain, a city and fortified seaport and naval arsenal in the province of Murcia, and 31 miles south-southeast of the city Murcia. Its harbor is one of the largest and safest in the Mediterranean. The city, located at the northern end of the harbor, is surrounded by a lofty wall, flanked with bastions. The principal buildings are the cathedral, dating from the 13th century, now converted into a simple parish church; the old castle, supposed to date from the foundation of the city by the Carthaginians; the barracks, arsenal, presidio or convict establishment, the military hospital, the Hospital de Caridad, the artillery park, the

CARTAGO — CARTER

observatory, the convents of St. Augustine and Monjas, and several other convents and churches. Great improvements have been made recently in the accommodation for shipping by the construction of moles, wharves, breakwaters, and a floating dock. Lead smelting is largely carried on; and there are also in the neighborhood rich mines of excellent iron, which are connected with the harbor by means of a tramway about eight miles in length. Esparto grass, compressed by hydraulic power, is largely shipped; other exports are iron ore, lead and lead ore, copper ore, zinc ore, fruits, etc. Cartagena (ancient Carthago Nova) was founded by the Carthaginians under Hasdrubal about 228 B.C. It was taken by Scipio Africanus 210 B.C., and afterward became a Roman colony. In 425 A.D. the Vandals largely destroyed it; and in 711, after having been in possession of the Visigoths, it was again destroyed by the Saracens. When Spain possessed her colonies, and was in a flourishing condition, Cartagena was one of her most important naval stations, and carried on a very extensive commerce. In 1873 a body of communists obtained possession of the city and fortifications, but they were compelled to surrender in the following year. Pop., 100,000.

Cartago, kār-tā'gō, Colombia, a town in the valley of the Cauca, on the Viega, a tributary of that river. Its trade is principally in dried beef, pigs, fruits, coffee, cacao, and tobacco. The sugarcane thrives well here. Cartago is the entrepôt for the trade of Santa-Fede-Bogotá. The climate is hot, but dry and healthy. Pop. about 8,000.

Cartago, Costa Rica, a city, formerly capital of Costa Rica, on the right bank of a river of its own name, 14 miles east-southeast of San José. It was once a place of considerable commercial importance, and had a population of about 37,000. It was so ruined by an earthquake 2 Sept. 1841, that only 100 houses and a church were left standing. It had already been superseded both as a capital and a seat of commerce by San José. The railroad from San José to Limón passes through it. Near the town are the springs of Aguacaliente, and also Mount Cartago or Irazu, an active volcano, rising 11,480 feet above the sea-level. Pop. about 3,500.

Carte, Thomas, English historian: b. Clifton-upon-Dunsmoor, Warwickshire, April 1686; d. near Abingdon, 2 April 1754. He was educated at University College, Oxford, and Cambridge. His first publication was entitled 'The Irish Massacre Set in a Clear Light, etc.' in which he defended Charles I. from the common charge of secretly instigating the rebellion and massacre in Ireland in 1641. During the rebellion of 1715, a warrant was issued for his apprehension, which he eluded by concealment; and later when it was supposed that he was concerned in a conspiracy, and a reward of £1,000 was offered for his capture, he escaped to France. Here he collected material for an English edition of the 'History of Thuanus' (de Thou). At length Queen Caroline procured leave for his return to England. His important work, the 'Life of James, Duke of Ormonde,' was published in 1735-6, and gained him great reputation, especially with the Tory party. In 1744 he was arrested on a suspicion of being employed by the Pretender,

but was discharged. He published three volumes of his 'History of England' between 1747 and 1752, the fourth, which brought down the history to 1654, not appearing until after his death. The character of this work is deservedly high for research. Hume and other historians have been indebted to it, but the prejudices of the author are everywhere conspicuous.

Carte-blanche, kárt-blānch, a blank sheet of paper to be filled up with such conditions as the person to whom it is given may think proper; hence absolute freedom of action.

Carte de Visite, kart de vè-zèt, literally a visiting card, a photographic likeness executed on a card somewhat larger than a visiting card, and usually inserted in a photographic album. Cartes de visite were introduced by Disdéri in 1854.

Cartel', an agreement for the delivery of prisoners or deserters; also, a written challenge to a duel. A cartel-ship is a ship commissioned in time of war to exchange prisoners; also to carry proposals between hostile powers.

Car'ter, Elizabeth, English poet and linguist: b. Deal, 16 Dec. 1717; d. London, 19 Feb. 1806. She was the daughter of Dr. Nicholas Carter, a clergyman of Kent, and was educated by her father, soon becoming mistress of Latin, Greek, French, and German; to which she afterward added Italian, Spanish, Portuguese, Hebrew, and Arabic. She was for 50 years the friend of Dr. Johnson. Several of her poetical attempts appeared in the 'Gentleman's Magazine' before she attained her 17th year, and these procured her much celebrity. In 1739 she translated the critique of Crousaz on 'Pope's Essay on Man,' and in the same year gave a translation of Algarotti's explanation of the Newtonian philosophy. She published a translation of 'Epictetus,' in 1758.

Carter, Franklin, American educator: b. Waterbury, Conn., 30 Sept. 1837. He was graduated at Williams College in 1862, was professor of Latin there in 1865-72, and of German at Yale in 1872-81, and became president of Williams College 1882, resigning in 1901. He wrote a 'Life of Mark Hopkins' and a translation of Goethe's 'Iphigenia in Tauris.'

Carter, Sir Frederic Bowker Terrington, Canadian jurist: b. Saint John's, Newfoundland, 12 Feb. 1819; d. Saint John's 28 Feb. 1900. He was called to the Newfoundland bar in 1842, served in the Newfoundland assembly from 1855 to 1878, and two years later became chief justice of Newfoundland. He was knighted in 1878.

Carter, George B., American politician: b. Honolulu, Hawaii, 1866; was educated at Phillips Andover College and Yale University. In 1891 he was appointed Hawaiian consul at Seattle, Wash. He returned to Honolulu in 1896 and became active in island politics. He was appointed governor of Hawaii by President Roosevelt in 1903.

Carter, Henry. See LESLIE, FRANK.

Carter, James Coolidge, American lawyer: b. Lancaster, Mass., 14 Oct. 1827. He was educated at Harvard, and was admitted to the bar in New York in 1853. He was counsel for the city of New York in the famous case of the people against William Tweed, and in 1875 was appointed a member of the commission to devise a system of municipal rule for the cities

CARTER — CARTERET

of the State of New York. He has published: 'The Proposed Codification of Our Common Law' (1884); 'The Provinces of the Written and the Unwritten Law' (1889); 'The Ideal and Actual Law' (1890).

Carter, James Madison Gore, American author: b. Johnson County, Ill., 15 April 1843. He was educated at the State Normal University, St. John's College, and Northwestern University Medical School. He served in an Illinois regiment during the Civil War, being captured and taken to Libby Prison. Among his works are: 'Outlines of Medical Botany of the United States'; 'Catarrhal Diseases of the Respiratory Organs'; and 'Diseases of the Stomach'; and various monographs on medical topics.

Carter, Louise Leslie, American actress. Her stage career began 10 Nov. 1890, when she appeared in the 'Ugly Duckling' in New York. Her other roles have been the Quakeress in 'Miss Helyett'; Maryland Calvert in 'The Heart of Maryland'; Zaza in 'Zaza'; and Madame Du Barry in 'Du Barry.' She is considered one of the leading actresses of the day. See Strang, 'Famous Actresses.'

Carter, Samuel Powhatan, American naval and military officer: b. Elizabethtown, Tenn., 6 Aug. 1819; d. Washington, D. C., 26 May 1891. He became a midshipman in 1840, fought in the Mexican war in coast attack, and in 1856 took part in the capture of the Barrier forts, Canton, China. In 1861 he was detailed to go to Tennessee, where he started the Tennessee brigade. All through the Civil War he was of great service to the government, and for his gallantry was brevetted major-general of volunteers. In 1882 he was promoted rear-admiral on the retired list.

Carter, Thomas Henry, American politician: b. Scioto County, Ohio, 30 Oct. 1854. He was bred to farming, but later became a lawyer, removing to Montana in 1882. He was Montana's first representative in Congress (1891), United States senator from that State from 1895 to 1901, chairman of the National Republican Committee in 1892-6, and was appointed in 1900 United States commissioner to the St. Louis Exposition.

Carter, William H., American military officer and author: b. Nashville, Tenn. In 1868 he entered the United States Military Academy. Successively promoted, he became in 1898 lieutenant-colonel and assistant adjutant-general. He served on the frontier from 1873-97, receiving a medal of honor for distinguished bravery in action at Cibicu Creek, Arizona, in 1881. In 1897 he became connected with the War Department. He wrote: 'Horses, Saddles, and Bridles'; 'Historical Sketch 6th United States Cavalry'; and 'From Yorktown to Santiago.'

Carteret, Antoine Alfred Désiré, *ân-twân al-frâ dâ-zê-râ kâr-tê-râ*, Swiss statesman and fabulist: b. Geneva, 2 April 1813; d. there, 31 Jan. 1889. His political career was long and brilliant; and in literature he has made a name with pleasing 'Fables' (1873), frequently treating political subjects, and a novel, 'Two Friends' (1872), descriptive of Genevese customs.

Carteret, kâr'tê rê't, Sir George, English provincial proprietor: b. St. Ouen, Jersey, be-

tween 1609-17; d. 14 Jan. 1679. He had a distinguished career in the British navy, was an active supporter of the royalist cause, was made lieutenant-governor of the island of Jersey and vice-admiral. He manifested an interest in colonization and received a royal grant, "in perpetual inheritance," of certain lands in America "to be called New Jersey," the name being taken from the island of which he had been governor. In 1651 he surrendered to the commonwealth and served for a time in the French navy, returning to England at the restoration. He was made treasurer of the navy in 1661 and suspended in 1669 for mismanagement of funds. In 1664 he was made joint proprietor with Lord Berkeley of the province of New Jersey under a grant from the Duke of York, and in 1676, when the province was divided, East Jersey fell to his share. He was one of the first proprietors of Carolina.

Carteret, John, EARL GRANVILLE, British statesman: b. 22 April 1690; d. Bath, 2 Jan. 1763. He received his education at Westminster School and Christ Church College, Oxford. From Oxford he proceeded to London, plunged into the political and social excitements of the period, made the acquaintance of Swift, and in 1710 married Lady Frances Worsley. Entering the House of Lords on 25 May 1711, as second Baron Carteret, he espoused the side of the Whigs, then led by Stanhope and Sunderland, and in 1714 made his first speech in the House of Lords in support of the Protestant Succession. On the accession of George I. Carteret became a lord of the bedchamber. In 1719 he was appointed by Stanhope, ambassador extraordinary to Sweden, and succeeded in arranging two treaties of peace, the first between Sweden, Hanover, and Prussia, and the second between Denmark and Sweden. In 1721 he was appointed to one of the two foreign secretarieships, that for the "Southern Department" of Europe, and as such, attended, in 1723, the congress of Cambria, which attempted the settlement of differences between Germany and Spain, and accompanied George I. to Berlin. In 1724 Carteret was appointed lord-lieutenant of Ireland. Though he came into collision with Swift over the Drapier prosecution, the two ultimately became warm friends. Between 1730 and 1742 Carteret took the lead in the House of Lords of the party opposed to Sir Robert Walpole. When this opposition succeeded in overthrowing Walpole, Carteret became the real head of the administration, but was driven from power by the Pelhams in 1744. In the same year he became Earl Granville on the death of his mother, who had been created Countess Granville in her own right.

Carteret, Philip, English provincial governor: d. 1682. He was appointed governor of the province of New Jersey by the proprietors, Berkeley and George Carteret, and was given power to grant land to settlers. He reached New Jersey in 1665, bringing with him about 30 settlers, and settled at Elizabethtown. He avoided trouble with the Indians by adopting the wise policy of buying the land from them or requiring the colonists to do so. In 1672 he went to England for a time, but returned in 1674, and during his absence New Jersey was in the possession of the Dutch for a year, 1673-4. In 1676 when the division of the prov-

CARTERET — CARTHAGE

ince into East and West Jersey was completed, he became governor of East Jersey, holding the position till his death. Owing to conflicting claims of New Jersey and New York, he had frequent quarrels with Andros, who attempted to deprive him of his commission.

Carteret, Philip, English navigator: d. Southampton, England, 21 July 1796. He was in the expedition commanded by Wallis, in 1766, on a voyage of discovery to the South Seas. He discovered Queen Charlotte's Isles, and other isles, two of which he called Gower and Carteret. A description of his voyage was given by Hlawkesworth in the introduction to his narrative of Capt. Cook's first voyage (1773).

Cartesian Diver, Devil, or Bottle-Imp, a contrivance to illustrate the effect of the compression or expansion of air in changing the specific gravity of bodies. It is a small glass figure, hollow, and sometimes provided with a hollow bulb on its head. This is to be partly filled with water, and placed in a tall vessel, nearly full of water, and having a piece of caoutchouc secured tightly over the top. On pressing the caoutchouc the air of the vessel will be compressed; this will compress that within the figure or bulb, so admitting more water by a small aperture, and causing the figure to sink. On removing the pressure the air in the figure or bulb will expand, forcing out some of the water, and causing it to rise.

Carte'sian Oval, the name, from their earliest student, Descartes, applied to a family of curves defined as the locus of a point whose distances from two fixed points bear a stated relation to each other. The ellipse is a familiar example, though it was known and studied long before it was grouped with the cartesianes.

Carte'sianism, the system of philosophy taught by René Descartes (q.v.). At the age of 20, Descartes resolved as far as possible to eliminate from his mind all that he had ever learned from books or instructors, and to think out for himself the entire circle to knowledge. His first postulate was *Cogito, ergo sum* — "I think, therefore I exist." Inquiring next into ideas, which he defined as "all that is in our mind when we conceive a thing, in whatever way we conceive it," he regarded clearness and distinctness as the criterion of a true as distinguished from a false idea. Of all ideas in the human mind that of a God is the clearest, therefore there is a God. As in this clear conception of God infinite veracity is attributed to him, it is impossible that he could make our faculties deceive us in mathematical and metaphysical demonstrations; these sciences, therefore, are trustworthy. The actual existence of the external world is proved by the prior truth, the existence of God. Creation was and is a manifestation of the divine will. Descartes revolutionized mathematics, imparting to it a beneficial impulse. He did likewise to metaphysics. Among his immediate followers in the latter science were Geulincx, Malebranche, and Spinoza. A celebrated opponent was Gassendi. The method of Descartes was adopted by all the philosophers of the rationalistic school who flourished during the latter half of the 17th and the whole of the 18th centuries. In physics he discovered the law of the refraction of a ray of light through a diaphanous body, but

his *a priori* method was not the proper instrument for physical investigation, and his researches in that department were comparative failures.

Car'thage (conjectural native name, the Phœnician *Kereth-hadshoth*, new city, from which the Greek *Karchedon*, and the Roman *Carthago* are supposed to have been derived), the most famous city of Africa in antiquity, capital of a rich and powerful commercial republic. It was situated on the north coast, not far from the modern Tunis. According to tradition, Dido, fleeing from Tyre, came to this country, where the inhabitants agreed to give her as much land as could be compassed by an ox-hide. Dido cut the hide into small thongs, with which she enclosed a large piece of land. Carthage was founded, according to Aristotle, 287 years later than Utica. Becker supposes it to have been a joint colony or factory, in the Anglo-Indian sense, of Tyre and Utica. The actual date of its foundation is much contested. The uncertainty is accounted for probably by the gradual growth of the city, as well as by the diversity of epochs reckoned from, and the different calendars, or modes of computing time, used by the different chroniclers. The date commonly given is 878 B.C. The history of Carthage is usually divided into three periods. The first is the epoch of its gradual rise; the second that of the struggles with other states occasioned by its extended power; the third that of its decline and fall. These epochs interlock each other, and it is only as a matter of convenience that we can interpose exact dividing dates between them. The first epoch has been extended as far as to 410 B.C.: the second limited to the period chiefly distinguished by wars with Greece, 401-265; the third is the period occupied with the Roman wars, and ending with the fall of Carthage.

Carthage appears early to have been independent of Tyre, if ever she owned any direct dependence on the mother city. There existed, however, a close relationship between them, due to affinity of race and religion. This appears from various incidents in their history, as when the Tyrians refused to follow Cambyzes in a contemplated attack on Carthage, and when Alexander, having attacked Tyre, the women and children were sent to Carthage. Tyre also appears as an ally of Carthage in her second treaty with Rome; and an annual offering was sent from Carthage to Tyre for the Temple of Hercules, to the neglect of which in periods of prosperity, subsequent calamities were often attributed. There is no evidence that the government of Carthage was ever monarchical. She appears soon to have acquired an ascendancy over the earlier Tyrian colonies, Utica, Tunis, Hippo, Leptis, and Hadrumetum. This was probably gained without any effort, as the result of her material prosperity. Placed amid foreign and often hostile tribes, the African colonies of Tyre might have slight jealousies and rivalries among themselves, but their relations must, on the whole, have been friendly and confidential, and in the earlier stages of their history at least they would naturally follow the lead of the strongest among them. The rise of Carthage, then, may be attributed to the superiority of her site for commercial purposes, and the enterprise of her inhabitants. Her relations with the

CARTHAGE

native populations, as is evident from her subsequent history, would always be those of a superior with inferior races. Some of them were directly subject to Carthage, others contributed to her strength by recruiting her armies, although frequently in hostility with her. She established colonies for commercial purposes along the whole northern coast of Africa, west of Cyrenaica, and these colonies enabled her to maintain and extend her influence over the native tribes. These colonies, together with most of the earlier Phœnician colonies subject to her, possessed little strength in themselves, and easily fell a prey to an invader; hence they were in the end a source of weakness, although it is not easy to see how her prosperity could have been attained without them. It is only after the north of Africa has thus been placed at her command that Carthage appears formally on the stage of history. One of her earliest recorded contests is that with Cyrene, when the boundary between the two states was fixed, to the advantage of Carthage, at the bottom of the Greater Syrtis, the Carthaginian envoys, according to the traditional story, consenting to be buried on the spot. The immediate wants of the city were provided for by the cultivation of the surrounding territory, which alone was directly dependent on her.

Commerce naturally led Carthage to conquest. The advantages, both for the promotion and protection of her trade, of possessing islands in the Mediterranean, led to her first enterprises. Expeditions to Sicily and Sardinia appear to have been undertaken before the middle of the 6th century. The war was carried on in the latter half of this century by Mago, and his sons Hasdrubal and Hamilcar. At the same time a war arose with the Africans on account of the refusal of the Carthaginians to continue the payment of a ground-rent for their city. In this the Carthaginians were unsuccessful, but at a subsequent period they achieved their object. Sardinia was their first conquest. They guarded it with the utmost jealousy. The Romans, by the first treaty 509 B.C., were allowed to touch at it; but this permission was withdrawn in the second. It was the entrepôt of their trade with Europe, and lessened their dependence on their own territory for corn. They founded its capital, Caralis, now Cagliari. They soon after occupied Corsica, where they united with the Tyrrhenians, its previous possessors, against the Greeks. Sicily was already occupied by Greek and Phœnician colonies. The latter, on the decline of Tyre, seem to have fallen under the dominion of Carthage, which gave her a footing on the island. The Greeks were still the more powerful party, and the Carthaginians occupied themselves in promoting dissensions among their cities. When the Greeks were occupied with the Persian invasion, they organized a great expedition to take possession of the island, in which they landed 300,000 men, contributed by all their dependencies. Among these Sardinians, Corsicans, and Ligurians, the latter from the gulfs of Lyons and Genoa, are enumerated. They were totally defeated by Gelon, tyrant of Syracuse, and their leader slain, in the battle of Himera, 480 B.C. The Balearic, and many smaller islands in the Mediterranean, had already been occupied by the Carthaginians. Spain had also been colonized by them with peaceable commercial settlements. No other great enterprise took place in the first period of her history.

The war with the Greeks in Sicily was renewed in 409. Hannibal, the son of Gisco, landed an army at Lilybæum, in the spring of that year, and reduced Selinus and Himera. In a subsequent expedition Agrigentum was subdued. A pestilence seconded the efforts of Dionysius and saved Syracuse, 396 B.C. A treaty put an end to the war in 392. The struggle between the Greeks and the Carthaginians continued with varying success throughout the remainder of this period. Its most remarkable event was the invasion of Africa by Agathocles, 310 B.C. Defeated in Sicily by the Carthaginians, to avert the total ruin of his affairs, he raised an army and passed over to Africa. The most extraordinary success awaited him, showing at once the weakness of the hold which Carthage had of her external possessions on the continent, and the danger she constantly encountered from factions and dissensions within the city itself. Agathocles was the precursor of Scipio. After the death of Agathocles the Carthaginians renewed their enterprise in Sicily, and had nearly completed its conquest when the Greeks called in the aid of Pyrrhus, who for a time arrested their progress 277-5 B.C. Notwithstanding numerous and disastrous defeats in their contests with the Greeks, the Carthaginians seemed, after the departure of Pyrrhus, to have the conquest of Sicily at length within their power. A dissension with the Mamertines, their former allies, called in the Romans, and with their invasion, 264 B.C., the third period of Carthaginian history begins.

The first Punic war, in which Rome and Carthage contended for the dominion of Sicily, was prolonged for 23 years, 264 to 241 B.C., and ended, through the exhaustion of the resources of Carthage, in her expulsion from the island. The second Punic war, conducted on the side of the Carthaginians by the genius of Hannibal, lasted 17 years, 218 to 201 B.C., and after just missing the overthrow of Rome, ended in the complete humiliation of Carthage. The policy of Rome, at the end of this war, in placing Carthage, disarmed, at the mercy of her African enemies, and raising her a powerful opponent in Masinissa, occasioned the third Punic war, in which Rome was the aggressor. It lasted only three years, but served to throw a halo of glory round the fall of the republic, in whose total ruin it ended. This war, begun 150 B.C., was ended 146 B.C., in the destruction of Carthage.

The repeated and not always unsuccessful struggles of Carthage with her African neighbors, in the very midst of her schemes of foreign conquest, indicate the marvelous tension to which a power inherently so weak was wrought in those great enterprises which virtually grasped at the supremacy of the world. In this matter the experience of Carthage was not unparalleled by that of Rome; but the great difference between them was that the former was surrounded by alien tribes, the latter by races kindred in language and manners, with whom, after conquest, she could easily unite. The invasion and conquest of Spain, begun by Hamilcar and carried on by Hasdrubal and Hannibal, and which led to the second Punic war, can only be mentioned in passing.

Carthage perished leaving no historians to tell her tale; hence many interesting circumstances in her history can never be known, and

CARTHAGE

what is preserved has the color of partial and often hostile authority. The constitution of Carthage has occupied much of the attention of scholars, but still remains in many points obscure. The name of king occurs in the Greek accounts of it, and the first Carthaginian general who is recorded to have invaded Sicily and Sardinia is called Malchus, the Phœnician for king, but the monarchical constitution, as commonly understood, never appears to have existed in it. The officers called kings by the Greeks were two in number, the heads of an oligarchical republic, commonly called *suffetes*, the original name being considered identical with the Hebrew *shofetim*, judges. These officers were always chosen from the principal families, and were elected annually. It is not known if they could be re-elected. There was a Senate of 300, and the citizens were divided into classes similar to the Roman tribes, *curiæ*, and *gentes*. There was a smaller body of 30 chosen from the Senate, sometimes another smaller council of 10. Various other officers are mentioned, but the particulars regarding them are often obscure, and sometimes contradictory. There seems to have been an appeal to the people in certain circumstances, but the power at first lay almost exclusively in the hands of the oligarchy. The constitution worked well during the early part of the history of Carthage, but in its later ages the state was divided by bitter factions, and liable to violent popular tumults. Both Hamilcar and Hannibal, in their most important enterprises, experienced the opposition of the aristocratic party, led by Hanno, the head of a rival family, who appears to have been for a long period a consistent advocate of alliance with Rome.

After the destruction of Carthage, her territory became the Roman province of Africa. A curse was pronounced upon the site of the city, and any attempt to rebuild it prohibited. The attempt was, however, made 24 years after her fall, by Caius Gracchus, one of the leading men of Rome. The same plan was entertained by Julius Cæsar, and it was accomplished by Augustus. The new city became the seat of the proconsul of Old Africa in place of Utica, and continued to flourish till the Vandal invasion. It became distinguished in the annals of the Christian Church. Cyprian was its bishop, and Tertullian is supposed to have been a native of it. It was taken and destroyed by the Arabs, under Hassan, in 647.

The religion of the ancient Carthaginians was essentially that of their Phœnician ancestors. They worshipped Moloch or Baal, to whom they offered human sacrifices; Hercules, the patron deity of Tyre and her colonies; As-tarte, and other deities, which were identified with the heavenly bodies, but propitiated by cruel or lascivious rites. Their religion was considerably modified by their intercourse with the Greeks. After their defeat by Gelon he made it a condition of peace with them that they should abandon human sacrifices. Some of their deities were identified with those of the Greeks, and they adopted others of that people, and no doubt received also some of their ideas regarding them. See Arnold's and Mommsen's histories of Rome; R. B. Smith, 'Carthage and the Carthaginians'; A. Church, 'Carthage, or the Empire of Africa'; N. Davis, 'Carthage and Her Remains.'

Carthage, Mo., a city and county-seat of Jasper County, in the southwestern part of the State, situated on Spring River and on the St. Louis & S. F. and the Missouri Pac. R.R.'s, 300 miles southwest of St. Louis. It is the centre of an extensive lead region, and in addition to zinc mines and stone and lime works has flour mills, machine-shops, foundries, and various other manufactories. Carthage has a public library, parks, national banks, daily and weekly newspapers, good public schools, and is the seat of Carthage College. It is located in one of the most attractive regions of the southwest, and in recent years great public improvements have added to the handsome appearance of the city. The cultivation of gardens has been stimulated by premiums from a popular fund, and the beautifying of the city has been most remarkable. Carthage is a place of historic note on account of an engagement which occurred in the vicinity during the Civil War. Pop. (1900) 9,416. See CARTHAGE, BATTLE OF.

Carthage, Battle of. On 17 June 1861, Gen. Nathaniel Lyon, U. S. A., drove the Confederates from Booneville, Mo., and Claiborne F. Jackson, the disloyal governor of Missouri, ordered a concentration of the State troops, who adhered to him, in the southwestern part of the State, to unite with the Arkansas troops, under the command of Gen. Ben. McCulloch. Anticipating McCulloch's movement into Missouri, Lyon ordered Gen. T. W. Sweeney, with three Union regiments, a small detachment of regulars, and some artillery, from St. Louis to Springfield. These were pushed forward by rail to Rolla and thence by road, and 28 June Col. Franz Sigel, with the 3d Missouri, arrived at Sarcocix, southwest of Springfield, and 15 miles southeast of Carthage, Jasper County, an important strategic point, where it was anticipated that Jackson and McCulloch would endeavor to unite forces. Here Sigel learned that Gen. Sterling Price, with about 800 Missourians, was near Neosho, 22 miles south, and that Jackson, with other State troops, was to the north, 15 or 20 miles beyond Lamar, marching south. He concluded to move first on Price to disperse him, and then turn north on Jackson, his object being to prevent a junction of the two forces, and to open communication with Lyon, who was marching south from Booneville; but when he started after Price, on the morning of the 20th, he heard that he had retreated to join McCulloch, upon which he turned his thoughts toward Jackson, but continued his march to Neosho, where he was joined a few days later by Col. Salomon, with the 5th (Union) Missouri. Capt. Conrad's company of the 3d was left to hold Neosho, and on the 4th of July Sigel, with the two regiments and two batteries, of four guns each, marched to Spring River, a short distance southeast of Carthage, where he heard that Jackson, with over 4,000 men, was but nine miles in his front in the direction of Lamar. On the morning of the 5th, with about 1,000 men and eight guns, he advanced slowly, his train three miles in the rear, driving back the enemy's mounted skirmishers, and about nine miles beyond Carthage came upon Jackson's troops in line of battle on elevated ground, four divisions under command of Gens. James S. Rains, John B. Clark, M. M. Parsons, and W. Y. Slack, numbering nearly 5,000 men, 1,200 of whom were unarmed. About

CARTHAGE COLLEGE — CARTIER

1,800 were mounted men, armed with shotguns, and judiciously posted on the flanks of the infantry. Jackson had eight guns. After some skirmishing Sigel, at 10 o'clock, brought up seven guns and opened fire, which was promptly returned, but not effectively, for, being in want of proper ammunition, the Confederate guns were charged with pieces of chain, iron spikes, broken iron, and round stones or pebbles. After a desultory artillery fire of three hours the Confederate horsemen advanced from both flanks and making a wide circuit, to avoid Sigel's artillery, began to close in on him and threaten his train, whereupon, disposing four guns in rear and two on either flank he fell back, greatly harassed at every step, until he reached Carthage, where he made a stand. But, as the enemy were still pressing hard on him, working on both flanks and threatening the road to Springfield, he again fell back, skirmishing all the way, some two or three miles beyond Carthage, where pursuit ended, and Sigel marched to Sarcoxie, and thence by way of Mount Vernon to Springfield, where Lyon joined him on the 13th. The Union loss was 13 killed and 31 wounded, to which must be added the loss of Conrad's company of 94 men surprised and captured at Neosho, on the 5th, by Churchill's Arkansas regiment of McCulloch's command. The Confederate loss was about 30 killed and 125 wounded. The day after the engagement Jackson marched from Carthage and met McCulloch and Price coming to join him. Consult: Official Records, Vol. III.; the Century Company, 'Battles and Leaders of the Civil War,' (Vol. I.).

E. A. CARMAN.

Carthage College, Carthage, Ill., a co-educational institution organized in 1870 under the auspices of the Lutheran Church. At the end of 1902 it reported: professors and instructors, 14; students, 250; volumes in the library, 5,000; grounds and buildings valued at \$100,000.

Carthage'na. See CARTAGENA.

Car'thamin, or **Car'thamine**, the coloring-matter of safflower (*Carthamus tinctorius*), from which it is extracted by the action of sodium carbonate, which is subsequently neutralized by the addition of acetic acid. The carthamin is removed from the solution by the addition of cotton cloth, to the fibres of which it adheres strongly, coloring them a fine red when the solution from which it is deposited is acid, and yellow when it is alkaline. The carthamin may be removed from the cotton by the action of sodium carbonate, and may then be precipitated in a comparatively pure state by the addition of citric acid. When thus prepared, carthamin is a powder, red or golden green in color, very slightly soluble in water or ether, but dissolving readily in alcohol, with the formation of a purple solution. Mixed with French chalk it is used as a rouge. It has the chemical formula $C_{42}H_{54}O_7$.

Carthu'sians, an order of monks in the Roman Catholic Church, founded in 1084 by Bruno (St. Bruno), a priest of the diocese of Rheims and principal of the theological school there. What specially prompted Bruno to retire from the world was the openly confessed contempt of his bishop for piety and religion. It was a saying of this bishop that while it was a fine thing to be archbishop of Rheims, it was

too bad that he had to sing masses. Bruno, with a little band of his friends, who were of the same mind with him, sought solitude in the diocese of Grenoble, and settled in a wilderness near that city called the *Cartusium*. It was a region of terrible aspect, with naked and precipitous rocks surrounded by sterile hills; and the poet Gray, in the five Latin Alcaic stanzas which in 1741 he wrote in the album of the monastery of Cartusium or La Grande Chartreuse, notes the austere features of the locality in terms which recall the picture drawn of it by Bruno's contemporaries, the *invas rupes*, the *fera juga*, the *clivos præruptos*, the *nemorum noctem* (impassable cliffs, rugged mountains, precipitous heights, gloomy forests). His institute was the most rigorous of all the monastic orders, and the Carthusians might boast—were they given to boasting—that theirs is the only monastic order that never has had to undergo reformation to bring it back to its first rigor. Bruno gave his community a rule of life which was not committed to writing: it prescribed perpetual silence, abstinence from flesh-meats, habitual wearing of the cilicium or horsehair shirt, and the like austerities. But he retained withal his love of letters, and communicated to his brethren a taste for science and learning. Besides the customary religious exercises of all monastic institutes, his monks were required to occupy a part of the time in manual labor and the other part in the work of transcribing the ancient authors and the more important public documents and records of the time. Before long there was founded in the wilderness of the *Cartusium* a collateral branch for women recluses, under substantially the same rule.

A written rule was given to the Carthusians by Guigo, fifth prior of the Cartusium—the head of a Carthusian institute is always prior, not abbot—in 1129. It forbids the practice of austerities not prescribed by the founder and establishes in perpetuity the provisions of Bruno's rule. Guigo wrote a 'Manual for Monks' in which he names reading, meditation, prayer, and contemplation as the means of reaching the perfection of the Christian and religious life. The original establishment, the Cartusium, or La Grande Chartreuse, contributed to the mother house of the order continuously, the troublous time of the Revolution excepted, down to the year 1903, when under the law for regulation or suppression of monastic houses in France, the religious community was dispossessed and turned out of the home in which it had lived during more than 800 years. The latest rule of the order of Carthusians dates from 1581. In many respects it is not as rigorous as the rule given by Bruno and Guigo. The use of linen is still forbidden, the abstinence from flesh-meats is still enforced, as is also the rule of silence. The Carthusian "house" is still an assembly of detached small houses or cells comprised within an enclosure, with a patch of ground around each little house. The general of the Carthusians resides—rather till the expulsion of the inmates did reside—at La Grande Chartreuse, not at Rome, as do the generals of most of the religious orders.

Cartier, **SIR George Etienne**, Canadian statesman: b. St. Antoine, Verchères County, Quebec, 6 Sept. 1814; d. London, 21 May 1873. Educated at the College of St. Sulpice, Montreal.

CARTIER — CARTOON

he was admitted to the bar in 1835, took part in the rebellion of 1837, and in consequence had for a time to leave Canada. In 1848 he entered the Canadian Parliament as representative of his native county, and in 1856 became provincial secretary. Later in the same year he became attorney-general for Lower Canada, in which post he was active in behalf of legal reforms. In 1857 he was a member of the Macdonald ministry, and in 1858 became premier, remaining in this position, except for a few days, till 1862. In 1864 he declined the premiership, but accepted the office of attorney-general. He was active in bringing about the establishment of the Dominion of Canada in 1867, and held the office of minister of defense in the first Dominion cabinet. In 1868 he was created a baronet.

Cartier, Jacques, French navigator: b. St. Malo, 31 Dec. 1491; d. 1557. After gaining some experience in fishing-fleets off the Labrador coast, he commanded an expedition to North America in 1534, entering the Strait of Belle Isle, and took possession of the mainland of Canada in the name of Francis I. The next year he sailed up the St. Lawrence as far as the present Montreal. In 1541 he went out as captain-general in command of a first detachment of ships to prepare the way for Roberval, who had been named viceroy. Finding, however, that his chief did not arrive, after he had waited some time, he returned to St. Malo. The natives usually received him well, but when about to return from his second voyage he treacherously kidnapped Donnacona, one of the chiefs, and some others, in order to show them in his native country. His book, 'Discours du Voyage fait par le Capitaine Jacques Cartier aux Terres neuves de Canada,' was published in 1598.

Cartilage, one of the primary tissues of animal structures, of the connective-tissue class, characterized by its peculiar basement substance. The most abundant form of cartilage is the hyaline variety, but there are also fibrous and fibro-elastic cartilages. Hyaline cartilage, particularly abundant on the ends of the bones, is whitish and translucent, firm and elastic. The cells are imbedded in an abundant homogeneous basement substance which is made up largely of chondrin. Fibrous cartilage is less abundant, and its basement substance is fibrillated. It is found about the intervertebral cartilage masses, about the joints, and around the tendons of some of the larger muscles. The fibro-elastic form is found only in certain structures,—the epiglottis, the larynx, the Eustachian tube, and in the external ear. Cartilage tissues protect the ends of the long bones by reason of their firm elasticity. They provide strong, firm, and yet movable structures where bone, by reason of its rigidity, would not be serviceable, as in the epiglottis, larynx, etc.

Carton, Florent. See DANCOURT.

Carton, Sydney, the hero in Dickens' 'Tale of Two Cities.'

Cartoon (It. *cartone*, from Lat. *charta*, paper), a term having various significations. In painting, it denotes a sketch on thick paper, pasteboard, or other material, used as a model for a large picture, especially in fresco, oil, tapestry, and sometimes in glass and mosaic. In fresco painting, cartoons are particularly useful, because in this a quick process is necessary, and

a fault cannot easily be corrected. In applying cartoons, the artist commonly traces them through, covering the back of the design with black-lead or red chalk; then, laying the picture on the wall or other matter, he passes lightly over each stroke of the design with a point, which leaves an impression of the color on the plate or wall; or the outlines of the figures are pricked with a needle, and then, the cartoon being placed against the wall, a bag of coal-dust is drawn over the holes, in order to transfer the outlines to the wall. In fresco painting, the figures were formerly cut out and fixed firmly on the moist plaster. The painter then traced their contour with a pencil of wood or iron, so that the outlines of the figures appeared on the fresh plaster, with a slight but distinct impression, when the cartoon was taken away. In the manufacture of a certain kind of tapestry the figures are still cut out, and laid behind or under the woof, by which the artist directs his operations. In this case the cartoons must be colored. In very modern times the term is commonly applied to pictures caricaturing notable characters or events of the moment. See CARICATURE AND CARICATURISTS.

The most famous cartoons in existence are those executed by Raphael for the celebrated tapestries of the Vatican, which were made at Arras, and hence called Arazzi. Two sets of these tapestries were ordered by Leo X., one for the Vatican and the other for presentation to King Henry VIII. The second set, or fragments of it, are still in existence on the Continent. The cartoons lay for a time neglected at Arras, and have repeatedly fallen into neglect again, so that out of 25, the original number, only seven remain, and these have had to be restored. They were purchased at the advice of Rubens by Charles I. about 1630. On the sale of his effects they were purchased by the order of Cromwell for the nation, but again fell into neglect in the time of Charles II. William III. had them restored, and built a gallery for them at Hampton Court, where they remained, until in 1865 they were lent to the South Kensington Museum. The subjects of the seven are: (1) Paul Preaching at Athens; (2) The Death of Ananias; (3) Elymas the Sorcerer Struck with Blindness; (4) Christ's Charge to Peter; (5) The Sacrifice at Lystra; (6) Peter and John Healing the Cripple at the Beautiful Gate of the Temple; (7) The Miraculous Draught of Fishes. The cartoons have been repeatedly engraved, among others by Dorigny, Holloway, and Gribelin. They have also been extensively made known by photographs.

The cartoon of the School of Athens, carried to Paris by the French, and a fragment of the Battle of Maxentius and Constantine, are preserved in the Ambrosian Gallery at Milan. There are, likewise, cartoons by Giulio Romano in the Sala Borgia, by Domenichino and other Italian masters, who caused their pictures to be executed, in a great degree, by their scholars, after these cartoons. The value set upon cartoons by the old Italian masters may be seen by Giovanni Armenini's 'Precetti dello Pittura' (1687). In later times large paintings, particularly in fresco, were not executed so frequently. The artists also labored with less care, and formed their great works more from small sketches. In modern times some German artists have prepared accurate cartoons. Among them is Cornelius,

CARTOUCHE — CARTWRIGHT

whose cartoons for his fresco paintings in Munich have acquired much celebrity. He prepared, too, a cartoon for the fresco picture representing 'Joseph Interpreting the Dream.' Overbeck and Julius Schnorr may also be mentioned for their cartoons.

Cartouche, Louis Dominique, 100-*è* dômi-nêk kâr-toosh, French robber: b. Paris, about 1693; d. Châtelet, France, 28 Nov. 1721. He was the leader of a noted company of robbers, and being captured was broken alive on the wheel in 1721. His life has formed the subject of a modern French drama, and was formerly represented on the English stage.

Cartouche, or Cartouch (French *cartouche*). (1) A wooden case about three inches thick at bottom, and girt round with marline, holding 200, 300, or 400 musket-balls, with 8 or 10 iron balls weighing one pound each, to be fired from a mortar, gun, or howitzer for the defense of a pass, retrenchment, etc. Such missiles have been superseded. In French military language *cartouche* signifies the entire charge of a firearm.

(2) In architecture, sculpture, etc., an ornament representing a scroll of paper, being usually in the form of a table, or flat member, with wavings, whereon is some inscription or device. (3) The name given by the French literati to that oval ring or border which includes, in the Egyptian hieroglyphics, the names of persons of high distinction. (4) In heraldry a name given to a sort of oval shield, much used by the Popes and secular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on.

Cartridge, a case of paper, parchment, metal, or flannel suited to the bore of firearms, and holding the exact charge, including, in the case of small arms, both powder and bullet (or shot). In loading with the old style of cartridge for muzzle-loading rifles, the paper over the powder was bitten or twisted off and the powder poured in, the bullet being then inserted and rammed home. The cartridges used for breech-loading rifles contain the powder in a case of solid brass, and have the percussion-cap by which they are ignited fixed in the base. Such cases can be refilled and used a number of times in succession. Cartridges for shot-guns are similar to those for rifles, but are usually of less solid construction, being commonly of strong paper with a base of metal. Those for large guns are usually made of flannel and contain only the powder. Blank-cartridge is a cartridge without ball or shot. Cartridges for blasting are filled with dynamite or other explosive.

Cartridge-paper, a thick paper originally made for the manufacture of cartridges, but extensively used in the arts, its rough surface giving it an advantage for drawing upon, as a wall paper, and for other purposes.

Cartwright, Edmund, English inventor: b. Marnham, Nottinghamshire, 24 April 1743; d. Hastings, Sussex, 30 Oct. 1823. He was educated at University College, Oxford, and having taken orders in the Church, obtained first the living of Brampton, near Chesterfield, and afterward that of Goadby-Marwood, in Leicestershire. It was, however, only after he had reached 40 years of age that his attention was first turned to the subject on which his claim to remembrance is founded. In the summer of 1784 he

began to investigate the subject of mechanical weaving, and experiment regarding improvements. His efforts were crowned with success, and in April of the following year he brought his first power-loom into action. It was not, in fact, in respect of economy of labor, any advance upon the ordinary hand-loom; but the idea which subsequent improvements have carried so far in advance of hand-loom weaving was there. The introduction of Cartwright's loom was opposed both by manufacturers and workmen; and the first mill erected for them, containing 500 looms, was burned down. His attention once turned in the direction of mechanical improvement, he continued to make progress in discovery. He not only perfected his power-loom, but took out 10 patents for different inventions, among which was one for combing wool. He expended much of his means in these investigations, and in 1800 he received as an acknowledgment of their value a grant from Parliament of £10,000, which relieved him from straitened circumstances, although, it is said, it did not cover his expenditure. He also received premiums for various improvements from the Society of Arts and the board of agriculture.

Cartwright, John, English reformer, brother of Edmund Cartwright (q.v.): b. Marnham, Nottinghamshire, 17 Sept. 1740; d. London, 23 Sept. 1824. He entered the navy in 1758, and became a first lieutenant in 1766. In 1774 his attention was turned to politics. In his 'Letters on American Independence' (Independence of America considered as supremely useful and glorious to Great Britain), written in this year, he advocated a union between the colonies and the mother state, under separate legislatures, and argued this great question on the foundation of natural, inherent right; maintaining "that the liberty of man is not derived from charters, but from God, and that it is original in every one." In 1775 he was appointed major of the Nottinghamshire militia, and after several ineffectual attempts on the part of government to remove him from that post, his dismissal was finally accomplished in 1792, in consequence of an act of Parliament. In the American war Lord Howe was desirous of having him with him in America; but Major Cartwright, although always eager for promotion in the navy, refused the proposal, alleging that he could not fight in a cause which he disapproved. From this time he devoted himself to the favorite objects of annual parliaments and universal suffrage. He was the author of a Declaration of Rights, distributed by the Society for Constitutional Information. The French revolution was warmly welcomed by Cartwright. In the trials of Tooke, Hardy, Thelwall, and other reformers, Cartwright was present as a witness, and displayed much firmness and fearlessness. By his writings, public addresses, etc., he continued to promote the work of reform and constitutional liberty; and as late as 1820 was tried for conspiracy and sedition, for advising the inhabitants of Birmingham, which had then no parliamentary representative, to send what he called their "legislatorial attorney" to the house; but he escaped with a fine of £100. Major Cartwright was not a political reformer only. The plan of making the slave-trade piracy is said to have been first developed in his 'Letters on the Slave-Trade.' A statue has been erected in London to his memory.

CARTWRIGHT — CARVAJAL

Cartwright, Peter, American Methodist clergyman: b. Virginia, 1 Sept. 1785; d. near Pleasant Plains, Ill., 25 Sept. 1872. He was ordained in Kentucky in 1806, and in 1823 removed to Illinois, where he labored for nearly half a century. He also sat in the State legislature there, and in 1846 was defeated by Abraham Lincoln in an election for congressman. Admired for his eloquence and strong common sense, he was also loved for his quaint eccentricity of manner, and possessed great influence in his own denomination.

Cartwright, Sir Richard John, Canadian statesman: b. Kingston, Ont., 4 Dec. 1835. He was educated at Trinity College, Dublin, and entered Canadian politics as a Conservative, but on account of a disagreement with Sir John A. Macdonald joined the Liberal party. He has served in the Canadian Parliament almost continually since 1863. He was minister of finance from 1873 until 1878, when his opposition to the policy of protection caused his downfall. He is an able speaker and an authority on finance. In 1897 he was a member of a Canadian commercial commission to the United States. He was knighted in 1879.

Cartwright, Thomas, English Puritan divine: b. Hertfordshire, 1535; d. Warwick, 27 Dec. 1603. He suffered imprisonment and exile more than once for his nonconformist opinions. He was a learned man, and at one time professor of divinity at Cambridge. His chief books are: 'A Second Admonition to the Parliament' (the first one having been published in 1572); 'A Confutation of the Rhemist's Translation'; 'Harmonia Evangelica'; and a criticism of Hooker's 'Ecclesiastical Polity.'

Carucate, kār'û kât, in mediæval times, as much land as one team could plow in the year. The size varied according to the nature of the soil and practice of husbandry in different districts.

Carupano, kā-roo'pā-nō, Venezuela, a seaport of the State of Bermudez, on the north coast of the peninsula of Paria, with a light-house and good roadstead. The surrounding district is fertile, and has mines of copper, sulphur, silver, lead, and lignite. The city exports cocoa, coffee, fish, etc., and has various manufactures. Pop. about 10,000.

Carus, kā-rūs, Julius Victor, German zoologist: b. Leipsic, 25 Aug. 1823. After studying at Leipsic, Wurzburg, and Freiburg, he became at the age of 26 keeper of the Oxford museum of comparative anatomy. In 1853, two years after his return to his native city, he was appointed professor of comparative anatomy and director of the Zoological Institute there. Among his numerous writings are: 'System der Tierischen Morphologie' (1853); 'Handbuch der Zoologie'; and 'Geschichte der Zoologie.' He has translated most of Darwin's works into German.

Carus, Karl Gustav, goo'stäf, German physician and physiologist: b. Leipsic, 3 Jan. 1789; d. Dresden, 28 July 1869. He became professor of midwifery at the Medical Academy, and then royal physician, being subsequently a privy-councilor. He published a great number of writings covering a wide field of science, including medicine, physiology, anatomy, psychology, physics, painting, besides

memoirs of his life. Among these are 'System der Physiologie' (1838-40); 'Lebenserinnerungen und Denkwürdigkeiten' (1865-6); 'Lehrbuch der Zootomie' (1818); 'Über den Blutkreislauf der Insekten' (1827); 'Psyche' (1851).

Carus, kār'ūs, Marcus Aurelius, Roman emperor: b. Neronæ, Dalmatia, about 222 A.D.; d. near Ctesiphon, Mesopotamia, 283. His father was an African, and his mother a noble Roman lady. He was proclaimed emperor by the legions, on the assassination of Probus, 282. He caused justice to be executed upon the assassins. He gained a signal victory over the Sarmatians, and prosecuted the war against the Persians. Undertaking the campaign in mid-winter, and making a rapid march through Thrace and Asia Minor, he ravaged Mesopotamia, made himself master of Seleucia, and carried his arms beyond the Tigris.

Carus, Paul, American philosophical writer: b. Ilseburg, Germany, 18 July 1852. He was educated in the universities of Strassburg and Tübingen, and has been a resident of Chicago for several years, where he is editor of 'The Open Court' and 'The Monist.' He has published: 'The Ethical Problem'; 'Fundamental Problems'; 'The Soul of Man'; 'Primer of Philosophy'; 'Truth in Fiction'; 'Monism and Meliorism'; 'The Religion of Science'; 'The Philosophy of the Tool'; 'Our Need of Philosophy'; 'Science: a Religious Revelation'; 'The Gospel of Buddha'; 'Kanna'; 'Nirvana'; 'Homilies of Science'; 'Chinese Philosophy'; 'The Idea of a God'; 'Buddhism and Its Christian Critics'; 'The Dawn of a New Era'; 'Kant and Spencer'; 'The Nature of the State'; 'The History of the Devil'; 'Whence and Whither'; 'Eros and Psyche.'

Carus-Wilson, Charles Ashley, Canadian scientist: b. Eastry, England. He was graduated at Cambridge (1887) and became a civil engineer. Since 1890 he has been professor of engineering science at McGill University. He has written 'Electro-Dynamics,' and many monographs on his science.

Carutti di Cantogno, Domenico, dô-mā'-nē-kō ka-rūt'tē dē kân-tōn'yō, Italian historian and publicist: b. Cumiana, near Turin, 26 Nov. 1821. As a young man he took to romance writing, but was speedily absorbed in politics and rose to great distinction. When he resumed the pen, it was to compile such solid works as 'History of the Reign of Victor Amadeus II.' (1856) and 'History of the Reign of Charles Emanuel III.' (1859), which are interesting and scholarly.

Carvajal, kar-vā-hāl', Gas'par de, Spanish missionary: b. Spain, early in the 16th century; d. Lima, Peru, 1584. He entered the Dominican order and went to Peru in 1533. In 1538 he accompanied the expedition of Gonzalo Pizarro to the countries east of the Quito as chaplain. He was appointed sub-prior of the convent of San Rosario at Lima; after the pacification of Peru he was sent to the mission of Tucuman and after working among the Indians there was made vicar-national of the province of Tucuman. With the aid of the Dominicans, whom he brought into the country, he established several Indian towns and Spanish colonies.

CARVAJAL — CARVER

Carvajal, Tomas José Gonzales, tō'mā hō'sā gōn tha'lēs, Spanish statesman and author: b. Seville, 21 Dec. 1753; d. 9 Nov. 1834. He was appointed in 1795 governor of the new colonies in Sierra Morena and Andalusia, and protested against the French invasion of Spain in 1808. From 1809 to 1811 he served as commissary in the Spanish army against Bonaparte; in 1813 became minister of finance; relinquished these offices to assume the directorship of the royal university of Isidro, where he became involved in difficulties by establishing a professorship of constitutional law. He was arrested and detained in prison from 1815 to 1820, when the revolution reinstated him at San Isidro. A counter revolution brought his opponents into power, and he was exiled from 1823 to 1827. However, at the time of his death he was member of the supreme council of war, of the military department of the Spanish and Indian boards, and a grandee of Spain. He learned Hebrew at the age of 57 in order to translate the Psalms. This translation has gained for him a high reputation for poetical power.

Carvalho, José da Silva, hō'sā dā sēl vā kār-vāl'yō, Portuguese statesman: b. Beira 1782; d. 3 Feb. 1845. He was a member of the regency and appointed minister of justice until 1823, when, on the downfall of the constitutional government, of which he was a foremost champion, he was obliged to resort to flight to England, where he remained until 1826, when he returned to Lisbon, but Don Miguel's success again compelled him to leave. Eventually he was named a member of the council of guardianship instituted by Don Pedro for the young queen, Donna Maria, and succeeded in negotiating the first English loan for Portugal. Having accompanied Don Pedro to the Azores, he filled, on his return to Portugal, important offices, and became finance minister in 1832. In 1835 he retired with the Palmella administration, and was presently obliged to retire to England, where he remained until 1838, when a general amnesty was proclaimed.

Carvalho, Paéz de Andrade, Manuel de, pā-ēth' dā ān-drā'dā ma'noo-ēl dā kar-vāl'yō Brazilian politician: b. about 1795; d. Rio de Janeiro, 18 June 1855. Elected temporary president of Pernambuco in December 1823, he led a revolt the next year against Pedro I., the emperor, and on 2 July 1824, announced a republic entitled 'Confederaçao do Equador.' On the suppression of the revolt in October, Carvalho fled to England, but subsequently returned to Brazil and was a senator from 1835.

Carvel-built, a term applied to a ship or boat, the planks of which are all flush and not overlapping, as in clinker-built boats.

Carver, John, first governor of the Plymouth colony: b. England, about 1575; d. Plymouth, Mass, April 1621. He joined the Leyden colony of English exiles about 1608, and as their agent assisted in securing a charter from the Virginia Company and in selecting and equipping the Mayflower. He was elected governor, probably 11 Nov. 1620, after the Mayflower reached Provincetown, showed great ability and judgment in governing the infant colony after the landing at Plymouth, and established by a treaty with the Indians peaceful relations that remained for many years

undisturbed. He was re-elected in March 1621, but died a few days afterward. His chair and sword are still preserved as Pilgrim relics.

Carver, Jonathan, American traveler: b. Stillwater, N. Y. (the universal ascription to Connecticut is an error), 1732; d. London, 1780. He embraced a military career, and in the French war of 1756 commanded a company of provincials, in the expedition across the lakes against Canada. When peace was concluded in 1763, Carver undertook to explore the vast territory which Great Britain had gained. His object was to acquire a knowledge of the manners, customs, languages, soil, and natural productions of the nations and region beyond the Mississippi, and to ascertain the breadth of the continent by penetrating to the Pacific over its widest part, between lat. 43° and 46° N. He accordingly set out from Boston in 1766, and having reached Michilimackinac, the remotest English post, applied to Mr. Rogers, the governor, for an assortment of goods as presents for the Indians dwelling in the parts through which his course was to be directed. Receiving a portion of the supply which he desired, and a promise that the residue should be sent to him at the Falls of St. Anthony, he continued his journey. But not obtaining the goods at the appointed place, in consequence of their having been disposed of elsewhere by those to whom the governor had intrusted them, he found it necessary to return to La Prairie du Chien. He then, in the beginning of the year 1767, directed his steps northward, with a view of finding a communication from the heads of the Mississippi into Lake Superior, in order to meet, at the grand portage on the northwest side of that lake, the traders that usually came about this season from Michilimackinac, from whom he intended to purchase goods, and then to pursue his journey. He reached Lake Superior in good time; but unfortunately the traders whom he met there could not furnish him with any goods, as they had barely enough for their own purposes, and, in consequence, he was obliged to return to the place whence he first departed, which he did in October 1768, after remaining some months on the north and east borders of Lake Superior, and exploring the bays and rivers that empty themselves into that body of water. He soon after repaired to England with the view of publishing his journal and charts, and of obtaining reimbursement for the expenses which he had incurred. Having undergone a long examination before the lords commissioners of trade and plantations, he received permission to publish his papers; but when they were nearly ready for the press an order was issued from the council-board, requiring him to deliver immediately into the plantation office all his charts and journals. He was, consequently, obliged to repurchase them at a great expense from the bookseller to whom he had disposed of them — a loss for which he received no indemnification, but was forced to be satisfied with that obtained for his other expenses. He had fortunately kept copies of his papers, and he published them 10 years afterward in Boston, while in the situation of a clerk of a lottery. He died in want of the common necessities of life in 1780, aged 48 years. His works are: 'Travels Through the Interior Parts of North America' (1778); 'Treatise on the Culture of the Tobacco Plant' (1779).

CARVING — CARY

Carving, as a branch of sculpture, the art of cutting a hard material by means of a sharp instrument: but there are extended uses of the term, as shown below.

The term is generally employed for work which is strictly decorative as distinguished from grand sculpture; thus the wrought stone leafage, scroll work and even animal forms in a Gothic porch are *carving* in common parlance, and so are the human figures of the porch if they are conventional or stiff, as often happens in mediæval work. In a Roman temple or a neo-classic edifice the leafage of Corinthian capitals or of any panel or string-course would be called *carving*, while the statues and even the reliefs of human subjects would be spoken of as sculpture (q.v.). Small pieces, even of human subjects, such as decorative statuettes and groups, are spoken of as carving, and these may be wrought in wood, ivory, bone, marble, and other stones, and even in hard and semi-precious stones, such as agate and jade. The carvings of the Chinese and Japanese are especially in demand in western lands, because of their picturesque beauty. When they are of wood they are often painted, gilded or lacquered with a rich polychromatic effect.

Throughout the middle ages of Europe, ivory statuettes, backs of mirrors, and purely ornamental objects were treated in the same way, the carving being helped out by color and gold with extraordinary results.

Carving, when done in very hard material, such as rock crystal and jade, requires much use of the drill, in which case the meaning of the term must be extended to include the result produced by a rapidly revolving pin with emery powder or the like. One of the most ingenious and useful purposes to which carving has been converted in more modern times is that of engraving wood-cuts or blocks for printing. (See WOOD-ENGRAVING.) Carving has been applied to almost innumerable uses in manufactures as well as in art. Some of these applications have given way to the art of engraving in metal and other processes, but new ones are continually arising. The first carving-machine was invented about 1800, and many others have since been patented.

Cary, Alice, American poet: b. near Cincinnati, Ohio, 26 April 1820; d. New York, 12 Feb. 1871. When quite young she began writing sketches and poems for the press, and in 1852 she, with her sister, Phœbe (q.v.), removed to New York, where they lived during the rest of their lives. In 1850 the sisters published a volume entitled 'Poems by Alice and Phœbe Cary.' Alice soon after published 'Clovernook, or Recollections of Our Neighborhood in the West' (1851-3); 'Lyra, and Other Poems' (1853); 'Hagar, a Story of To-day' (1852); 'Married, not Mated,' a novel (1856); 'Lyrics and Hymns'; 'The Bishop's Son'; 'The Lover's Diary' (1867); and 'Snow Berries: A Book for Young Folks' (1869). The verse of the Cary sisters still retains a hold upon the affections of readers and not a few lines of theirs have become familiarized by frequent quotation. While living in New York they attracted about them a circle of literary people, and for 15 years their Sunday evening receptions were a feature in the literary life of the city.

Cary, Annie Louise, American singer: b. Wayne, Maine, 22 Oct. 1842. She studied in Milan, made her operatic début in Copenhagen in 1868, had a successful European career for three years, and returned in 1870 to the United States, where she won great popularity and remained, with the exception of one brilliant European tour, until 1882, when she married Charles M. Raymond, and retired from the stage while her voice was still unimpaired. Since then she has sung only in private or for charity.

Cary, Archibald, American statesman: b. Virginia, about 1730; d. Chesterfield, Va., September 1786. He early became a member of the House of Burgesses, and in 1764 served on the committee which reported the address to the king, lords, and commons, on the principles of taxation; and in 1770 was one of the signers of the "Mercantile Association," which pledged its members to use no British fabrics thereafter, the design being to resist by practical measures the encroachments of the government. In 1773 he was one of the celebrated committee of correspondence by which the colonies were united into one great league against Parliament. When the State government was organized he was returned to the Senate, where he presided with great dignity and efficiency. At this time occurred the incident with which his name is most generally connected. The scheme of a dictatorship had been broached, and without his knowledge or consent Patrick Henry was spoken of for the post. In the midst of the general agitation Cary met Henry's half-brother in the lobby of the assembly, and said to him: "Sir, I am told that your brother wishes to be dictator. Tell him from me, that the day of his appointment shall be the day of his death, for he shall find my dagger in his heart before the sunset of that day." The project was speedily abandoned. He was a good representative of the former race of Virginia planters, delighting in agricultural pursuits, in blooded horses, and improved breeds of cattle, which he imported from England, and attended to with great care.

Cary, Edward, American journalist: b. Albany, N. Y., 5 June 1840. He has long been connected with the editorial staff of the New York Times. His principal published work is a 'Life of George William Curtis' (1894).

Cary, Elisabeth Luther, American writer: b. Brooklyn, N. Y., 1867. She is a daughter of Edward Cary (q.v.), and has published translations from the French of 'Sarcey and Melchior Vogue.' Her own works include 'Alfred Tennyson: His Homes, His Friends, and His Work' (1898); 'Robert Browning; Poet and Man' (1899); 'The Rossettis: Dante, Gabriel, and Christina' (1900).

Cary, George Lowell, American Unitarian theologian: b. Medway, Mass., 10 May 1830. He was graduated at Harvard College in 1852; and was a professor at Antioch College, 1856-62. Since 1862 he has been professor of New Testament literature in Meadville Theological Seminary, Pennsylvania, of which he is also president. He has published 'Introduction to the Greek of the New Testament' (1878); 'The Synoptic Gospels' (1900).

Cary, Henry Francis, English translator of Dante: b. Gibraltar, Spain, 6 Dec. 1772; d. London, 14 Aug. 1844. In 1790 he entered Christ Church, Oxford, and he took orders in

1796. In 1796 he was presented to the vicarage of Abbot's Bromley, Staffordshire, and in 1800 he removed to Kingsbury, in Warwickshire, another living to which he had been presented. His studies while at college had embraced a wide range of Italian, French, and English literature, and in 1805 he gave proof of his Italian scholarship, as well as of his poetic powers, by the publication of the 'Inferno' of Dante in English blank-verse, accompanied by the Italian text. The entire translation of the 'Divina Commedia' was accomplished in 1812, and the work was now published complete, but it lay unnoticed for several years, till Samuel Taylor Coleridge drew attention to its merits. It has since been recognized as a standard English work. Cary subsequently translated the 'Birds' of Aristophanes (1824), and the 'Odes' of Pindar, and wrote a continuation of Johnson's 'Lives of the English Poets,' and a series of 'Lives of Early French Poets.' He was for some time curate of the Savoy, London, and in 1826 was appointed assistant-keeper of printed books in the British Museum, which office he resigned in consequence of his being passed by on the appointment of Mr. Panizzi in 1837 to the office of keeper of the printed books. The government in 1841 granted him a pension of £200 a year as a recognition of his literary abilities, and he devoted himself henceforth to the annotation of a new edition of his translation of Dante, and to editing editions of the English poets Pope, Cowper, Milton, Young, etc. He was buried in Westminster Abbey.

Cary, Lott, American negro slave: b. Virginia, 1780; d. 1828. He educated himself, became a Baptist minister, purchased the freedom of himself and his two children for \$850, and joined the colony sent in 1822 to Liberia, where he performed inestimable services in behalf of the new republic. He was acting as agent with full power when he was accidentally killed while making cartridges for defense against the slave traders.

Cary, Lucius. See FALKLAND.

Cary, Phoebe, American poet and prose-writer, sister of Alice Cary (q.v.): b. Cincinnati, Ohio, 4 Sept. 1824; d. Newport, R. I., 31 July 1871. She contributed numerous sketches to various periodicals; and with her sister published several books, among which are 'Poems and Parodies' (1854); and 'Poems of Faith, Hope, and Love.' She will be longest remembered as the author of the popular hymn beginning, 'One Sweetly Solemn Thought.'

Cary, Samuel Fenton, American politician: b. Cincinnati, Ohio, 18 Feb. 1814. He represented Ohio in Congress in 1867-9; was the only Republican representative to vote against the impeachment of President Johnson; and was an unsuccessful candidate for Vice-President in 1876, on the Independent, or so-called "Greenback" ticket headed by Peter Cooper.

Cary Rebellion, in North Carolina, an outcome of the religious and political disturbances set going by the constitution of Locke and Shaftesbury, whose laws and discriminations survived itself. (See CAROLINA, ORIGINAL CONSTITUTION OF.) One of these, requiring an oath to support the constitution and laws, debarred the Quakers (who were among the most influential of the early settlers, and by no means
